My brother had never lived at the new house. He had, before his marriage, repaired the old castle, very much altered its interior arrangements, added some kitchen offices, laid out a garden, and was now occupied in building a second tower—not exactly resembling the ancient gray building from which the Lady Rachel and her maids had issued, but modernised upon the same idea, and erected at the other end of the long steep-roofed house, the side wall of which he had battlemented. He had also filled up all the old ill-matched windows, substituting correct ranges of Gothic lattices opening from stone mullions. He had been his own architect, and he had done his business well, though probably not very economically; and there was some confusion among the various crooked passages within, leading to the additional apartments, which would have been avoided by an experienced professional man. None of the furniture I remembered was anywhere to be seen. The whole house had been fitted up by a London upholsterer in the classical style of the day. In the drawing-room countless yards of chintz were festooned over the windows by the help of Roman battle-axes at one side, Danish spears at the other, and Turkish crescents in the centre. Uncomfortable chairs, with the slenderest supports compatible with safety, thinly lined the walls—a few plain, high, naked tables among them. A Grecian couch stood on each side of an Egyptian fireplace, where two heavy sphinxes seemed to weigh down the ends of the fender, while headachy caryatides upheld the ponderous front of the grate. My sister-in-law not being musical, there was no instrument; and not being literary, there were no books; and not liking her needle, there was no work. Nicknacks had not come into fashion. A large Indian box for cards and counters, a pair of glass girandoles on the mantelpiece, and a small basket made of pasteboard, ribbon, and gilt paper, into which notes were thrown, comprised the ornamental details of her reception-room. The bedrooms, uncarpeted, and some of them uncurtained, contained little beside the heavy-draperied beds; no extra tables, no easy-chairs, and a scanty washing apparatus. I can't look back on the skeleton rooms of that day without a shudder. There were only two parts of the house I had any pleasure in entering: the nursery, at the top of the old tower, filled with healthy, happy children, presided over by the kindest of Irish nurses—an old family-piece imported with her handsome lady, who, whatever was doing below, managed to keep all right in her own territories; and my brother's study, where, besides the books, plans, prints, maps, and instruments necessary for his own pursuits, stood the only memorial of the past I could discover at the time—the cornered chair in which my father reclined with his pipe after dinner. The dining-room had a prim-looking side-board in lieu of the old beaufet, and a well-covered side-table remained in it the livelong day; for eating went on almost without interruption during all the waking hours. Every guest of every degree was offered refreshment. It was etiquette to decline at first; but, on being pressed, all fell to, beginning with a dram, whatever might be the hour of the day, and generally ending with one, ladies and gentlemen and all—none of the elders of either sex ever tasting breakfast, at any rate, without this provocative to appetite. This being the custom in the parlour, the fashion was of course fully followed in the hall, where bread, cheese, and whisky were served to all comers—two large bottles of spirits per day being the usual allowance. There was a constant coming and going of the family followers, each native of the glen seeming to think it incumbent on him to visit the castle unceasingly, whether he had business to carry him there or not.

It was much the same up stairs. My sister-in-law delighted in company. She welcomed all. The minister, the doctor, the schoolmaster, the better rank of tenant farmers, the half-pay officers, the poor relations, the cousinhood of higher degree—all were welcomed with a warmth of manner which made her peculiarly a favourite among them, and which had contributed, as much as her liveliness and beauty, to atone in their eyes for her foreign extraction. She was unrivalled in her reception of company, putting the most timid at ease, seeming to know by intuition the topics of conversation most suited to her visitors, and the proper distance each rank required her to attend them on their departure. She pressed them to stay, heaped their plates, showed them to advantage, all so easily, that she threw a cheerfulness over her heterogeneous society which her exquisite tact alone could have insured. Add to this no small skill in matters of cookery, and an admirable taste in dress, and who could desire a fitter 'lady' when she was in good-humour. When her temper failed, it was for want of amusement; and as she was at those moments alone, this defect had hardly then been discovered by her many admirers.

My brother and his wife lived in a crowd of company. Besides the unceasing visits of the numerous family retainers, the new roads, opened all through the country, brought them into contact with a large circle of neighbours. Distance is merely comparative; and the High-

land lairds of those days, insulated in a degree by the extent of their properties, thought little of a journey of from ten to fifty miles to visit agreeable acquaintance. Other lairds had conformed to the times as well as the laird of the glen; gay parties were constantly going forward among them. My sister-in-law's heavy coach, drawn by four large horses, driven by a little old man and a smart boy, in jackets and jockey-caps, as postilions, and followed by two outriders, often conveyed us to places which, as a child, I had hardly heard of, where the same extent of hospitality seemed to prevail as in our own modernised castle. In due time these visits were returned: equally heavy coaches, with the same attendance of servants, drove to my brother's open door, setting down in quick succession company most cordially welcomed. Our extending roads had also brought the far-off world upon us. War having closed the continent to the rambling English, they were obliged to wander nearer home; and crowds began to turn their steps towards the then almost unknown Highlands. With introductions, or without, all made their ready way from one hospitable roof to another; not always, by the by, requiting the attentions paid them; for although some of the most valued associates of my after-life date, with me, our mutual regard from the accident of our thus meeting, many a lively companion of our long mountain rambles showed, by their cool recognition of such acquaintance, that the scenes they had so much enjoyed while among them, had left very faint impressions upon their memory.

They were merry days too that were thus easily forgotten. Mornings passed out of doors in exploring the thousand beautiful recesses of our mountain solitudes—pony rides in groups or parties—boating, fishing, climbing steep hill-sides—always surrounded by humble attendants full of anecdote, full of enthusiasm, ready to succour in little difficulties, familiar, yet courteously respectful; for there was a simple dignity in the manner of the Highlander of that day, to be deeply felt, yet not described, which made the society of the merest peasant agreeable to the most polished gentlewoman. Our evenings were mostly spent in dancing, even after all the fatigues of the day: dancing which began in the parlour often ended in the hall, most of the men-servants playing the violin. We were at no loss, therefore, for both a first and second fiddle, and my brother's valet could play a tolerable bass. The periodical balls, too, were never neglected: indeed my brother had added to their number—his wedding-day and the young laird's birth being both duly celebrated. My sister-in-law was the life of all these parties—the boldest in our morning rides, the keenest in the pursuit of all our varied out-of-door amusements: she was the gayest in the dance at night; she had caught, as by inspiration, the flings, and cuts, and shuffles of the Highlanders, cracked her fingers with the best of them, and had taught her own jigs to a set of her peculiar favourites, and encouraged the merry laugh with which the performance of them was greeted. Some of the older people looked back with a grave sigh to the quiet dignity of my mother's slow strathspey with the captain; but the young race growing up half-worshipped her gay successor, who, amid all her fun, never for one instant forgot that she was the Lady. She was taller than my dear mother, slighter made, with dark hair and eyes, and skin of snow, and teeth of pearl. She was quick in all her movements, yet not ungraceful, not even when at her merriest. Her usual morning-dress was a habit which particularly became her style of figure, and her uncapped head of wavy dark-brown hair. For the evenings she had an endless variety of Indian muslin, gauze, and other light materials for dresses, which were the fashion of the day—crossed in full folds over her fine bust, and stretching out in a long train half over the floor behind her.

My brother evidently admired her exceedingly: he permitted her to do whatever she liked: he seemed to be pleased with whatever pleased her, and to agree without reluctance to every plan that she proposed. Yet he was little with her; and I never thought the sort of life they led suited to his natural inclinations. He might be almost said to act the solitary in his crowded house, remaining much in his own study, or wandering alone, or with his different overseers, about those parts of his property he was engaged in improving. He had one constant companion—his little son. The child was seldom absent from his father's rambles: sometimes capering across a stick beside him, sometimes on his Shetland pony, sometimes hand in hand, they would wander the summer's day; and, strange to say, he was appealed to for his opinion on any points at issue between the master and the workmen; and the boy answered readily, and was listened to, and attended to—the factor, forester, and grieve, uniting in deference to him. My brother's pursuits were all tranquil, equally unlike the habits of the baron of old or the modern fine gentleman. Yet, *odd* as the laird was undoubtedly considered, I question whether one of his race ever lived more truly in the hearts of his people. In person he had no resemblance to my father, except that, like him, he was fair. He was extremely polished in manner, and very exact in dress. Being high Tory in politics, he wore powder till long after it had been discarded from the toilets of all but footmen; and he long preserved his queue, tied with broad black ribbon. He always wore stocking pantaloons, Hessian boots, and the red Pitt waistcoat, except in full dress, or when lounging about among his plantations, when he sported a sort of woodman's gray frock, full of pockets, and covered with straps, from which hung an axe, a saw, a large knife, and a hatchet. He took his own levels, laid out his own drains, engineered his own roads, marked out his own plantations, pruned his own trees, built his own house, planned all his cottages, managed his farm, and trained his volunteers. There never was a busier or a happier man. He had no turn for field-sports, yet he had good dogs for his friends, and the proper array of keepers required by the extent of his moors. He cared little for horses, though he rode a handsome charger, and had a creditably-filled stable. His house was rather over than under-servanted, although his independent habits made him personally indifferent to much attendance.

He had introduced many judicious reforms among his people: he employed his own hired labourers, instead of requiring the ancient rent-service; he abolished all rent in kind, with the exception of the kain or duty fowl, which, being also an Irish custom, and considered to be very convenient in such an hospitable household, my sister-in-law had prevailed on him to continue; he had reclaimed a good deal of waste land, and encouraged his tenants to do so likewise; he had also assisted them to drain and fence: in short, he was for his day an improving landlord—a shining light in his darker neighbourhood. His home-occupations were also numerous; for he could draw his plans on rainy days, and when weary of business, he read, or arranged a good library he had collected, or wrote acrostics on his wife's pretty Irish name, which he also Italianised in sonnets to her beauty. He had his soldiers too—a little box of well-arranged battalions, with their attendant flags, officers, and fuglemen, which he placed in different positions by rules laid down for the guidance of such improviso commandants; for he was much interested in the training of his volunteers, and very proud of the inspecting-general's annual praise of the fine body of men he had taken such pains to discipline, without any aid from the captain, who, regarding the whole affair as child's play, hardly even worth smiling at, looked down on the volunteers from the heights of his 'line' recollections with very contemptuous indifference.

I have always heard my brother say that he considered the calling out of these volunteers as the first step in the civilisation of our countrymen: it trained them to habits of order, and cleanliness, and obedience; and roused them from the sort of lethargic indifference to their condition which had so long contributed to their

poverty. The people themselves delighted in the soldiering; it was as second nature to them. They did not take so kindly to all other innovations, conforming to them a little against the grain, 'to please the laird.' Donald Dhu, who was still the grieve, often shook his head over the new modes of management; while Eppie very openly grumbled at the extra cares imposed upon her. With old Bell times had rather improved. The foreign lady—knowing little about yarn, whether of linen or woollen—never failed to praise the finished webs when they happened to fall in her way; but as to the number of yards they had stretched to, or the cuts yielded, or the hanks spun, she left it all to Bell, who therefore guided the wheels at her own pleasure. I had found most of the old family retainers in their places: all who were still left, remained where my father had fixed them. They appeared to me to have improved in many of their habits. My brother, as I have mentioned, attributed much of this to the volunteers, and a little to the roads; and perhaps with reason. But after I had lived for some time his inmate, I determined that he had himself contributed in no slight degree to their advancement. Poetically attached to the past, he was tenderly careful of old prejudices, while insinuating rather than enforcing the practically-useful changes he felt to be necessary. He mixed much with them, listening to every petition, assisting every one in need of help, receiving every application affably, granting cheerfully, denying kindly. He was courteous to all. And though failing in some of his many projects, mistaken in several of his intentions, and unsteady in a few of his undertakings, he was so good-humoured when jested with upon such subjects, that he was rather the better loved for being fallible. There was much of my father's character revived in my brother the laird, and a curious mixture in his manner of my father and the captain.

I am glad to speak again of my uncle the captain. It was one of the sincerest pleasures awaiting me in my native glen to find our good old uncle living, healthy and active as before, and much more happy; for he was married. He had not lived for so long the intimate companion of the worthy Miss Nelly, without discovering how admirably she was fitted to enliven the declining years of an elderly gentleman. Desolate indeed would have been his latter days, after losing the laird's fireside, if he had not bethought himself of the wise plan of contriving a cheerful chimney-corner of his own. The captain and Miss Nelly had therefore made common cause of it after the family break-up. They had settled down where they were, in the big house; first remaining there in care of the place for the young laird—the captain's valuables arriving in detachments from the cottage, as year by year he felt more secure in his new possession, till at last it was formally ceded to him, or my brother determining to fix his own residence at the castle. I found them where I had left them, and almost as I had left them—in the little parlour my mother had always lived in, which was unchanged in all things but the want of the cornered-chair, and the addition to the two swords over the mantelpiece of all the other warlike family weapons which had formerly figured upon the walls of the cottage. My uncle was much less changed in appearance than could have been expected—a little shrunk, not quite so brisk, but hale and hearty, and hospitable as in his less affluent days; for my brother had not been unmindful of the good captain's comfort, and had taken the occasion of the marriage considerably to increase his worldly means. Miss Nelly had changed as little. She even looked better as the captain's lady than she had done as the elderly maiden cousin; for she had imperceptibly acquired a higher composure of manner, befitting her advance in station, while the certainty of her provision had added to the contented expression of her homely features. She continued her thrifty housewifery, storing up gear never to be of use either to herself or to her carefully-attended husband, but which early busy habits had made a necessary exercise of her activity. They seldom entered the upper part of their large house, finding the ground-floor more than sufficient for their accommodation, with help from the garrets. The drawing-room, therefore, remained much as my mother had left it. The bedrooms adjoining had been stript of some little furniture, to add to the capabilities of the castle; but the deserted chambers still retained the look of the old times—a melancholy air of the past to me, but on which the captain commented very gaily, giving, in his comparisons, all the advantages to the present. Happy in his home, looked up to by the people, always welcome at the castle, the evening of life was closing cheerfully on the captain. My brother the laird treated him with the most studious respect. My sister-in-law the Lady liked him above all her new connexions; for, besides that the high tone of his gallantry both amused and flattered her, 'he played,' she said, 'a most capital good game at whist, and he had no objection to bragge or loo when the loo was limited.'

The captain's lady did not exactly follow the times with equal confidence. She never said a word in disparagement of aught pertaining to the family; but there was a certain little nod, followed by a raising of the head, and a screwing of the mouth, which very plainly indicated that, though it was not her part to condemn, she did not by any means approve. She had a dry habit of repeating any remark she did not think it proper to answer; which I never heard without uneasiness, and which years after recurred to me as prophetical warnings of all that her sound common sense enabled her to foresee. 'My brother has such fine children, dear aunt'—'Such fine children, niece.' 'What a large meadow he has drained, aunt'—'Drained, niece.' 'This unexpected demand for wood will make his fortune; so many sawmills; such a felling of timber'—'Such a felling of timber.' 'He is so happy with his young gay wife'—'Young gay wife.' She almost provoked me with her perpetual wet blanket thrown over those brilliant days. The captain's lady and the laird's lady hardly got on well together; yet there was no open variance. The aunt bore with the niece; and the niece, in spite of herself, looked up to the aunt, and in manner treated her with particular deference. Indeed there was an infinity of ceremony between them. At their visits the one rose and advanced to receive the other, placed the honoured chair, made the greatest parade of refreshments; and on the leave-taking, there was such conducting and reconducting, that I have known them pace the same bit of the road for half an hour before politeness permitted them formally to separate. My sister-in-law would then skip gaily back, as if for the day relieved from duty; while the captain's lady, with the mouth well screwed up, moved stately home without a glance on either side.

The cottage deserted by the captain had been given to the factor, a person whom the increasing business of the property had rendered a necessary assistant to the laird. This responsible agent united the employments of factor and head forester—the manufacture of the fir timber growing in the upper part of the glen having then just risen into a very important branch of the economy of Highland estates. He was chosen for the management of my brother's affairs for a thoroughly Highland reason—the having been particularly unfortunate in the care of his own. He was one of the far-away cousins with whom nothing had ever prospered; and having an equally ill-managing wife, with a large family of children, it was matter of necessity for the head of the house to provide for them. A second cottage, at a little distance from the first, was built for the children; a distant maiden cousin, an inferior Miss Nelly, provided to look after them; and, with a little plenishing, gathered among the better-off family connexions, the factor settled down for life, in thorough happiness, on one of the prettiest of the many lovely nests stolen, as it were, from the birchwoods. His principal merit was his very beautiful playing upon the

violin, being little inferior to old Niel Gow himself in the tones he drew from the instrument, and the expression he gave to the more melancholy airs. It was no small treat to hear such music. The only person insensible to his genius was his wife, who had little patience for any kind of harmony, for she passed her days regretting the tea and card parties of the provincial town in which her husband's mercantile speculations had failed. His most devoted admirer was the under-forester, also a new acquaintance to me. He was a stranger, brought from some wood-cutting district to set my brother's saw-mills properly agoing—a little handsome Highlander, the best dancer, the best ba' player, the stoutest walker in the country—he gained all the men's hearts, and broke half the lasses', making great impression even on mine; for I liked no one so well to guide my pony's steps on our excursions as the handsome forester, who, child of nature as he was, had the tastes of the highest order of minds. His enjoyment of scenery was intense; his descriptions, as he translated them from the original Gaelic of his thoughts, quite poetical; his observations on the world without, and on the little world around—more interesting to him—were those of the acute, feeling philosopher; the results of a little good reading and much reflection, his half-solitary life throwing his mind back upon itself, except when casually encouraged to open its stores to another. I have often since, when most interested in the go-ahead progress of our awakening age, thought of what my brother's forester would have said on passing events—what shrewd remark of his would have penetrated the perplexities encompassing the new lights which are shining on us. And I have always felt that I never passed hours of higher enjoyment than when—wandering through the forest on a long summer's day, my pony's certain foot crushing the fragrant heather, the burnie dancing along its rocky bed, the straight pines now enclosing us from the day, now opening on some sunny croft or glade—I had for my chief companion this nature's gentleman, a character in that day by no means rare in the Highlands.

I love to remember the glen as it then was in its rude beauty. Miles and miles away from any market-town; its own resources almost sufficient for its few wants; news very scanty; the post but twice a-week, and sent for to the clachan; not a bridge over the many streams which flowed along the thousand sequestered dells—beyond a plank, often without a hand-rail—for foot-passengers; bolts, and bars, and locks unknown, even to the castle doors and windows; and the people so dependent on, yet independent of, their chief, coming to him as to a father, paying him the respect of children without any of the submission of servants. I particularly liked the Sunday, for it was a day of cheerful rest at that period among the Highlanders, when all gathered in the barn-like kirk, oddly enough situated on a promontory running out into the lake—the most far-away point at the southern extremity of the estate. Yet, distant as it was from the upper end of the glen, few failed to attend the service: not from any particular veneration for the preacher, who, worthy man, troubled himself but little about doctrinal matters in his addresses to them. It was more a family reunion, which all assisted at in their best attire, with their happiest faces. The laird's large pew was opposite the pulpit—his servants all behind him. The captain and his lady on the one hand—the factor with his town-dressed wife and dozen rosy children on the other. The grandees being thus disposed of, the rest of the congregation fell into suitable places without much pre-arrangement. It was a beautiful assemblage. There was the old white-headed man, the rugged lines of whose countenance seemed softened by his flowing silvery locks; there was the dark, gray-sprinkled, middle-aged head near him, the thoughtful features beginning to contract into the furrows lengthened years would deepen; and there was the young, gay, joyous face, where the bright eye flashed, and the raven curls waved as in triumph over the quiet-looking sandy-haired rival at its side. The plaid enveloped all; really wrapping the aged, it decorated the young, being thrown across the shoulder with a jaunty air, the peculiar fling of which seemed to have been caught from my friend the forester; for much male coquetry was displayed in its arrangement. No wonder; for how many modest eyes stole a glance at by moments towards the smartly-belted plaid. The young Highland girls were particularly comely: their fine skin, their healthy colour, their neatly-dressed hair, smooth and bright, braided over the forehead, bound by the snood, and turned up *à la grecque* behind; with the homespun gown, neat kerchief, bright scarlet plaid, and a string of glass beads, or a narrow band of black velvet tightened round each fair throat, made perfect pictures of these mountain beauties, who seldom shackled their well-developed feet with either shoes or stockings. The matrons, however young they married, all wore high-crowned caps: snow-white muslin steeples, almost vying in height with the Norman peasant woman's cap, filled the kirk; deep lace borders, shading features which, though bonny enough in the bride, family cares, hard work, and exposure to weather, soon rendered sufficiently homely. To the high cap the wives added an outer shawl over the kerchief, and the universal plaid; which became graver in its many colours as the wearer advanced in years, till it looked little better than a chequered blanket with the very aged. It was a curious scene, but not a quiet one; for the dogs had their part in it—these faithful attendants never in any circumstances deserting their post beside their masters.

The minister was not my old friend with the good stories, but a tall, spare man, absent in manner, confused in ideas, and who frequently, for lack of higher matter, interlarded his sermons with the current news of the day. Every door in the glen was open to him; for all the people loved a quiet chat with the worthy man, who was equally welcome at the castle as at the cottage, both my brother and my sister-in-law really liking his society. The number of cups of tea he could swallow was his most remarkable peculiarity. I have seen my wicked sister-in-law offer him, in succession, near a dozen, prefacing each with the remark that he always liked a *third*. The only part of his clerical duties which much interested him was the school my brother had established, and which, being left to the master's sole guidance, who educated boys and girls together, was far from working out as much good as was intended. The Bible and the Latin language occupied the poor children taught in it nine or ten years of their young lives. Seven hours a day of toil, unmixed with play, but plentifully seasoned with birch, by help of which it turned out several very fair scholars, to whom my brother gave Goldsmith's works as prizes.

The only remaining subject connected with the glen in my brother's time was his arrangements for the sick. My mother's skill in medicines not having descended on her successor, he had agreed with the garrison surgeon of the neighbouring fort to visit once a-week at the castle, where a room had been fitted up as a dispensary. Thither all who were able came to consult the doctor, and to those who could not leave their home, one of the laird's horses carried him. A dinner and bed on these occasions, and L.10 a-year, fully remunerated this clever entertaining man for his day's work, as he had the chance of practice among the rich by the way. By his directions my brother administered the necessary medicines, and the equally necessary nourishment during his absence, till he grew to great skill in most of the diseases incident to his people; nay, was considered by many of them to be much more successful in his mode of treatment—the old feudal feelings inclining them to favour the laird.

I must mention my aunts before taking leave of the glen, as I saw them both during this visit. Their lairds were gone, and they were widows. My Aunt Penuel had left her son's house, and taken up her residence in the provincial town, where she sent me word she should

be very happy to receive me, if I had time to spare, but that she was too infirm herself to undertake journeys, though she was some years younger than my Aunt Grace, who crossed the lake the first week of my arrival, bringing her eldest grandson with her, the head of another hopeful flock. Her own family were all dispersed about the world, with the exception of one daughter, who she said remained to nurse her. She lived on in the old place with her son the laird, whose wife she spoke of as a sort of angel—her own kind heart inclining her to see but good in every one. My Aunt Penuel's family had all been settled much more brilliantly. The eldest son had married nobly, the second richly, and the third was in high military employment; the daughters had been bestowed on the greatest houses in the neighbouring north. But our connexion with them seemed to have been broken, as I hardly saw any of them during this gay summer; while those of my Aunt Grace's family, who had continued near at hand, came and went perpetually, as still belonging to their mother's race. It is all like a dream to look back on, so different from the ways of the world we live in were the habits of those days in that distant glen. What a revolution in manners, even there, has one life of ordinary length witnessed! But the completion of this series of contrasts must be the subject of another paper.

CRIMINAL STATISTICS OF FRANCE.

Judicial statistics have recently excited much attention in Britain, and deservedly so, as it is now clearly perceived that a large accumulation of facts is an indispensable preliminary to the satisfactory solution of many social problems, and to safe and satisfactory legislation. It is interesting to inquire whether some of the conclusions already arrived at are corroborated by the experience of investigators in other countries than our own; and to none can we turn with more expectation of profit than to those of France, where inquiries of this description have been pursued for a considerable period with diligence and success. A valuable document was issued by the government of that country at the beginning of the present year; namely, 'A Statement of the Administration of Criminal Justice in France during the year 1843.' It is an immense quarto volume, which, like so many of the 'blue-books' in our own country, would deter, by its very bulk, any but persons fully impressed with the importance of the subject from approaching it. Professor Michael Levy has, however, furnished to a French periodical an analysis of the more interesting conclusions, some of which, with a few of the remarks which accompany them, we proceed to submit to the notice of our readers.

1. *Age of the persons accused.*—In each annual report this is observed to be remarkably similar, a fact whose explanation appertains as much to the domain of the physiologist as to that of the statesman. The ages of the 7226 persons tried in 1843 were as follows:—66 were less than sixteen; 1170 between sixteen and twenty-one; 1122 between twenty-one and twenty-five; 1171 between twenty-five and thirty; 1048 between thirty and thirty-five; 819 between thirty-five and forty; 1165 between forty and fifty; 433 between fifty and sixty; 186 between sixty and seventy; 44 were septuagenarians; and 2 were octogenarians. Of 100 persons accused of crimes against the person, only 13 were of less than twenty-one years of age; while the proportion of such accused of crimes against property was but 10 per cent. More aged persons are likewise accused of crimes against the person than against property. It is during the reign of the passions, and the perfection of his physical organisation, that man tends to transgress the limits of justice and honesty. A sad lesson it is, that during the most flourishing period of the exertion of his free-will, man most frequently violates the laws of society, and is subjected to the greatest number of fatal errors.

2. *Sex.*—The proportion of the sexes among the accused is remarkably uniform. From the year 1826, the number of women accused has never exceeded 20 per cent., nor been less than 16. The crimes most frequently committed by them are infanticide, concealment of birth, abortion, and then poisoning. With respect to this last, M. Levy observes—'It would be interesting if we could ascertain to what degree *imitation*, so active among women, has contributed to augment the annual total of poisonings. It cannot be denied that the publicity given to certain trials, and the almost flattering curiosity exhibited towards some of the heroines of the assize courts, have acted upon many an imagination, exalted the secret passions, and excited wicked ideas in minds ill-contented with their position, or the subjects of conjugal hatred.'

It is a curious fact, that in the country where the social emancipation of woman has least advanced, the smallest number of female criminals is found. In Corsica—where the wife does not even sit at table without the permission of her husband, and where she is subjected to severe rural and household labour, obliged to receive the law from her husband, and only remotely participating in the benefits of civilisation—there is annually a smaller proportion of women sent to the assizes for trial than elsewhere. Thus, in 1843, of 112 prisoners, not one was a woman. A Christian resignation to the sufferings of their condition, a great purity of mind, pride of character, fidelity to legitimate affections, and a deep sentiment of duty, are traits which an impartial pen cannot refuse to these noble Corsican women, and which render the rarity of their appearance before the tribunals nowise surprising. Among the other departments which exhibit few women in their criminal returns, are the Pyrenees Orientales, La Haute Marne, Maine et Loire, and the Puy de Dome; while other provinces, which are at the head of the national civilisation, as La Moselle, La Meurthe, Les Vosges, &c. present a much larger proportion. In the department of the Seine, there are always 17 per cent., which is the mean number of the entire kingdom.

3. *Marriage.*—As women commit fewer crimes than men, we might conclude, *à priori*, that the living together of the two sexes in the state of marriage must exert a favourable influence upon the morality of men; and the statistics prove the justice of this opinion. Of 100 male persons tried in 1843, 57 were bachelors, 40 married men, and 3 widowers. Of 100 females, 52 were unmarried, 36 married, and 12 widows. It has been elsewhere shown that unmarried persons also offer the greatest amount of mortality, suicides, and insanity. It is always in those departments which contain the most populous towns that the proportion of unmarried criminals is found greatest. Among the accused persons, those who have been born out of wedlock, and those who have had natural children, form a large proportion. The dreadful mortality of very early life chiefly occurs among these unfortunate illegitimate children; while of those who survive, a large proportion go to swell the calendars of crime.

4. *Instruction.*—Of the 7226 persons who were tried in 1843, 3719 were completely illiterate; 2316 could read and write imperfectly; 955 derived some advantage from these accomplishments; and 236 had received a superior education. Upon this table M. Levy remarks—'We observe, then, how few persons really instructed are upon the lists of criminal justice. A superior education acts preservatively by multiplying the resources of existence, and rendering it needless to resort to unlawful means, as also by elevating morality proportionately to information, and producing a salutary reaction of the intellect upon the conscience. Let there be an end of blaspheming the intellect, and of doubting the result of cultivating the understanding. When the culture is complete, it produces excellent fruits. Ignorance is a near neighbour to crime, and seems to induce it; for if we place in one category the illiterate persons, and such as had only an imperfect

notion of reading and writing, we find it alone represents 83 per cent. of the entire number of criminals.'

5. *Occupations.*—Of the 7226 persons, 6102 exercised some calling, or possessed means of living. 'This result conveys an important lesson to those whose ideas on the reformation and amelioration of the condition of the masses are limited to providing for their material wellbeing. The certainty of provision for to-morrow does not seem to be a preponderating element of the moral manifestations of man; for five-sixths of these persons belonged to the class of persons gaining a livelihood by their occupations, or whose condition in the world was such as enabled them to dispense with labour. The nature of the occupation exerts considerable influence. Thus the manufacturing classes, taken generally, furnish 33-hundredths of the entire number; persons engaged in the sale or transport of goods, 12·; the united classes of inn and coffee-house keepers, lodging-house keepers, and domestic servants, 10·. But the manufacturing population is surpassed in number in the criminal tables by persons engaged in agricultural pursuits, which of all classes commits the greatest amount of crime, and whose numbers amount to 35·.'

6. *Seasons.*—The social system, as well as that of individuals, seems subjected to a law of periodicity. The regularity, almost the fatality, of the variation of the amount of births and deaths, is remarkable amid a variety of causes which would seem to dispose to the greatest fluctuations. And even crimes seem to observe a certain order in their distribution over the year. In winter and autumn, those against property increase in number; while, during summer and spring, those against the person preponderate.

7. *Locality.*—It is in the southern departments [the most rural] that crimes against the person prevail, and in the central, eastern, &c. departments [where there are most commerce and manufacturing industry] that those against property predominate. Two departments always stand at the head of the melancholy list; namely, Corsica and the Seine; the first in the department of crimes against the person, which are as 90 to 10; the second for crimes against property, which are nearly in the same proportion; namely, as 89 to 11. Respect for human life is undoubtedly the best measure of the civilisation of a country. If property be seldom attacked in Corsica, it is because the soil is fertile, the population small and of temperate habits, pauperism almost unknown, wants limited, tastes simple, and luxury confined to the towns on the coast; but the lower passions, such as hate and vengeance, disturb these fiery natures; and an island that seems to enclose within its shores a race of geniuses and heroes, is horribly saturated with the blood of her children, who slay each other in part from habit, and in part from a false notion of honour. On the other hand, in a large city, such as Paris, where wealth and poverty are brought together, the leading temptations have reference to property.

8. *Relapses.*—This is the most important of all the questions connected with these statistical tables. In 1843, as in 1842, one-fourth of the persons tried at the assize courts were relapsed criminals. Of these, 166 had been formerly condemned to hard labour; 90 to seclusion; 607 to a year or more of imprisonment; 911 to less than a year; and 40 to a fine only. The number of relapses has progressively increased from 1826, when it was 11 per cent., to 1843, when it was 25 per cent. Women have, however, only furnished 8 per cent. Crimes against property are always followed by a greater number of relapses than crimes against the person. It is important to determine the influence of the central prisons (*maisons centrales*) and the hulks (*bagnes*) upon the number of relapses. An examination shows, that of 6841 convicts who quitted the three bagnes of Toulon, Brest, and Rochefort, during ten years (1830–9), 1753 —26 per cent.—were tried for new crimes within five years of their liberation; while of 54,192 persons discharged from the central prisons, 15,881—more than 29 per cent.—were apprehended again within the same space of time. In both cases the number of relapses has increased from year to year. Two facts are worthy of notice—1st, That more than three-fourths of the relapses in those discharged from the central prisons—as also from the bagnes—occurred within the two first years of their liberation; and 2d, The relapses were rather more frequent among those discharged from the central prisons—who had sums of money exceeding 200 francs in their possession—than in those who, when discharged, received less than twenty francs. 'If the relapses had occurred at a more remote epoch, we might have attributed them to the intervention of new causes powerful enough to destroy the work of moral redemption, which had been attempted to be produced during the detention. But the early period of their occurrence testifies not only to the uselessness of the detention as a means of reformation, but even also to the increase of the moral perversity by the contagion to which it has been exposed, and which only seeks occasions for breaking out into new crimes. In the same manner, the savings from wages during imprisonment—which should, on the discharge of the prisoners, be a means of obtaining employment for them, and the recovery of their position in society—are dissipated in orgies which are but the preludes to new crimes. Nothing is better proved than the endemic moral pestilence of these central prisons and bagnes. Their only effect is to sequestrate and deprive the criminals of their liberty. But should our efforts at repression be confined to this? Is the external and apparent expiation of the crime to be our only objects? Has society no other duty than that of striking, without correcting? Far be it from us to recommend the mere conversion of places of legal expiation into schools of instruction in morals and labour, where more care would be lavished on the education of criminals than upon that of the poor children of the people; where, fed, lodged, clothed, warmed, provided with books, and surrounded by masters and consolers, they would only require a little patience to pass through their period of sequestration. Neither the one nor the other is desirable! Chastisement alone does not meet the wants of society; the progress of civilisation alone would change the character of prisons, and soften the vindictiveness of the laws. Let us unite the two conditions. Do not allow legal vengeance to annihilate the moral being in the prisoner. Instruct, ameliorate the condition of the man who has violated human and divine laws; but let him never forget whence he has come, and the expiation which his crimes have rendered necessary.'

STORIES AND TRANSLATIONS FROM TASSO.

It is surprising how little the general reader is acquainted with the peculiar beauties of a poem whose title is as familiar as a household word—the 'Jerusalem Delivered' of Tasso. The unlearned lover of poetry takes alarm at the formidable appearance of a voluminous translation in blank verse—certainly an unwise mode of conveying a just idea of a poet whose chief beauty consists in the liquid softness and imitative harmony of his rhyming stanza. The commonplace Italian scholar is often disinclined to resume the study of the twenty long cantos through which he wearily toiled in the days of his noviciate, in search of beauties which were then unappreciated. The *Gerusalemme*, like Spenser and Chaucer, is scarcely suited for continuous study; a few dazzlingly-beautiful passages, and some touching episodes, are succeeded by lengthy and tiresome descriptions; even the sweet rhythm of the verses adds to their wearisomeness. To interest the every-day reader, these gems with which the poem is studded require to be pointed out, and the thread of a story followed from canto to canto, where it has been discontinued and then resumed, so as to make a perfect whole. Begin we then with the first episode introduced, and nearly, if not quite, the most beautiful—the story of Sophronia and

Olindo—giving the substance of the less interesting passages, and translating almost literally the stanzas which are richest in the charms of poetry.

The army of the Crusaders is leagued round the Holy City, within which are besieged a mixed population of Christians and Mohammedans. The Mussulman king is advised by Ismeno, an apostate Christian and magician, to carry away from the Christian church the veiled image of the Virgin Mary. 'Then, O king!' says he, 'place it with thine own hand in the mosque. I afterwards will work so strong an enchantment, that while the image remains, thy city will be secure.' The tyrant was persuaded. Impatiently he rushed into the house of God, and irreverently snatched thence the image, and bore it to the mosque, where, over it, Ismeno muttered his charms. But when day broke, the statue had disappeared: they sought it in every place, but in vain. The enraged king imagined that some one of the Nazarenes had stolen and hid it. 'But,' adds the poet, 'whether the deed was the work of a faithful hand, or whether Heaven exerted its power to snatch the sacred image from pollution, is still unknown: faith and piety ascribe the mystery to God.' The tyrant searched the houses and churches of the Christians, offered rewards, and threatened punishments—the truth remained unrevealed. Then he ordered that the faithful should be pursued with fire and sword; that, innocent or guilty, they might meet an equal death. Fearfully the Christians heard; the terror of death fell upon them; they attempted neither defence nor flight, neither prayers nor courageous opposition. But in their utmost peril a deliverer arose—a maiden of their own faith.

She was a virgin in ripe womanhood;
Rich in high thoughts and noble, very fair;
But from herself the loveliness all viewed,
Unseen, or else unheeded, won no care
Save modest pride; within the solitude
Of her close home she hid her beauty rare;
Flying from idle gaze and flattering tone,
She sheltered there, unworshipped and alone.

But never yet was earthly wall or prison
Of power such loveliness unwon to hide:
Forbid it, Love! who gav'st her to the vision
Of one who for this fairest maid long sighed;
Love—who now blind, now Argus-eyed—thy mission
Perform'st with glances veiled or darting wide,
Who through a thousand guards that would thee slay,
Unto a maiden's bower canst pierce alway.

Sophronia she, and he Olindo was;
Both of one city, both one faith: the youth
Modest, as she in beauty did surpass;
Wished much, hoped little, nothing asked, in truth:
Doubt, fear, restrained his tongue; and she, alas!
Saw not his love, or else with hard unruth
Despised it; so his hopeless passion burned
Unnoticed, or contemned, or unreturned.

The virgin hears the murderous command, and resolves to devote herself for her people. Timidity and maiden shame strive with noble courage: at last the latter triumphs.

The maiden from the crowd went forth alone;
She showed not her meek beauty, nor concealed;
Her eyes bent down, her veil around her thrown,
She moved in noble purity revealed;
Whether adorned or careless, none had known,
If art or nature did the victory yield;
Her negligence was artifice divine,
Given by nature, love, and Heaven benign.

Winning all eyes, herself regarding none,
The noble virgin passed unto the king;
Nor shrank back, though she saw his wrath begun,
But an undaunted heart did thither bring.
'I come, sire, to reveal the guilty one,'
She cried; 'I pray thee cease from punishing,
And rein a while thy people's frantic rage,
Till on one head thou mayst thy wrath assuage.'

At such unwonted boldness, and yet mild,
At the swift lightning of such dazzling charms,
The king, confused, half-conquered, and beguiled,
Restrains his wrath, his angry frown disarms.
Had the severe and cold proud virgin smiled,
His tyrant soul had felt love's soft alarms;
But beauty, cold, charms not a heart so rude,
And tender graces are love's sweetest food.

It was not love; 'twas wonder and delight
That moved a while the tyrant's bosom stern.
'Declare the whole,' he cried; 'my vengeful might
Against thy Christian nation shall not burn.'
Then she—'The guilty one is in thy sight;
The work is mine; this hand thou dost discern
Stole the fair image, hallowed and most dear!
Thou seek'st the guilty—punish! I am here!'

So unto death she bowed her noble head,
And wished alone her people's doom to bear.
Oh virtuous falsehood, to such motives wed,
That may with beauteous truth itself compare!
The king remained aghast, astonished,
Nor yielded to his wrath so quickly there
As he was wont, but softly bade the maid
Reveal who counselled her, and gave her aid.

'I would not share the glory of the deed
With any one,' she answered; 'I alone
Conceived the work, which Heaven made succeed;
The thought and the performance all mine own.'
Cried the fierce king, 'On thee, thy nation freed,
Shall fall my wrath, and for such guilt atone:'
She spake, 'Tis just; as I with none did share
The honour, I alone the doom should bear.'

Then hotter grew the furious monarch's ire;
'Where hast thou hid thy theft?' he fiercely said.
'I hid it not; I burned it up with fire,
Rejoicing, as the holy flames outspread,
That unbeliever's hand might ne'er come nigher,
Or with vile touch pollute that sainted head.
Seek'st thou the robber? Lo, king, I am she!
The sacred theft on earth thou'lt never see.

And yet no theft it was—no thief am I;
I but restored what by foul wrong ye took.'
The intrepid maiden spake, and wrathfully
The tyrant all restraint from passion shook.
Ah! hope no more to find a pitying eye,
Thou modest heart, high soul, and angel look!
While of thy peerless beauty all revealed,
Vainly love tries to frame a powerless shield.

The gentle maid they seize; the ruthless king
Dooms her to perish on the raging pyre.
Already her chaste veil they from her fling;
Her arms they chain, which no such bonds require:
Fearless, though mute, she stands, unmurmuring.
A little is the strong heart moved as nigher
Steals the dread hour, and the sweet face does wear
A hue which scarce is pale, but purely fair.

The wondrous rumour grows; the people throng
Unto the scene, Olindo 'mongst the rest.
The deed was known—the doer uncertain long:
Little he deemed 'twas she he loved the best.
He saw the beauteous captive bound among
Her guards, her doom on every face expressed:
Darting, he madly dashed the crowd aside,
And rushed before the monarch's throne of pride.

'O king, this maid is innocent,' he cries;
'The deed she madly boasts is not her own:
How could a feeble girl the theft devise,
Or execute, unaided and alone?
Or how elude the guards' unwearied eyes,
And steal the image? Let the deed be shown:
If true—I, only I, the work have done.'
Alas, so well he loved the unloving one!

Olindo then repeats a feigned tale of how he, at dead of night, climbed in by the opening which admitted light and air into the mosque, and secretly conveyed away the image. He concludes by passionately claiming, as his just due, the chains and the burning pile which threatened his beloved. At these wild exclamations of her lover—

Sophronia raised her head, and on him bent,
Compassionately, her sweet gentle eyes:
'Why art thou here? for thou art innocent:
Whose counsel sends thee in such frantic guise?
Can I not without thee in this fate blent,
Endure whatever man's fierce anger tries?
I also have a fearless heart and brave,
Alone to dare the torture and the grave.'

So spake she to her lover, heeding not
If he replied, or silence did maintain.
Oh noble sight! when for such bitter lot
Virtue and love contending strive in vain!
The victor's meed, to be in death forgot,
And safety, held the vanquished utmost bane.
But fiercest raves the tyrant as he sees
How each, assuming guilt, the other frees.

The king, imagining that by this noble strife between the two young Christians his authority is contemned,

orders both to be united in one fate. The youth is bound to the same stake as his beautiful mistress, being tied so that face is hidden from face.

Around them does the fatal pyre arise,
Already creep the stealing flames above,
When the sad youth broke forth in mournful cries,
And said to her he loved, with such deep love,
'Is this then the sweet bond—are these the ties
With which, entwined with thee, I hoped to move
Through life? Is this the ever-burning fire
That once I thought would our twin hearts inspire?

Love promised other flames and bonds than these,
To which most cruel fortune makes us bow;
Too much she severed once our destinies,
And mournfully at last unites them now.
My soul in this one thought some comfort sees,
In death, if not in life, my spouse art thou;
Beloved! only for thy fate I sigh,
Not for mine own, since at thy side I die.

And oh! how fortunate my death would be,
How blissful all these burning tortures were,
If I, close fettered, face to face with thee,
Might breathe my spirit on thy lips so fair;
And thy sweet soul could likewise mingled be
With mine, together our last sigh to share!'
Weeping he spoke; she answered mild and sweet,
And in these words she gave him counsel meet:

'Friend, other thoughts thy last sad moments claim;
Other laments than these to thee are meet;
Think on thy sins, with meek and contrite shame,
Remembering Heaven's promised guerdon sweet:
Pain will be light, if suffered in God's name,
And joyful thou shalt reach thy heavenly seat.
Look on the glorious sun, the shining sky,
They welcome thee to immortality.'

At these words even the Pagans wept aloud: the Christians dared not show their grief. The tyrant's heart was strangely moved: he would not yield, but turned away from the scene. Sophronia, alone the object of so many tears, wept not. Suddenly there appeared at a distance Clorinda, the maiden warrior, who had borne victorious arms from her earliest youth. She, seeing the preparations for death, and curious to know the cause, spurred on her courser to the scene.

The warrior-virgin pierced the yielding crowd,
Nearer to view the twain together bound;
One silent, calm; the other groaning loud;
And in the feebler sex most courage found.
She sees the youth in helpless anguish bowed,
In pitying love all selfish error drowned;
And fixed on heaven the maiden's saint-like eyes,
She seeming half celestial ere she dies.

Clorinda's woman-heart was melted with compassion; a few unwonted tears fell from her eyes—tears shed for the one who herself did not weep; for silence moved her more than lamentations. Without delay she turned to an aged man who stood by, and inquired the reason of such a punishment. All was declared: and immediately Clorinda guessed that both the lovers were innocent. She boldly extinguished the rising flames, and ordered that the fate of the condemned should be deferred until she had spoken to the king. The guards, struck with her regal port, silently obeyed, and the Amazon advanced to the king. 'I am Clorinda,' she said; 'thou mayst have heard my name: I come to defend thy kingdom and our common faith against the Christians.' Courteously and gladly the king received the noble warrior, whose fame had spread everywhere; and she, as the reward of her promised aid, asked of him the life of the innocent condemned ones. The monarch wished to conciliate her, and her prayer was granted. 'Let them have life and liberty,' he said; 'I can deny nothing to such an intercessor. Be it justice or clemency, I free them if innocent—I pardon them if guilty.'

So they were freed. Adventurous, in sooth,
Olindo's fortune was, that showed through pain
His love; and in a bosom full of truth
And noble thoughts, awakened love again.
From pyre to marriage-altar went the youth
With his fair spouse, no longer loved in vain:
For her he feared not death itself to dare,
Therefore with him she willed her life to share.

So ends this beautiful episode of courageous virtue and devoted love. It is said that Tasso, under the guise of Sophronia, portrayed his own mistress, the Princess Leonora, in person and mind; and himself as the hopeless Olindo. Critics often discover recondite meanings, of which the author himself never dreamt; yet it is pleasant to believe that so lovely an image of womanhood came from the poet's own heart—the hidden source of all true poetry, however it may be interwoven and disguised from the world's eye. Sophronia, in her perfect purity, her fearless self-devotion, and her pious faith, forms a beautiful contrast to the wars and tumults in which the poem abounds. D. M. M.

FIRESIDE CHIT-CHAT.

NO. VI.

They talk of public monuments, titles, and other weighty matters.

Stukely.—I have just come from a walk through Westminster Abbey. What a glorious old pile that is—what a number of heart-stirring monuments to great men!

Gilaroo.—Some of the monuments are deserved; nearly all may be considered fine workmanship, with here and there instances of a poor taste; but a great many, both there and in St Paul's, are intended to preserve the memories of men who are either lost to fame, or had better be forgotten.

Stuke.—Forgotten! Why, if they are in any danger of being forgotten, the monuments serve to keep them in remembrance. This is just the purpose of monuments. Is it not a fine thing to see a people thus taking a pledge, as it were, never wholly to cease being grateful for the merits of its great men?

Gil.—If the subjects of the monuments were, in general, real benefactors to their race, there might be little to say against them. But in ninety-nine cases in the hundred, public monuments are commemorative either of men who have done nothing to deserve lasting gratitude, or of persons whose lives were positively disreputable. Kings are put into brass or marble, no matter whether good, bad, or indifferent. There are as many, I believe, of Charles II. and George IV., two selfish sensualists, as of any better monarchs. The next class in frequency are the successful commanders. Few are those designed to honour the quiet triumphs of literature or philosophy. But it is needless to complain of the selection of personages; for it is not made by anything like a deliberate choice of the nation. A set of persons club their funds to celebrate by these means a king or minister whom, as party politicians, they admire. Another set raise a statue to *their* favourite hero. This is the way that monuments are usually got up. As an expression of the public voice, they are nearly useless, and the public has no responsibility about them.

Stuke.—Well, however erected, are they not calculated to be of use in stimulating men to worthy deeds, conveying, as they do, the impression that no extraordinary doings in the public service will be overlooked by one party or another?

Gil.—I am loath to sanction such a principle, because the love of such distinctions is a motive of only a secondary class, and the persons most susceptible of such an influence are not the most worth having as public servants. A truly great and worthy man needs no such bribe to make him perform meritorious deeds; while a bad man is certainly undeserving of any mark of remembrance.

Stuke.—That is as good as saying there is no need of monuments at all?

Gil.—Very nearly so, as matters stand. Supposing, for the sake of argument, that the erection of public monuments is good in principle, the way to proceed would be to poll the intelligence of the nation as to the propriety of all existing monuments, and also as to supplying monumental deficiencies. We might then expect to see all monuments to bad men removed as a national scandal, and numerous new monuments erected as a national honour. At present, the whole thing, I

say, is a burlesque—a jumble of principle and no-principle. Monuments to men of worth erected within a stone's throw of monuments to men whose reputations are the pollution of history.

Stuke.—At all events they are generally ornamental. A statue erected on the top of a fine Corinthian column is a handsome decoration to a street or square.

Gil.—So, I daresay, was the golden calf which the Hebrews took a fancy to set up as an object of worship—a very handsome piece of workmanship, a fine specimen of the arts, really a pretty-looking thing. But handsomeness is no reason for adoration. A monument may be elegant and ornamental; but if it be the impersonation of a vicious or discommendable principle, it is worse than buffoonery to set it up—its exaltation is demoralising. I believe, however, that monuments are generally of little consequence one way or other. After the novelty of looking at them is worn off, they appear to be unheeded, and are of no more account than so many stocks and stones; which they in reality are. Of the myriads who daily stream past Charing Cross, how few look at or think of the equestrian monument which has there been for ages erected! It is thus that the ordinary pursuits of mankind, the obliterating effects of time, and the novelties of the passing hour, render all our schemes of perpetuity abortive.

Stuke.—You would not, however, say the same thing of the private and well-kept monuments in churchyards?

Gil.—Alas! yes, and much more. I grant that it is an amiable feeling in the main which prompts people to raise stones over the remains of their deceased relatives. It gratifies a yearning of the heart; and we must not be too severe in scanning and estimating such foibles. But it often seems to me as if more pain were incurred by seeing the neglect into which all such monuments fall in a little time, than there can be pleasure in erecting them. In no churchyard have I ever seen a tombstone three hundred years old: seldom do they reach two hundred; and often, in fifty or sixty years, they are mutilated, thrown down, or altogether removed. This tells me such a tale of the fleeting nature of human feelings, and perhaps, I may add, of the vicissitudes attending the fortunes of families, that I could almost wish that no such 'frail memorials' were erected over the dust of the dead. I sometimes think that a churchyard may be compared to an inn, which is constantly receiving new guests. The last comers banish all traces and recollection of their predecessors.

Stuke.—I have been told that Quakers never erect tombstones or monuments of any kind?

Gil.—Such is the case; and this is not the only thing in which that orderly and intelligent body, the Society of Friends, have got the start of the public generally. They protested against war, with all its wickedness and misery, more than a century before the rest of the world. They took the lead in meliorating the condition of prisoners and lunatics. They have been earnest and consistent opponents of negro slavery. They have had the courage to do that which other people have not yet begun to think of—disused personal titles.

Stuke.—A mere crotchet; as much a piece of pride as anything else—the pride of being singular.

Gil.—That is scarcely charitable. We must not, you know, employ sweeping condemnations. But be this as it may, the circumstance of a respectable body of men disclaiming the use of any appellation beyond their own proper names, is curious and suggestive. I believe it is the first time that such a thing has been carried out permanently since the beginning of the world; it could only, I apprehend, take place among a people of reflection and deep moral qualities. Among a rude or impassioned people, it might be attempted, but not successfully. The French, in their revolutionary paroxysm, threw down titles; but, morally unprepared for such a step, they took them up again; and everybody knows that titles, and orders, and bits of ribbon, are now to them almost necessaries of existence.

Stuke.—You speak as if titles were worthless—things not to be respected.

Gil.—I speak of them as they are likely to be spoken of in a century hence; very silly additions to our ordinary names—as useless as would be the wearing of gold lace on the clothes, in order to dazzle children. The worth of a man should not be estimated by a title, a feather, or a piece of lace.

Stuke.—True; but do not forget that what all view with respect and admiration is worthy of being supported, however valueless in the abstract. Titles, therefore, as I apprehend, serve a useful purpose in society; and if so, why abandon them?

Gil.—But I anticipate more enlarged and correct views.

Stuke.—A dream! The love of title seems to be inherent in mankind; and so far from cooling down, it is increasing in fervour. The Americans, a professedly go-a-head nation, seem to be fond of titles, although they have neither a king nor an aristocracy. Great crowds of them, on visiting England, hunt up family coats of arms, crests, and mottos, at the herald's college. As politicians, they may pretend to lay aside things of this sort; but as men, they cling to them. Next, look at the mass of our own people. In my young days, workmen took nothing but their own plain names; now, they generally give each other the title of *Mister*. The title of *Esquire* is now becoming so common, percolating so fast down through the mass of the middle classes, that I imagine it will soon reach the manual operatives. According to your notion, this is advancing backwards.

Gil.—I account for it in this way. The working-classes observe others employing titles, and they see no reason why they should not employ them also. In one sense, the adoption of the practice by them arises from a commendable motive—a wish to rise and be respected. But let society advance to the point already attained by the Friends, let the higher classes quietly relinquish, or cease to care for titles, let us hear gentlemen speaking of each other respectfully by their Christian or surnames, and then the operative classes, having no factitious example before their eyes, will abandon what, as far as their respectability was concerned, it was quite unnecessary for them to assume.

Stuke.—'Let the higher classes relinquish titles, and so will the lower.' That is your proposition. But I dispute that they will ever come to this point. The thing is an entire supposition on your part, unwarranted by facts. We see no evidence of any class being likely to relinquish titles—we in truth see the reverse. We see a growing love of titles everywhere, and yet society is said to be advancing. I cannot understand how you are to reconcile these inconsistencies.

Gil.—I think I observe symptoms of a growing disregard of titles among the more reflecting portion of society; and were the higher classes better educated, which they will be by and by, we should see this disregard much more extensively manifested. I have no doubt, in my own mind, that the day is not far distant when members of the aristocracy will pray to be relieved of titles and privileges which not only injure their usefulness, but mar their fortunes. Without them, however, there will be a progress towards greater simplicity of address, as there has already been towards simplicity of attire. If any man a hundred years ago had said that, in a century hence, gentlemen would not wear powdered wigs, queues, laced coats, swords, and buckles, he would perhaps have been set down as the kind of visionary which you are pleased to think I am. Yet the whole has come to pass. On the same principle of advancement, why may we not predict the finish of name-ornaments—titles? There may be a silly craze at present for adopting *Esquire*, but I overlook that in the many greater symptoms of a contrary tendency.

Stuke.—Still, I do not readily abandon the idea of titular honours. As rewards for important public services, they are matters of some consequence in our social policy.

Gil.—Unfortunately, they are as indefensible on this score as on any other. It has been too long the practice to hold out rewards of various kinds for meritorious actions; so long, that disinterested services of any kind are considered Quixotic, and are, in fact, not believed in. Society is so much accustomed to think that everything is, or ought to be, done for a selfish purpose, that faith in purity of sentiment is become one of the rarest virtues. I cannot but think this a hardship. When a man performs a benevolent or heroic action for the pleasure it is calculated to impart, or because it is his duty to do so, he cannot but feel hurt that his motives are misinterpreted, that every one imputes to him the hope of some paltry reward.

Stuke.—I cannot exactly see what all that has to do with the spontaneous distribution of honours?

Gil.—Only that the distribution, as you call it, establishes a sort of coin in payment of what it was quite unnecessary to pay. Then what mischief is not done by the capriciousness of the distribution—what vanities are pampered, what mortifications are created! There is as little principle in the bestowing of honours as in the erecting of public monuments. With some few exceptions, the rule in England seems to consist in giving honours only to soldiers. By a false mode of speech, it is inferred that no one *serves* his country except by fighting in its cause. The educator, the lawyer, the philosopher, the divine, the man of letters, the merchant—none of these serves his country, or is worthy of so much as thanks for a whole lifetime of usefulness. The only man considered deserving of public approbation, honours, rewards, is the fighter. The world yells in acclamation of a well-fought field, and courts hasten to load its hero with favours. In France, there is a little more liberality in this respect: honours are there distributed in nauseous profusion, to meet the national appetite, and often with little regard to decency. I observe by the newspapers that the king of the French the other day graciously entertained at his table a butcher, who had made a present of a fat ox, to walk in a religious procession in Paris—a cheap way of getting admitted to court. Ridiculous as this is, it is not more so than the origin of many titles in England. Sir Richard Arkwright was not knighted for his valuable inventions in machinery, which one could have understood, but for presenting a corporation address to the reigning monarch—a mere piece of ceremony. Such things cast a species of odium over titles. Like our public monuments, they teach no truth, promote no virtue. The Friends are quite right in having nothing to do with them.

Stuke.—Back again to the Quakers! Among your commendations of these personages, I wonder you do not mention their odd sort of dress?

Gil.—Because I do not think it deserves commendation; yet it is not unworthy of notice, if only for the purpose of showing how men with generally clear understandings may sometimes fall into petty errors. I do not know why the Friends have chosen to adhere so closely to a garb prevalent in the seventeenth century in England. I should think it is not from religious principle; certainly not from any attachment to old costumes. The dress is more probably worn for the sake of distinction, and in disregard, perhaps contempt, of current changes of fashion. From whatever cause, the usage is anything but philosophical. A principle, to be sound, must be susceptible of being carried out consistently in all ages, and in all climes and countries. What is right in principle in England, must be right in principle in Timbuctoo, where the garments we are talking of would assuredly never answer. Thus we see that fixedness in dress is a ridiculous notion. Costume must always less or more depend on degrees of latitude, and should be left to alter according as new lights break in upon mankind. A person may dress in the fashion of the day without being chargeable with vanity. I rather think that the best way of showing that dress occupies no part of our thoughts, is to adopt exactly that form of attire which happens to prevail: leave the whole affair to the tailor, as unworthy of serious consideration. I am sorry that the Friends have not viewed the matter in this light. They have made themselves singular for no good purpose that I can see; and the sooner they glide—as I perceive some of them are already beginning to do—into the ordinary stream of society, as regards such trifles, the better.

VISIT TO THE CROCODILE CAVES.*

On a fine sunny morning, with a light wind, my boat floated quietly down the Nile, its broad waters reflecting village after village, and grove after grove of date-trees. Long lines of pelicans edged the sand-banks: they did not move for us. I mused on the same, with my constant friend by my side—my pipe: all was tranquillity. I could but lament that, in a few short weeks, I must bid adieu to a country which had so much interested me; and with deep regret I contemplated the time when, in sketches and recollections, I must try and conjure up the magic scenes by which I had been so many months surrounded. I had revelled in temples (pardon the expression), I had lived in tombs, I had boiled my tea-kettle with mummies' bones, descended into labyrinths of passages—poking up from their long-hidden places birds and beasts; in short, I had become artist, naturalist, and half-Arab. I had ridden a camel, and I had shot at—but never *killed*—a crocodile. Here my train of musing was at once cut short by the remembrance that I had never been in the crocodile pits—so graphically described to me by my French companions at Thebes. True, they said it was a dangerous undertaking—that few accomplished it; nay, they had a story of some traveller having either lost himself, or some of his people: but what of that? If one never attempts a difficulty, he can never experience the pleasure of overcoming one. So with this reflection I filled my pipe, took up my map, just to see whereabouts the place might be; and to my no small pleasure discovered that by to-morrow morning we should arrive at the spot—*Manfalout* . . . . bene—my mind was made up. The rest of the day I teased the Arabs with questions and cross-questions, to see if I could procure any information; and in the evening, when joined by my fellow-travellers—Mr G., an English gentleman, with an abundant stock of good-nature, and my French friend, Monsieur D., with a violin—it was settled to make a party.

About five in the morning we awoke by the keel grating on the sand, and the lullaby of the Arab sailors ceasing with their rowing. They make a rascally noise, but travellers praise it—like Tasso's songs by the gondoliers in Venice. I've heard them both, and when I've not been in a *very* poetical mood, wished both the Arab sailors and Venetian gondoliers at . . . . I wont say where. Alleck was despatched to the town to inquire for a guide, and procure eggs. We commenced washing—that is to say, myself and my English friend; but Monsieur D. forestalled his morning's labours by a tune on that diabolical fiddle. It was found broken one day, and right glad was I of it—it put an end to the *music* for a time. In half an hour, just as the sun began to peep over the sand-hills of the desert, as if 'twas a novelty to him, our breakfast was announced—boiled rice, dates, figs, coffee, eggs, and new bread—and we did justice to it. Shortly after, our guides made their appearance, and informed us that the pits were on the other side of the river, at Amabdi. This was soon obviated. We cast loose, and got into the stream, and a few minutes took us to the other side, where we found the boat of an English gentleman, who was returning from India, but, by an injury to his arm, from a fall from his camel at Thebes, had been an invalid—had put himself under an Arab doctor, been cupped with a cow-horn, and martyred with certain little insects which make the acquaintance of strangers with great pertinacity. He was a

* This sketch is slightly altered from the Art-Union of March, in which it appears, with illustrations from the pencil of its lamented author—the late William Muller. 'It is,' says the editor of that elegant journal, 'a graphic description of a most extraordinary scene; and a striking record of one of the many perils the accomplished writer underwent in his search after knowledge. It was written by Mr Muller for the Art-Union many months ago; he had previously furnished us with the sketches, which we immediately engraved. We were, however, for some time under the impression that the descriptive matter had not been prepared; fortunately, it was found entire, and ready for the printer, among his papers, and was kindly transmitted to us by his brother.'

gentleman of considerable information, and fond of pursuits of a much higher nature than ordinary travellers. In geology and botany he had made considerable advance; and many pleasant evenings I had spent with him in Upper Egypt, generally gaining much valuable information. Our meeting was a pleasure; and, on his hearing our intention of visiting the crocodile pits, he requested permission to join our party: of course we were most happy.

The guides informed us it was necessary to take arms, as in the desert there were some very bad men; and soon the inhabitants of Amabdi saw us loading guns, flourishing sabres, &c. But now came the most difficult part—as to the reward of our swarthy servitors. After much banter, noise, and gesture, we agreed to give them thirty piastres; so, forming a line of march, our party advanced, consisting of about fifteen persons, with guides, boatmen, ourselves, &c. Our way lay along the plain, through beautiful clover-fields, the fragrance of which was most grateful; its luxuriant growth astonishing. Half an hour brought us to the margin of the desert; and it is curious to see what a positive line vegetation makes with the sand: just as far as the waters rise during the inundation, you have rich fertility; but past that, eternal sand.

Our path lay by a ruined convent, long deserted; and then we began to ascend the hills, which are here of considerable height—some thousand feet. We found abundance of shells in the rocks: the echinus was common. We kept on loading our guides, and should have had a very pretty museum, if the cunning rascals had not kept throwing away in nearly the same proportion as we gave them. Having crossed the hills, we came once more into the sandy plain, bounded by hills in the distance—the peculiar character of most deserts. Our guides now pointed to a small spot in the wide expanse; this was the mouth of the pit, and the object of our search. On arriving at it, I found a perpendicular hole, or shaft, of perhaps fifteen or eighteen feet, partly covered by a large block of stone, and the entrance surrounded by numbers of fragments of crocodiles, as also a great number of small pebbles, which that animal at times swallows—I believe to assist digestion. Amongst these, I was informed by a Jew at Cairo, they sometimes find stones of value, that must have been washed from the mountains of Abyssinia, and carried down by the Nile.

Our party made a halt, our guides threw off their clothes, and, with the assistance of the sash worn round the waist, I descended, and was followed by a guide. On arriving, however, at the bottom, I could not discover, at the first instant, where in the name of fortune our direction would be; but as the eye became accustomed to the change of light, I observed a small hole, just large enough to admit a person to enter by lying flat on his chest. The place had a disagreeable smell, different from any mummy-pit I remember; and what did not enhance its general appearance, was a number of large black insects crawling about. The Arab lit some wax candles, motioned to me, and at once placing himself flat on the ground, extending his arm with the candle, commenced to enter this mysterious abode of silence. I followed, and then there was room for the rest of my friends to come down. Mr N. declined the attempt, as his arm was far from well. We proceeded; the passages being tortuous, and the bats most numerous, insomuch that at times we feared they would extinguish the lights. We soon, however, arrived at a small chamber, when we left off practising our lizard-like exercise, and began to look at one another, and to rest for a second; but *en avant*. We now changed our previous order: my stout friend G. went before: the passage became narrower, insomuch that more than one or two bats that were hanging to the roof came to an untimely end by being squeezed to death by the backs of the foremost of our party; and poor G., who was much the stoutest of our 'set,' in one place stuck fast and firm. My laugh was unavoidable; but it sounded strange to the ear, as it echoed through the long passage. By dint of much exertion he got free; and once more we came to a chamber of rather large dimensions, the roof ornamented with hieroglyphics. Several small holes surrounded it: our guides fixed on one, and again we continued our route. The heat was tremendous; and it was with no small pleasure we found ourselves in a vast cavern, the roof of which I could not well see with our small means of lighting it. We sat down on some large blocks of stone, and began to take breath, for our exertions had been great. The guides, who looked like two fiends from the infernal regions, began to undo a piece of wood (made from the fibre of the date); this they tied to a large stone, then commenced searching about for the entrance to the next passage. All this caused a suspicion on my mind, and I determined to mark the passages as we entered and as we left them. I think, in the sequel, I, as well as my companions, had much reason to be thankful for this precaution.

We went once more creeping, the last Arab taking in his hand the cord, and came to chamber No. 4. Here large blocks of stone formed the ground, until a chasm, the depth of which I know not, presented itself. We summoned our courage and our strength to jump it, and all gained the other side: it was a place, to use the words of a favourite author of mine (Forsyth), 'that *curiosity* might stand appalled to gaze within.' We entered another passage which led us to the largest chamber we had yet been in. Here it was discovered that the cord had broken—the thread to our labyrinth gone! The two guides began now looking about for the next passage, but in vain: amongst the many, they could not determine. They entered some, and then came out again: we heard them shouting to one another, as the voices of some demons, but all to no purpose. We sat with patience; we had been under ground an hour, or very nearly so; our candles began to burn short; and our patience, much like our candles, could not continue for ever. The *guides* began crying, beating themselves, and performing a very pretty farce; but it would not get us on, and we made them signs to return; but in this we were as unfortunate. Passages on all sides of the chamber, they knew not which to take; and now came the full horrors of our situation before us. We might have strayed so far from the right path, that, in case of our friend and servants seeking us—and they had no guide—they might not find us. Where and to what may not these passages lead? How far may they continue? And to what extent? These were questions which forced themselves upon our minds. Our candles went on burning, and, much like time to the ill-fated man about to be executed, each moment shortens both. Truly our consternation was great—to be buried alive in such a place!—without light, without assistance, without the means of making ourselves heard. We gazed on one another, and the full truth of our situation seemed to occupy our minds past the power of utterance. This, then, might be the termination of all our travels, of all our hopes. In vain had our pretended guides sought the path by which we entered; they sat down, and for a moment all was silence. That black gulf over which we jumped presented fresh horrors; the little narrow winding thread-like passages, all came before the eye, and the picture was despair. No word spoken—silence, deep and profound, alone seemed to occupy this abyss: the moments seemed hours. Still the candles burned: the knowledge of this roused us. We for the first time, in a low voice, began to communicate our ideas one to the other: the voice now sounded like some discordant noise. How different from when we entered!—the laugh, the jest; then all was mirth, now all gloom.

We knew well that those who were without—our servants and friend—might never have it in their power to assist us; the former from superstition and fear (the loss of poor Legh's guides in this place must be fresh on their minds); and the latter (Mr N.) could have little power to cause us to be sought. We had tried all in our power to discover the passage; we talked over all the probabilities of finding it. In vain I had sought my piece of paper. All was despondency: the ideas of a lingering death—famine in its worst form—haunted the brain, and filled it with terrible forebodings. The candles were becoming shorter and shorter: the truth of this seemed to flash upon my mind more than on my companions, and at once I determined to act. That determination I believe saved us. How absurd to waste that on which our only power of escape existed—the means of light! I immediately proposed the putting out all but one, dividing the few matches we had between two of our party, and then commencing a search for the paper with the utmost attention, as that was our only clue. We left our French friend sitting alone; not but that he was a man of courage and considerable thought. I could not help at the instant expressing a wish that he had had his '*violin pour passé le temp*;' he gave me such a look. But I dislike melancholy as much as I did my situation; and if the worst came to the worst, our entertainment promised nothing better than eating our lean, dry, brown Arabs up—and that was not exactly the thing one would like. These reflections came into my head as I

was poking it into one hole after the other: and how I regretted the wax that kept on falling drop after drop; how we may want it in this infernal petrified region!

We had gone on nearly round the chamber, when all seemed hopeless. There remained but one or two holes more. A shout of joy broke from us both: there was the paper! But was it possible we had entered by that little hole? It must be so. It was truly so small, that we had overlooked it in our former search, and not regarded it as we crawled into the cavern. Huzza! Poke up those black devils, and come along, my boy! In our joy, the Arabs were more frightened than before: they must have thought it was our song previous to a cannibal feast. But how the rascals showed their teeth when they saw us light the candles, and begin the crawling exercise! With our passage out I will not inflict the reader: he must be as tired as we were, especially as he has to descend again. We gained the fresh air, all perspiration and sand: we congratulated one another, had a good draught of water, lit our pipes, and instructed our servant, in particular set terms, to abuse the pretended guides. They looked rather queer when they found we did not intend paying them. But we had not seen the crocodiles.

We were regretting this, when on a sudden we saw an old man with a long beard coming across the desert: he was of a most venerable appearance. All shouted out, *this is the true guide:* this is..... I forgot his name. He laughed with a sort of inward satisfaction when he heard our story, and told us he expected it. He had heard of our departure, and, with anticipation of its proving unsuccessful, came after us, had brought some candles, &c.: this was civil. I liked the look of the old gentleman. I had faith in him; indeed so we all had, and we disliked being foiled in anything we attempted. We made certain we should go down again; and so we did; but we took with us our interpreter, followed a different route, and did not pass the chasm or the large hall. He showed us his marks on the sides of the rock, scratched into the stalagmite, which was of a beautiful brown colour. Could the exhalations of the bitumen have mixed with it? He gave us particular caution as we began to enter one passage, to mind and not let the candle fall on the inflammable substances by which the ground was covered—date leaves and old pieces of rag.

On proceeding a little farther, judge of our surprise: we were literally crawling over the bodies of once living human beings—mummies! Were these the *red-haired*—sacrificed to the crocodile, as some authors assert? The head I brought out with me, and afterwards sent to Bombay, had *red hair*—the learned must decide. There was something a little novel in this. We continued thirty or forty yards, when the old man stopped, turned round and pointed, then touched himself, and then something on the ground. This was the body of a man; just behind him another. These were the remains of Legh's guides: they died from the mephitic vapour, he narrowly escaping. One was better preserved than the other: it was in a bent-up position, dried with all the flesh on, and a part of the blue dress still left. I lifted it. It may have weighed ten or fifteen pounds.

We now entered the chamber of crocodiles, the object of all our pursuit and adventure. There they lay, of all sizes, from five inches to twelve feet, and I daresay more: thousands packed on thousands, and so packed for thousands of years. I soon obtained a fine large head, and some half-dozen small crocodiles, all bandaged in cloth. There was little to observe in this sanctum sanctorum, and no knowledge how far it continued: it evidently had not been much visited. At the end of the passage, which might have been twelve or fifteen feet high, the bodies formed a solid mass. It was from the sides I obtained the specimens.

Our return, however, was rather ludicrous: one of the Arabs stuck the head on a spear, and looked a little like David of old. I chalked, or rather printed, the line of Dante over the entrance—

'Lasciati agnè speranza voi che entrate.'

We gained our boats at a late hour in the evening, enjoyed boiled rice and fruit; and just as we were commencing to light our pipes, the fiddle struck upon my ear, with 'Dunois the brave.' I wished him at a place in the country he was bound to—Jericho.

One by one the stars shone out, the sky became of a deep purple, then to an indigo, the moon was high in the heavens, the plumed date-trees slept in her silver light, the slender minarets of Manfalout painted into the clear vault of the sky. All was repose. My friend's music had long ceased. All was silence. 'How beautiful is night!' At least so I thought. My mind, nevertheless, turned to friends. I had few to trouble my mind about at that time; and then to HOME—that was more easily disposed of, for I had no particular spot in the world so called. After these and various other subjects, but all in vain, I hit upon the right one—*sleep*. But my kind-hearted musical friend was of a different opinion. He opened a box, took out a little miniature, and then I heard a sort of smacking noise. Ay, ay, my fine fellow; my head to a handful of split peas you wont do that ten years hence. I pulled my beurnouse tighter over my face. What he did next I could not see; but in the middle of the night I awoke with the idea that the boat was on fire: it was only Monsieur writing a long letter, by camp-light, *to* ..... no matter whom. Good-night, again, M. B.; and once more to sleep, with hopes of an early breakfast.

PROFESSOR FARADAY'S FURTHER RESEARCHES IN MAGNETISM.

IN No. 114 of the present series of the Journal, we gave a brief report of Mr Faraday's lecture on the relation of light and magnetism. Since its delivery, he has explained away a misapprehension existing in the minds of many persons as to his experiments, which it was imagined were meant to prove that the luminousness of a ray of light is due to magnetism. The truth, however, resolves itself simply into this: that, regardless of any of the existing theories on the nature of light, whatever is magnetic in a ray only has been affected; the line of magnetic force was illuminated by the ray of light used in the experiment, as the earth is illuminated by the sun: there was no creation of light; the ray was required to show that light, in common with ponderable matter, is acted on by magnetism.

A second lecture was delivered by Mr Faraday, at the beginning of March, 'On new magnetic actions, and on the magnetic condition of all matter.' So great was the interest excited by the announcement of the subject, that the entrance-hall of the institution was thronged, long before the hour of admission, by a dense body of individuals from among the most scientific class, who afterwards filled the theatre to overflowing, many being unable to obtain seats. It was impossible to look round on the intellectual-looking assembly, without being struck with the reflection that they had met to do homage to some of the highest truths of science.

Punctual to the hour, the lecturer made his appearance, and observing that he would not waste time in idle regrets that a portion of the audience was unable to find accommodation, proceeded to the discussion of the subject. The apparatus used on this occasion was the same as at the former lecture, with a little difference of arrangement. The helix stood perpendicularly on the floor, connected as before by wires with the electro-galvanic battery; and the large horse-shoe magnet was placed so that two poles only were seen rising through openings to a level with the surface of the table in front of the operator, who, by this arrangement, had the great power of the apparatus completely under command, while it afforded the best means of exhibiting the effects. A few experiments were made to display the energy of the magnetic force, with less than which, the lecturer observed, it would be in vain to look for the phenomena. He succeeded in showing, with a quantity of iron nails, the line of force passing from one pole of the magnet to the other; along this curve they were seen clinging to each other, and describing a regular arch several inches in length and height; which position they retained until, on breaking communication with the battery, they instantly fell in a confused heap to the table.

Mr Faraday next adverted to the popular ideas of magnetism with regard to iron and some other metals, which point freely north and south, and explained the importance of showing the relation of the power he employed to common magnetism. A small bar of iron was suspended by a thread to move freely in the line of force between the poles, and, on charging the magnet, the bar was seen to obey the natural law by pointing north and south, in a line from one pole to the other, or what the lecturer terms the *axial* line. This simple experiment was necessary to enable the audience to understand the allusions to the axial line in the subsequent portion of the lecture. Among the metals, nickel, cobalt, platinum, palladium, titanium, and a few others possessed of the same property, are classed as magnetics.

The power here afforded for testing the magnetism of all substances, was noticed and exemplified by suspending, in the place of the iron, a small bar of copper, which was found to be neither attracted nor repelled, remaining, with the exception of some very feeble manifestations, indifferent to either position. A piece of paper was also tried, and, after some vibrations, proved to be magnetic, by remaining stationary in the axial line.

Mr Faraday then recalled to the memory of his hearers the experiment in his former lecture, showing the peculiar action of glass on light. On that occasion the piece of glass, through which the magnetism found its way as readily as though no substance intervened, was named a diamagnetic; and it was to the testing of this peculiar property that the subsequent experiments were directed. To insure a satisfactory result, more than ordinary care and delicacy were required in the manipulation. Threads of cocoon silk, free from torsion, were used as the suspending medium, bearing at their lower extremity a small stirrup of non-magnetic paper, in which was laid the substance forming the subject of the experiment, and the whole was hung inside a glass chamber, to protect it from currents of air. On placing a small bar of the heavy glass in the stirrup, instead of pointing north and south, it took up a directly contrary direction, east and west, or what the lecturer termed the equatorial, in contradistinction to the axial line; describing it further as 'a tendency of the particles to move outwards, or into the position of weakest magnetic action,' the whole of the particles being jointly exercised in producing the effect.

Of all the metals, bismuth is found to be the most energetic diamagnetic; and to show that such substances are repelled by either pole of the magnet, a long glass tube, balanced horizontally, was charged with a piece of the metal, at the end within the line of force; at the other end a piece of coloured paper was fixed, which, by the sweeping arcs it described, demonstrated the repelling power of the two poles as the piece of bismuth was alternately brought within their influence. Sufficient care was taken to show that this is not an accidental, but a constant result in the numerous substances which have been put to the test of experiment, among which were phosphorus and water: the latter, constituting nine-tenths of nature, may play a most important part in her operations as a diamagnetic. All natural substances are affected one way or the other, either magnetically or diamagnetically. A slice of apple cut with a silver knife, a piece of wood, beef, bread, and a thousand other objects—a man, even could he be suspended with the requisite delicacy—all would point east and west, or in the equatorial line. They are all acted on by magnetism, though not magnetic, as iron.

Some curious facts come out with regard to gases, which appear to fill a place, as yet unoccupied by any other substance, between the magnetics and diamagnetics. Whether dense or rare, the phenomena produced are the same; from which it has been inferred 'that air must have a great and perhaps an active part to play in the physical and terrestrial arrangement of magnetic forces.'

Mr Faraday considers air to be a zero point, from which the magnetics and diamagnetics start on an ascending and descending scale; the former rising through various substances and metals to iron, the latter sinking through gold, water, flint, glass, &c. to bismuth, as the most sensitive of the diamagnetics. It is a curious fact, however, that a tube of air, though perfectly neutral when suspended in the magnetic field, in a natural or artificial atmosphere, betokening, as it were, a normal condition, yet on plunging the tube into water, alcohol, or turpentine, it immediately becomes magnetic, and moves into the axial line. It is the same with a vacuum, carbonic acid gas, hydrogen, sulphurous acid gas, and vapour of ether: all point axially when surrounded by water, but equatorially when in air or carbonic acid gas. It is interesting to learn that all the compounds of the magnetic metals are affected in the same way as the metals themselves: 'even the solutions of the ferruginous salts, whether in water or alcohol, were magnetic. A tube, filled with a clear solution of proto- or per-sulphate of iron, was attached by the poles, and pointed very well between them in the axial direction. These solutions supply a very important means of advancing magnetical investigation; for they present us with the power of making a magnet which is at the same time liquid, transparent, and, within certain limits, adjustible to any degree of strength.' It is also obvious that here we have the opportunity of looking into a magnet, and noting the results of different portions of magnetic matter placed one within the other.

Heated iron, which is insensible to the action of an ordinary magnet, is affected by the electro-magnet, and points, though but feebly, in the axial line; but on cooling, it soon regains its active magnetic properties, and leaps to the pole by which it is attracted. This experiment will tend to throw a further light on the question of the magnetism of heated metals.

Some experiments were next introduced to show that the results are frequently modified by surrounding circumstances, rendering caution necessary in the deduction of conclusions. Chromate of lead, on being subjected to the magnet, took up the equatorial position; but crystals of the bichromate showed themselves slightly magnetic. And again, a solution of the latter pointed equatorially; but, on the addition of a little alcohol, resumed the axial position. The lecturer illustrated this fact still further by bringing forward a glass jar, the lower half of which contained a solution of sulphate of iron, the upper half water. This was placed between the poles of the magnet, and the tube of air suspended in the fluid: in the water the tube pointed as before, north and south; but when lowered into the solution, it became a diamagnetic, and pointed east and west. In connexion with these apparent anomalies, it may also be noticed, that although blood and flesh, beef and mutton, contain iron, yet they are not magnetics.

The general sum of the experiments may be best given in a quotation from Mr Faraday's published observations on the subject:—

'Having arrived at this point, I may observe, that we can now have no difficulty in admitting that the phenomena abundantly establish the existence of a magnetic property in matter, new to our knowledge. . . . All the phenomena resolve themselves into this, that a portion of such matter, when under magnetic action, tends to move from stronger to weaker places or points of force. . . . This condition and effect is new, not *only* as it respects the exertion of power by a magnet over bodies previously supposed to be indifferent to its influence, but is *new* as a magnetic action, presenting us with a second mode in which the magnetic power can exert its influence. . . . All matter appears to be subject to the magnetic force as universally as it is to the gravitating, "arranging itself" into two great divisions—the magnetic, and that which I have called the diamagnetic class; and between these classes the contrast is so great and direct, though varying in degree, that where a substance from the one class will be attracted, a body from the other will be repelled.'

Mr Faraday considers that the uses of this power will eventually be developed. 'It cannot for a moment be supposed that, being given to natural bodies, it is either superfluous, or insufficient, or unnecessary. It doubtless has its appointed office, and that one which relates to the whole mass of the globe; and it is probably because of its relation to the whole earth, that its amount is necessarily so small, so to speak, in the portions of matter which we handle and subject to experiment. . . . Matter cannot thus be affected by the magnetic forces, without being itself concerned in the phenomenon, and exerting in turn a due amount of influence upon the magnetic force. . . . When we consider the magnetic condition of the earth as a whole, without reference to its possible relation to the sun, and reflect upon the enormous amount of diamagnetic matters which, to our knowledge, forms its crust; and when we remember that magnetic curves of a certain amount of force, and universal in their presence, are passing through these matters, and keeping them constantly in that state of tension, and therefore of action, which I hope successfully to have developed, we cannot doubt but that some great purpose of utility to the system, and to us its inhabitants, is thereby fulfilled, which now we shall have the pleasure of searching out. . . . If one might speculate upon the effect of the whole system of curves upon very large masses, and these masses were in plates or rings, then they would, according to analogy with the magnetic field, place themselves equatorially. If Saturn were a magnet, as the earth is, and his ring composed of diamagnetic substances, the tendency of the magnetic forces would be to place it in the position which it actually has.

'It is a curious sight to see a piece of wood, or of beef, or an apple, or a bottle of water, repelled by a magnet; or taking the leaf of a tree, and hanging it up between the poles, to observe it take an equatorial position. Whether any similar effects occur in nature among the myriads of

forms which, upon all parts of its surface, are surrounded by air, and are subject to the action of lines of magnetic force, is a question which can only be answered by future observation.'

The lecture, which occupied nearly two hours in the delivery, was listened to throughout with undivided attention by the auditory, who, at the close, manifested their pleasure in loud and enthusiastic plaudits. We cannot conclude our notice better than in Professor Faraday's own words:—'It will be better to occupy both time and thought, aided by experiment, in the investigation and development of real truth, than to use them in the invention of suppositions which may or may not be founded on, or consistent with, fact.'

THE WORLD IS NOT SO BAD AS IT IS BELIEVED TO BE.

[From a pleasant little volume, entitled *Literary Florets*, by Dr Thomas Cromwell, consisting of short pieces in prose and in verse —'the products,' according to the author, 'of moments calling for no more important employment.' London: J. Chapman. 1846.]

I VENTURED this observation to my companion over an excellent breakfast in the travellers' room at the Crown Inn, Devizes. He was a veritable 'traveller,' arrived late the night before; but I had been such by courtesy only, while making this inn my head-quarters for some preceding days, devoted to antiquarian researches in the neighbourhood. 'No,' said I, in answer to a remark which I thought too depreciatory of men in general, 'the world, in *my* opinion, is *not* so bad as it is believed to be.'

'The world,' replied my new acquaintance, '*I* think a very wicked world. It shows its wickedness by its suspicion. It trusts nobody: and why? Because it knows it is not worthy to be trusted. And so, as I expect it will place no confidence in *me*, I place no confidence in *it*. "Trust no man any further than you can see him:" that's my maxim.'

I was provoked by this to relate a little 'incident of travel,' which, occurring to myself not above a week before, had proved, to my own satisfaction at any rate, that the world *will* sometimes trust those whom it does not know. I had reached Salisbury after dark, and all the shops were closed. Notwithstanding, I presumed to knock at a bookseller's opposite my inn, and beg to be allowed to purchase a 'guide' to Old Sarum and Stonehenge, as it was my wish to employ an hour or two in recruiting my knowledge (then wholly derived from reading) of those interesting antiquities, the better to enjoy a personal inspection of them the next morning. The worthy tradesman was 'out of the guide,' but would with pleasure *lend* me a book—a portly volume, and with plates, which, he assured me, contained all the information I required. Surprised, I stated that I was only at the—naming where the coach had set me down—for a night, and should quit in all probability soon after daybreak. 'That,' he said, 'need make no difference; you can leave it for me at the inn.' Even my desire to make a proper compensation for the loan was not acceded to, on the delicate ground that, as the books did not 'circulate,' he, the bookseller, was ignorant of the proper charge. As I told my story, methought the traveller's eyes opened wider; and when I had done, he was so rude as to give the lowest possible whistle. But, apologising, 'I'll believe *you*,' he said; 'though it's the strangest way of turning stock I ever heard of. Not very likely to make fifty per cent. of his money. Well, people are not always awake. But I say still, "Trust no man any further than you can see him."' Long before our conversation had proceeded thus far, we had, I should think, equally arrived at the opinion, that two persons could hardly be more unlike each other, in their whole turn of mind and pursuits, than were my companion and myself: he entirely devoted to business, and I the rather given to literature; he a keen man of the world, and I—an antiquary. But, nevertheless, we got on surprisingly well together; and our discourse, I am persuaded, gave a zest mutually to our breakfast.

It appeared that we were going the same road; though he only as far as Reading, and I through that town to London. Having settled with the 'house,' therefore, we took up a position in front of the 'Crown,' to be ready to mount the first coach from Bath. In those days stage-coaches were in their glory; and several, whose destination was the metropolis, changed horses at Devizes daily. But, for a reason which I forget, coach after coach came up, and not a place, outside or in, could be obtained. My friend bore the arrival and departure of the fully-loaded vehicles with true traveller-like equanimity; but my—yes, I confess it—my ill-humour grew with every disappointment; and when the last day-coach was gone, and we were left without another chance until the evening, I had so little of the traveller's heart remaining in me, as to turn a deaf ear to the suggestion of my brother in misfortune—that the best way to fill up the time would be by 'dinner and a bottle.' To tell the exact truth, I employed the intervening hours in a spiritless inspection of some relics of early Norman architecture possessed by the oldest church in the place, taking a solitary snack at a small road-side inn, in preference to a good meal with fair companionship at the 'Crown.' My conscience smote me for this, when, on returning, I saw my friend already at his post, on the spot we had so fruitlessly occupied in the morning. I thought too that his greeting was not quite cordial. But almost immediately the evening coach drove up; it had room for both outside; and as we sat together, I took an opportunity to say that vexation at the imagined possibility of being kept another night at Devizes, when it was of great consequence to me to be in London early the next day, had rendered me not 'i' the vein' for good fellowship. The excuse was accepted; and our talk was cheerful until we had passed, as daylight was failing, the great barrow of Silbury, which my restored companion seemed interested to learn was not, as he had always supposed it to be, a rather considerable natural hill. When informed, however, that this same barrow was a work of the ancient Britons, and might boast an antiquity of at least two thousand years, he hoped he should be allowed to 'tell *that* again with some discount.'

But now a new unpleasantness began to be felt by one of us. It was early summer; and, for a brief week's excursion, I had not thought of an equipment adapted to a night-ride through almost frosty air. My friend observed my deficiency; and remarking that, as a traveller, *he* was very differently provided for, proposed to invest me with a most capacious box-coat, which, he said, he could perfectly well spare, having another top-coat and a cloak besides. I demurred to the offer, since I should be only the worse off for having accepted it when he got down at Reading. 'But my coat needn't get down at Reading,' was his reply; 'here's a card of our house in town; you can forward it when you arrive.' The conversation of the morning flashed through my mind, and I hardly repressed an exclamation of astonishment. What! the traveller, the man of business and of the world, confide a coat that must have cost seven or eight pounds, and which, as I had seen in the daytime, was still in excellent condition, to a perfect stranger, to one whose name even he did not know, and as to whose whereabouts 'in town' he made no inquiry! As I donned with thankfulness the comfortable habiliment, having first deposited my card with its owner, I could not avoid repeating, 'Trust no man any further than you can see him.' 'Pooh!' said he; 'safe as the bank at Salisbury.' He shook my hand heartily when he alighted at his destined hostelry; and a nap I soon afterwards obtained in his coat was forwarded, I make no doubt, by my often murmured repetitions of, 'The world *is* not so bad as it is believed to be.'

TAKING A NEWSPAPER.

[*From an American publication.*]

'PLEASANT day this, neighbour Gaskill,' said one farmer to another, coming into the barn of the latter, who was engaged in separating the chaff from the wheat crop by means of a fan.

'Very fine day, friend Alton. Any news?' returned the individual addressed.

'Nothing of importance. I have called over to see if you wouldn't join Carpenter and myself in taking the paper this year. The price is only two dollars.'

'Nothing cheap that you don't want,' returned Gaskill in a positive tone. 'I don't believe in newspapers; I never heard of one doing any good. If an old stray one happens to get into our house, my gals are crazy after it, and nothing can be got out of them until it's read through. They would not be good for a cent if a paper came every week; and, besides, dollars aint picked up in every corn-hill.'

'But think, neighbour Gaskill, how much information your gals would get if they had a fresh newspaper every week, filled with all the latest intelligence. The time they would spend in reading would be nothing to what they would gain.'

'And what would they gain, I wonder? Get their heads filled with nonsensical stories. Look at Sally Black; isn't she a fine specimen of one of your newspaper-reading gals? Not worth to her

father three pumpkin seed. I remember well enough when she was one of the most promising bodies about here. But her father was fool enough to take a newspaper. Any one could see a change in Sally! She began to spruce up and to look smart. First came a bow on her Sunday bonnet, and then gloves to go to meeting. After that she must be sent to school again; and that at the very time when she began to be worth something about home. And now she has got a forty-piano, and a fellow comes every week to teach her music.'

'Then you wont join us, neighbour?' Mr Alton said, avoiding a useless reply to Gaskill.

'Oh no—that I will not. Money thrown away on newspapers is worse than wasted. I never heard of their doing any good. The time spent in reading a newspaper every week would be enough to raise a hundred bushels of potatoes. Your newspaper, in my opinion, is a dear bargain at any price.'

Mr Alton changed the subject, and soon left neighbour Gaskill to his fancies.

About three months afterwards, however, they again met, as they had frequently done during the intermediate time.

'Have you sold your wheat yet?' asked Mr Alton.

'Yes, I sold it day before yesterday.'

'How much did you get for it?'

'Eighty-five.'

'No more? Why, I thought every one knew that the price had advanced to ninety-five cents. To whom did you sell?'

'To Wakeful, the storekeeper in R——. He met me day before yesterday, and asked me if I had sold my crop yet. I said I had not. He then offered to take it at eighty-five cents, the market price; and I said he might as well have it, as there was doubtless little chance of its rising. Yesterday he sent over his wagon, and took it away.'

'This was hardly fair in Wakeful. He came to me also, and offered to buy my crop at eighty-five. But I had just received my newspaper, in which I saw that, in consequence of accounts from Europe of a short crop, grain had gone up. I asked him ninety-five, which, after some haggling, he consented to give.'

'Did he pay you ninety-five cents?' exclaimed Gaskill in surprise and chagrin.

'He certainly did.'

'Too bad!—too bad! No better than downright cheating to take such shameful advantage of a man's ignorance.'

'Certainly Wakeful cannot be justified in his conduct,' replied Mr Alton. 'It is not right for one man to take advantage of another man's ignorance, and get his goods for less than they are worth. But does not any man deserve thus to suffer who remains wholly ignorant in a world where he knows there are always enough ready to avail themselves of his ignorance? Had you been willing to expend two dollars for the use of a newspaper for a whole year, you would have saved, in the single item of your wheat crop alone, fourteen dollars! Just think of that! Mr Wakeful takes the newspapers, and, by watching them closely, is always prepared to make good bargains with some half-dozen others around here who have not wit enough to provide themselves with the only sure avenue of information on all subjects—the newspaper.'

'Have you sold your potatoes?' asked Gaskill with some concern in his voice.

'Oh no—not yet. Wakeful has been making me offers for the last ten days. But, from the prices they are bringing in Philadelphia, I am well satisfied they are worth about thirty cents here.'

'About thirty! Why, I sold to Wakeful for about twenty-six cents!'

'A great dunce you were, if I must speak so plainly. He offered me twenty-nine cents for four hundred bushels; but I declined. And I was right. They are worth thirty to-day, and at that price I am going to sell.'

'Isn't it too bad?' ejaculated the mortified farmer, walking backwards and forwards impatiently. 'There are twenty-five dollars literally sunk into the sea. That Wakeful has cheated me most outrageously.'

'And all because you were too close to take a newspaper. I should call that saving at the spigot, and letting out at the bung-hole, neighbour Gaskill.'

'I should think it was indeed. This very day I'll send off money for a paper; and if any one gets ahead of me again, he'll have to be wide awake I can tell him.'

'Have you heard of Sally Black?' asked Mr Alton after a brief silence.

'No. What of her?'

'She leaves home to-morrow, and goes to R——.

'Indeed! What for?'

'Her father takes the newspaper, you know?'

'Yes.'

'And has given her a good education?'

'So they say; but I could never see that it has done any good for her, except to make her good for nothing.'

'Not quite so bad as that, friend Gaskill. But to proceed: two weeks ago Mr Black saw an advertisement in the paper for a young lady to teach music, and some other branches in the seminary at R——. He showed it to Sally, and she asked him to ride over and see about it. He did so, and then returned for Sally, and went back again. The trustees of the seminary liked her very much, and engaged her at a salary of four hundred dollars a-year. To-morrow she goes to take charge of her classes.'

'You cannot surely be in earnest?' farmer Gaskill said, with a look of profound astonishment.

'It's every word true,' replied Mr Alton. 'And now you will hardly say that a "newspaper is dear at any price," or that the reading of them has spoiled Sally Black?'

Gaskill looked upon the ground for some minutes. Then raising his head, he half-ejaculated with a sigh, 'If I haven't been a confounded fool, I came plaguy near it! But I will be a fool no longer: I'll subscribe for a newspaper to-morrow—see if I don't!'

AFRICAN HAIR-DRESSING.

Some of the tribes of the interior have a particularly troublesome method of plaiting the hair, and which is constantly seen in Benguela. They divide the hair into many thousand little braids, and, considering the peculiar curly nature of the negroes' locks, this must require considerable art, and a good stock of patience. A red, yellow, or blue bead is drawn over the end of each braid; or, which is perhaps more frequent, each plait is covered with as many various-coloured beads as it can possibly hold. When the hair is thus arranged, it hangs down over the shoulders, and makes a noise at the slightest movement; whereas, when there are no beads attached to the braids, they stand off stiffly all around the head, and give it a very ugly appearance. Those who wear their hair in this Medusa-like fashion, invariably place the additional ornament of a beautiful feather on the crown of the head or behind the ears. The most prevalent mode is to shave portions of the head, according to individual fancy, and form the remaining hair into the most ridiculous tufts; some, for instance, shave it quite close, with the exception of a small bunch, which is left on the crown, and which looks exactly like a worsted tassel. This almost appears to be an imitation of the Chinese; but the hair of the negroes is never so long, nor in this case is it ever braided. Other negroes have only a narrow strip of hair running from the forehead to the nape of the neck, and is evidently intended to resemble the mane of a wild beast; and thus the object of acquiring a savage and warlike appearance is unquestionably attained. Others, again, shave one-half of the head—either one side, the back, or the front—leaving the other in its natural state.—*Tams's South-Western Africa.*

DEATH IN LONDON.

The Registrar-General of births, deaths, and marriages, has recently issued his annual tables of the mortality in the metropolis for the year 1845. In the year 1841 there were computed to reside within the city and suburbs 1,915,104, of whom 1,018,091 were females; being in a majority of numbers over men of some hundred thousand. Of these, and such as have been added since, there died in 1845—males, 24,496; females, 23,836; forming a total of 48,332, or, as near as can be computed, about 1 in every 41. No fewer than 14,637 died of diseases of the respiratory organs. The most fatal months in the year were December, January, February, and March—the fewest deaths occurring in June and July. In reference to the comparative healthiness of various localities, the table shows that the low level districts on the south side of the Thames are the least salubrious, whilst the higher grounds, towards the opposite point of the compass, and the flat sandy divisions towards the west, are the most so. Affixed to this useful table is a register of the daily temperature during the year; from which it is seen that, during varying and cold states of the atmosphere, the greatest number of deaths take place.

SLIDING SCALE OF ABUSE.

The emperor abuses his courtiers, and they revenge themselves on their subordinates, who, not finding words sufficiently energetic, raise their hand against those who, in their turn, finding the hand too light, arm themselves with a stick, which, further on, is replaced by the whip. The peasant is beaten by everybody: by his master, when he descends so far to demean himself; by the steward and the *starosta*; by the public authorities; the *stanovoi* or the *ispravnik*; by the first passer by, if he be not a peasant. The poor fellow, on his part, has no means to indemnify himself except on his wife or his horse; and, accordingly, most women in Russia are beaten, and it excites one's pity to see how the horses are used.—*Russia under Nicholas I.*

GOSSIP.

There is a general prejudice against gossip; yet every one more or less indulges in it. Small country towns are made light of in metropolitan ones on account of this propensity; and yet even in the greatest, we hear much conversation which cannot be regarded as anything but gossip. Why is this? How comes it that men have universally the grace to condemn what they have universally the bad taste to give way to? May it not be that there is an error in the condemnation of gossip, not in the indulgence in it? If we could suppose such to be the case, the practice and principles of mankind would on this point be in harmony, excepting only for the anomaly of our condemning what is not entitled to be condemned.

The truth seems to be, that gossip comes in for a great deal of the odium due to its step-sister Scandal, and this in consequence of a confusion in the use of the words. We often speak of a coterie being addicted to scandal, when it is fond merely of gossip; and as frequently that is softened into gossip which in reality is scandal. And doubtless there is some reason for this confusion, seeing that the two things are occasionally seen shading into each other so finely, that hardly anybody could determine where the one begins and the other ends. But things may be blendingly connected, and yet perfectly distinct—as (to take a palpable though not new illustration) the cheek and chin melt into each other, and yet are unmistakeably separate things. When we set ourselves seriously to distinguish between the two entities in question, no difficulty is experienced, and the innocence of Madame Gossip becomes as manifest as does the spitefulness and wickedness of Miss—(yes, for she is an old maid)—Miss Scandal.

Miss Scandal is a very dire old lady, with something like that interest in the morality of a country which the hangman has; that is to say, she has a sensible gratification in seeing errors committed, because, without occasionally having such to comment on, she could not exist. She snuffs a trespass afar off, watches its development with fond anxiety, and would suffer grievous disappointment were it in anyway to go off abortively. It is needless to ask why any one should delight in battening on the faults and follies of other poor mortals: as well inquire why the crocodile and vulture seek their highest enjoyments in putrid animal substances. Enough that there are such beings.

Very different is that good-humoured matron Mrs Gossip. She takes an interest in the affairs of her neighbours, but it is in matters which there is no harm in speaking of. If resident in a country town, she will tell you who is to have a dinner-party to-day, and who are to be at it—what jellies have been ordered at the confectioner's, and which of the two extra servants of the place has been hired in to assist. What mischief, however, is there in this? In a cathedral town, she will give you every particular of the shades of opinion of the various clergy, and how each of them stands affected to the white gown: but is there any harm in merely talking of such things? Again, in a mercantile place, you will hear from the same excellent authority how much certain parties are doing at present in cottons, and what certain other parties are understood to have cleared by their late speculations in railways. But here too her tongue is innocuous. Every kind of place, not excepting London itself, every great profession, every great interest, has its own gossip—gossip being, in short, nothing more or less than the particulars respecting the many private persons, characters, and events which come within the range of observation of particular parties. But in adverting to, and commenting upon, such matters, there may be no harm either meant or done. If there is merely an indulgence in a natural curiosity, or perhaps an unbending of the mind from severer studies—some being gratified, and no one injured—what can reasonably be said against it?

Gossip is sometimes condemned upon what appears at first rather plausible ground; namely, that it is an unwarrantable interference with the affairs of our neighbours. 'Mind your own concerns' is, for sundry reasons, a favourite maxim. Gossip violates it, and gossip is therefore branded as something very bad. All this, however, is a fallacy. It is quite impossible for any person to mind only his own affairs, and take no concern in those of his fellow-creatures. Were it possible, it would be at once absurd and wicked. But it is not possible. And the reason simply is, that we are social beings, and not hermits. If I am put into a world where I cannot pursue a single object, or indulge in a single pleasure, without being more or less brought into connexion with other parties, it appears to me that to say, 'Mind not the affairs of your neighbours,' is like bidding a man be cool whom you have placed at a roasting fire, or telling him to be clothed when he has no clothes, and nothing wherewith to purchase them. If I am to be in the world at all, I must take a concern in everything pertaining to my neighbours: I must know much of their character, their domestic habits, their connexions in life, their means, or I shall not know how to deal with them in any of our unavoidable relations. Either I shall, in ignorance, trust them too much or too little, according as my cautiousness may dictate; and thus, in one way or another, commit an error. It is not merely that I shall be in the dark as to their fidelity in affairs touching pecuniary interests. Some men speak widely, some precisely; some are sanguine, others too despondent. It is necessary to know the character of men in these respects, in order to know how to re-

ceive anything they say—what allowance to make, and what defect to supply. Hundreds of things we do every day, are done with any degree of confidence or accuracy only in consequence of our having previously consulted with this same Madame Gossip, who is at the same time in so much odium and so much request. It will not do to say, 'Inquire into characters and circumstances when occasion arises:' we must have a large stock of such knowledge ever on hand, in order to be able to act with promptitude, or to any good purpose. In fact, in all but extraordinary cases, it is necessary to have the knowledge in a ready-money form, if we would act at all; for, if we had to seek for it, the opportunity would stale, and the door would close. Perhaps, going to seek for it, we should not readily find it. It is therefore necessary, I say, for all men who are to take a part in worldly affairs, to have their ears open to whatever they can readily hear regarding persons and things. Often they will hear what is incorrect; sometimes prejudice will mingle in the tissue; but for this there is no remeed but in hearing much, and testing one man's discourse by another's.

There is even some higher ground on which a concern in the affairs of our neighbours might be advocated. We are to love our neighbours as ourselves; and undoubtedly if we do not feel kindly towards our fellow-creatures generally, and busily seek to benefit at least some of them, and be more concerned for the welfare of a certain *few* than for our own, we cannot be truly happy. But how are we to carry out this beautiful maxim, the deep and eternal basis of all human morality, and that which is yet to make the earth a rose garden, if we are never to listen to a single circumstance respecting these neighbours, never to take a moment's interest in any one of their domestic concerns? It is manifestly impossible. A love, then, to hear of that which touches the weal or wo of our neighbours, abstracted from all tinge of officious and malicious interference, seems to me essentially a good point in human nature, something leading to and assistant of the working out of the great moral apothegm in question, and without which life would be a dreary and sapless waste. Call it gossip, or by any other smile-provoking name you please; but, regarded merely as a certain form or expression of the interest which man feels in man, as his brother in this pilgrimage, I think it not merely a defensible, but, under limitations, an admirable thing.

Have we not here an instance of the feelings giving forth a wiser response than the intellect? Mankind love gossip; this is the language of the feelings. They condemn it; this is the declaration of the intellect. Looking narrowly, we find that the dictum of the feelings is susceptible of a better defence than that of the judgment. Wondrous, wondrous are the ways of the mind in dealing with what surrounds it in this mazy scene!

THE HUMAN SKIN.

The writings of Drs Southwood Smith and Andrew Combe were among the first to direct popular attention in this country to the important uses and functions of the skin. Before the publication of their works, a large proportion of the community regarded the cutaneous coat as a mere covering, intended to keep the fat and muscles of the body in their place, which might be left to take its chance amid the wear and tear of life. The daily ablution, so essential to its healthy action, was seldom if ever thought of: there were thousands who never washed the whole of their bodies from the day they ceased to be infants to that of their death. The most pernicious and absurd notions prevailed respecting the clothing worn next the skin. It was in many instances considered essential that flannel, when once put on, should on no account be taken off again; hence the garment remained unchanged until it dropped piecemeal from the wearer's back, when it was replaced with a new one, only to undergo the same process.

Happily, much of this deplorable ignorance has disappeared before the increasing spread of knowledge and information. In a work now before us,* by a medical writer, the whole question of the cuticular economy is thoroughly investigated. The author explains the nature of the outer and inner skin, the perspiratory system, the oil-glands of the skin, and the influences to which it is exposed from diet, clothing, exercise, and bathing; and the causes and progress of disease. The descriptions are assisted by engravings, which represent, on an enlarged scale, the anatomy and appearance of the membrane.

The interior, as well as the exterior of the body, is covered with a skin: in the former case, from being constantly moist, it is known as *mucous membrane*. The difference between the two, which are connected by the perspiratory tubes, may be seen in the inside and outside of the eyelids, or where the skin of the face passes into the soft red skin of the mouth. The outer skin is composed of two layers: the upper, or that raised by a blister, is the *scarf-skin*, or epidermis; the under layer is the *sensitive-skin*, or dermis. The offices they perform are different. The *scarf-skin*, as may be seen by the finger-nails, is horny and insensible; while the other is possessed of the most acute sensibility, except where dulled by unusual thickness of its covering. The latter is formed by the exudation of a transparent fluid from the blood-vessels, crystallised, so to speak, in innumerable granules, each one endowed with life, on the surface of the sensitive-skin. These granules increase in size by constant accumulations from beneath, and form cells, which gradually become converted into dry flattened scales, yielding to every movement of the body, while they protect the sensitive surface from unwholesome influences. These little scales are worn off by washing and friction of the clothes; but their place is continually supplied by others. They are too small to be visible, except when they peel off in large masses, as in some cases of fever, and on the scalp, 'where they become entangled with the hair, and give rise to the appearance called "scurf." This observation will show how futile any attempt must be which shall have for its object to prevent the formation of scurf. It may be removed, and should be removed, every day with the hair-brush; but prevention is impossible, inasmuch as it is opposed to a law of nature.'

The chemical composition of the scarf-skin is found to be albuminous, similar to the white of eggs dried. The philosophy of ablution is explained by the fact, that albumen is soluble in the alkalies which enter into the substance of soap. 'The excess of alkali combines with the oily fluid with which the skin is naturally bedewed, removes it in the form of an emulsion, and with it a portion of the dirt. Another portion of the alkali softens and dissolves the superficial stratum of the scarf-skin, and when this is rubbed off, the rest of the dirt disappears; so that every washing of the skin with soap removes the old face of the scarf-skin, and leaves a new one.'

After showing that the objection to soap, 'as an irritant,' may be attributed to weak health or foolish habits, and the injurious effects of 'wash-powders,' or any other 'sluttish expedient,' in lieu of soap, for the cleansing of the skin, the author specifies the influence of light on the surface of the body. The elementary

* A Practical Treatise on Healthy Skin, &c. By Erasmus Wilson. London: Churchill.

granules of the scarf-skin contain a colouring principle, susceptible of a high degree of stimulation, where light and heat are in excess, as in the torrid zone, whose inhabitants are the darkest of the race. The action of the summer's sun is seen in our own temperate latitudes in increased brownness of the skin, as compared with the paler complexion in winter. In this respect the human being appears to be subject to the same 'law of colour' as the vegetable world.

The nails, as portions of the scarf-skin, claim a share of attention. With ordinary care they may be kept in proper condition, and the deformities avoided which affect more particularly the nails of the toes, and owe their origin to the wearing of short or tight shoes while the foot is growing.

It is the dermis of animals, from which the hair and scarf-skin has been scraped off, that is tanned into leather; its inner surface is composed of meshes containing fat, which, resting on the fat of the body, enable it to resist a sudden blow or pressure. It is by this contrivance that the skin of the sole of the foot has the power of supporting, for a long period, the whole weight of the body; and that the cricketer catches the fast-flying ball with impunity.

The perspiratory system consists of the pores—the minute tubes which penetrate from the surface to the meshes lying beneath the sensitive skin, with the oil-glands and hairs. The tubes are circular, and twisted like a cork-screw, the perspiratory gland being formed by a peculiar fold of the spiral; while the external orifice or pore, in consequence of these convolutions, 'possesses all the advantages of a valvular opening.'

'Taken separately, the little perspiratory tube, with its appended gland, is calculated to awaken in the mind very little idea of the importance of the system to which it belongs; but when the vast numbers of similar organs composing this system are considered, we are led to form some notion, however imperfect, of their probable influence on the health and comfort of the individual.... To arrive at something like an estimate of the value of the perspiratory system in relation to the rest of the organism, I counted the perspiratory pores on the palm of the hand, and found 3528 in a square inch. Now, each of these pores being the aperture of a little tube of about a quarter of an inch long, it follows that, in a square inch of skin on the palm of the hand, there exists a length of tube equal to 882 inches, or 73½ feet. Surely such an amount of *drainage* as seventy-three feet in every square inch of skin, assuming this to be the average for the whole body, is something wonderful, and the thought naturally intrudes itself—what if this *drainage* were obstructed? Could we need a stronger argument for enforcing the necessity of attention to the skin? On the pulps of the fingers, where the ridges of the sensitive layer of the true skin are somewhat finer than in the palm of the hand, the number of pores on a square inch a little exceeded that of the palm; and on the heel, where the ridges are coarser, the number of pores on the square inch was 2268, and the length of tube 567 inches, or 47 feet. To obtain an estimate of the length of tube of the perspiratory system of the whole surface of the body, I think that 2800 might be taken as a fair average of the number of pores in the square inch, and 700, consequently, of the number of inches in length. Now, *the number of square inches of surface in a man of ordinary height and bulk is* 2500; *the number of pores, therefore,* 7,000,000; *and the number of inches of perspiratory tube,* 7,750,000; *that is,* 145,833 *feet, or* 48,600 *yards, or nearly twenty-eight miles.*

'The regulation of the temperature of the body is only one of the purposes fulfilled by the perspiration; another, and an important one, is the removal from the system of a number of compounds noxious to animal life. It was estimated by Lavoisier and Seguin, that eight grains of perspiration were exhaled by the skin in the course of a minute—a quantity which is equivalent to thirty-three ounces in twenty-four hours.... When the perspiration is checked, from disorder of the skin or cold, the whole of these matters fail of being removed, and are circulated through the system by the blood. Under favourable circumstances, they are separated from the latter by the kidneys, the liver, or the lungs, but not without disturbing the equilibrium of action of those organs, and sometimes being the cause of disease. The perspiration is a fluid, whose regularity and continuance of exhalation are not merely conducive, but absolutely necessary to health.'

Viewed as an absorptive agent, the skin would be exposed to the danger of transmitting infectious miasm to the fluids of the body, were it not for the oily condition of the epidermis when in a state of health, which renders absorption impossible. Medicines have, however, been applied through the skin by a process known as the *endermic* method: the scarf-skin is removed by means of a blister, and the medicines sprinkled on the exposed surface, where they have been found to act as rapidly as when taken into the stomach. The practice has been followed in hydrophobia and other diseases, in cases when the introduction of remedies by the natural means was impossible.

There is great similarity between the perspiratory apparatus and that by which the surface of the skin is oiled: the tubes penetrate the two skins, and terminate in glands in the network beneath; with this difference, that while the former are spiral, and found on every part of the body, the latter are, with very few exceptions, straight, larger in diameter, and are deficient in certain parts, as on the palm of the hand and sole of the foot; while in situations where they are most required, they are most abundant, as on the face, nose, head, ears, &c. They open along the edge of the eyelids, and prevent the eyes from becoming glued together when closed; they supply wax to the ears; and clustering thickly in the scalp, 'open in pairs into the sheath of the hair, supplying it with a pomatum of nature's own preparing.'

A very remarkable fact in natural history, associated with the oil tubes, was discovered a few years ago by Dr Simon, a German physician—namely, the presence of minute animals in the unctuous matter. Mr Wilson having read of the discovery, devoted himself almost exclusively, during six months, to its investigation; and in the course of his inquiry, examined many thousands of the animals in their development from the egg to full growth, of which he gave a full account in the Philosophical Transactions for 1844, describing the animalcules by the name of *entozoon folliculorum.**

These little animals are invisible without the aid of a microscope; 'forty-five, placed end to end, would measure in length only one inch. In form and shape, in the perfect state, they are very like caterpillars, and have a distinct head, with feelers, a chest, with four pairs of legs, and a long tail. The whole body is so transparent, that its interior may be easily seen, and the animal always occupies the same position in the oil-tube—the head being directed inwards, and the tail towards the aperture of the tube, as though it had crept into that situation from without.' No age or condition of life is free from these minute intruders; but they are more numerous in old age, and during sickness, than at any other period. Mr Wilson concludes that the animals serve a beneficent purpose, by 'disintegration of the over-distended cells, and the stimulation of the tubes to perform their office more efficiently.' He has discovered them in the horse and dog as well as in the human being.

We have next a chapter on the nature and structure of the hairs, and the purposes they serve in the animal economy, in connexion with the oily and perspiratory apparatus; from which we gather, in passing, that the beard grows at the rate 'of six inches and a half in the course of a year; and for a man of eighty years of age, twenty-seven feet will have fallen before the edge of the razor.' The author disbelieves the statements that hair

* The living inhabitant of the follicles (that is, oil tubes) of the skin.

has turned white in a single night, or even in a single week; the first step in the change may have been made in a single night, and on that night-week the whole of the hairs of the head may have become white at their roots; this is perfectly possible, and the only reasonable explanation of the circumstance.

'The influence of diet on the health of the skin' is the part of the subject next treated of. 'The temperature of health,' we are told, 'is a genial summer over the whole surface; and when that exists, the system cannot be otherwise than well. This brings me to the rule of health which I wish to establish; namely, *by food, by raiment, by exercise, and by ablution, to maintain and preserve an agreeable warmth of the skin.* Everything above this is suspicious; everything below noxious and dangerous.' After showing in what way food contributes to the heat of the body, and insisting on the necessity for its soundness and freshness, combined with moderation in eating, Mr Wilson discusses the question of clothing, which 'in itself has no property of bestowing heat, but is chiefly useful in preventing the dispersion of the temperature of the body. . . . Our garments retain a stratum of air, kept constantly warm by its contact with the body; and as the external temperature diminishes, we increase the number of layers by which the person is enveloped. Every one is practically aware that a loose dress is much warmer than one which fits close, that a loose glove is warmer than a tight one, and that a loose boot or shoe, in the same manner, bestows greater warmth than one of smaller dimensions. The explanation is obvious: the loose dress encloses a thin stratum of air, which the tight dress is incapable of doing.' In the remarks on the suitability of various articles of clothing, we learn that the greater warmth of thick woollen textures over thin ones of the same material, consists in the retention of a greater body of air in their meshes. Linen, though 'a soft and agreeable covering . . . . has its objections: it is a good conductor, and bad radiator of heat, and therefore the very opposite of a warm dress, which should be a *bad conductor* and *good radiator*.' Although cotton does not impart that feeling of 'freshness' to the skin communicated by linen, it is far preferable as a covering; it absorbs less moisture, and maintains the body at a more equable temperature. 'Wool is one of the worst conductors and best radiators of heat, and is on this account a valuable and indispensable means of preserving the bodily heat in the winter of cold climates like our own; and even in the summer it is a serviceable defence against colds and rheumatism.'

Mr Wilson urges the necessity for regulating the amount of clothing in accordance with the season and external temperature; and gives a table to show, by comparison, the greater age attained by those whose circumstances enable them to attend to this particular. Of one hundred persons of the richer and poorer classes respectively, from the age of eighty to ninety, the common rate of mortality being nineteen and a fraction per cent., while the whole hundred of the latter died, only thirteen died of the former. The fatal effects of cold, both in infancy and old age, are pointed out. 'The mortality of infants during the first year of their life amounts, in Paris, to nearly nineteen per cent.; in the whole of France, to twenty-one and a half per cent.; in Philadelphia, to twenty-two per cent.; in Berlin, to twenty-five per cent.; and in St Petersburg, to thirty-one per cent.'

The author justly animadverts on the folly and cruelty of dressing children as 'young Highlanders,' or in any other insufficient and fantastic manner. 'There can enter into the parent mind no more baneful idea than that of rendering children "hardy" by exposing them unnecessarily to cold, and by clothing them inefficiently. . . . *One-sixth of the deaths of young children*, it must be remembered, *result from cold*.' In connexion with this part of the subject, we find observations on the dangerous consequences of long exposure to a low temperature, and the suppression of perspiration, in producing derangement of the internal organs.

Mr Wilson has some sensible remarks on the influence of exercise on the skin. His idea of exercise is, that it should embrace the mind as well as the body. 'What is it,' he asks, 'that makes the difference between the exercise of youth and that of the felon on the treadwheel; between the pedestrian in the Isle of Wight or Switzerland, and the pedestrian from Chelsea to the Bank; between the light and quick footstep wending to Greenwich Park, and the dull tread of the nursery-maid at home? Is it not mind? Is it not the young and buoyant joy of the schoolboy that inspirits his laugh and his leap? Is it not the novelty or the beauty of the scene, the pleasant weather, or the immunity from customary labour, that gives spirit to the pedestrian's tour, as compared with the dull, desultory repetition of the same sights, same persons, same things, and same path from and to business? . . . . In mind lies the great secret of *beneficial exercise*; and without it, exercise is a misnomer, and a fraud upon the constitution. . . . The injurious effects of neglected exercise cannot be better illustrated than in the medical history of those who are compelled to lead a sedentary life. In such persons we find a pallid and discoloured skin, depressed spirits, incapacity for exertion, headache, frequently palpitations of the heart, fulness of the head, dyspepsia, tendency to biliousness, and general imperfection and irregularity of the alimentary functions.' The absurdity of repressing the noisy and boisterous sports of childhood is too obvious to require comment. The equally absurd custom of confining young girls in stays, and of repressing their merry games and their appetites, with the view of rendering them 'ladylike,' cannot be too forcibly reprehended.

'Walking, when practised with a proper regard to physical conditions, bestows all the advantages which are to be derived from exercise. It favours digestion and nutrition, facilitates respiration, stimulates the skin, and promotes its action; increases the temperature of the body, and invigorates the physical and mental powers.'

At this point we come to the remarks on the influence of ablution and bathing on the health of the skin, to which the preceding chapters serve as a substructure. We have already seen that the scarf-skin is constantly thrown off in minute scales: the clothing, however, retains them in contact with the surface of the body, where they mix with the unctuous and saline excretions, forming a crust, which, while it collects dust and dirt, chokes the pores, and impedes transpiration. There is also the risk of absorption of the effete matter while it remains on the skin, in which case the lungs, kidneys, liver, or bowels, are called upon to perform double duty, to rid the system of the noxious accumulation; by which means these organs frequently become diseased: while, on the other hand, the obstruction of the pores interferes with the chemical processes of nutrition, the animal temperature is lowered, and cutaneous eruptions are engendered. 'With such considerations as these before us,' says our author, 'ablution becomes a necessity which needs no further argument to enforce strict attention to its observance.'

Mr Wilson enters into the subject of the various methods of ablution, and recommends *training* to those unaccustomed to wash the whole surface of the body daily, beginning with warm or tepid water, as most agreeable to the sensations, and gradually diminishing the temperature, until quite cold may be constantly used. Temporary trials are, however, useless: the practice must be persevered in to insure the whole moral and physical effect. Those with whom it is a daily habit, can alone appreciate 'the warm glow,' while 'the thrill of health which follows is positively delicious.'

The concluding portion of the work is occupied with the question of the diseases of the skin, and their mode of treatment. Warts and corns come in for a share of attention, and, like most cutaneous disorders, are shown to be more easy of removal than is commonly imagined. The author condemns the practice of ignorantly using

'old women's' remedies, many of which are highly pernicious.

We take our leave of Mr Wilson's book with a hearty wish for its success and wide diffusion. The subject is one of essential interest to every class of the community, and commends itself especially to those who are helping on the great cause of humanity.

MY NEPHEW THE LAIRD.

The prophetic doubts of my good aunt, the captain's shrewd-judging lady, did not fail in time to be very painfully realised. Though widely separated from my Highland kindred, I had kept up a correspondence with the principal members of my brother's family, sometimes hearing from himself of some new golden project, now and then from his wife—latterly to complain of an increasing dulness in the neighbouring society—and very constantly from the elder children, to whom I had had the extreme comfort of sending a young woman, of superior understanding, as their governess. About the time that my two eldest nephews came to England, to a public school, rumours of my brother's embarrassments began to be current around him. Without any very expensive habits, he and his lady got through large sums of money, which even the better resources of their improved management failed to supply. Besides their hospitable summers, there were winter visits to Edinburgh, Dublin, and sometimes London; with no farm at hand to aid in housekeeping, when some ready money being of absolute necessity, it had often to be raised at ruinous interest. Then came the system of long credits, bills renewable, a trust-deed—all vain attempts to stave off, for some indefinite period, the crash, which every expedient to avert tended but to aggravate the weight of. It came at last, and it was overwhelming. The trustees entered upon the administration of the property, and my brother had to remove with his family, to live where he pleased, on a very slender annuity.

At first they went abroad, but the continent not suiting either himself or his wife, principally from their ignorance of modern languages, they were advised to fix at Cheltenham, to which they were the more inclined, as we were enabled to lend them a house there. Our Indian uncle, the colonel, had bought a villa on the outskirts of what was then a pretty village, and this his widow had lately left to me. Soon after the completion of this arrangement, our younger brother, who had gone out early in life to Madras as a writer, returned home a wealthy man; and he too settling at Cheltenham, to be near the 'laird'—for never has he been heard to call his elder brother by any other name—and also with a view to the happiness of his wife, who was of a Gloucestershire family, he gathered his scattered children from their various homes, and, applying to the 'laird' for advice in every circumstance of the life equally novel to both, the old age of two men, used to the most active habits in totally dissimilar spheres, where each had commanded, is gliding away, I believe, in quiet happiness. I had feared that my brother 'the laird' would have felt very painfully his descent in position: but no; his seems to be a mind which accommodates itself without effort to events. He considers himself the victim of philanthropy; and, persuaded that his patriotic attempts to improve his place and people were the sole cause of the ruin brought on him and them, he hardly even regrets it. It was the consequence of good intentions; and the schemes in the Highlands failing, he has begun another series in the south, not so costly at any rate, being principally confined to his study, where his fertile brain and ready pen occupy him very profitably, as he writes for several of the higher-toned periodicals.

My sister-in-law is certainly more in her natural sphere where she is. She does not affect to conceal that the change is agreeable to her. The perpetual little party-giving is quite to her mind; so are the dressing, the morning calls, the card-playing: her taste for this mode of getting through part of her time having rather increased as more youthful inclinations have declined. Unluckily for my brother, the loo she so much delighted in was not always limited; but years had brought some degree of prudence along with them, and her gains are beginning to preponderate over her losses. She was still a fine-looking woman when I last saw her: ten years at least younger in appearance than her real age. She had latterly devolved the management of her household on her eldest daughter, who has been taught by adversity the prudence ordinarily the result of half a life's experience. The second daughter, who, from the more intellectual expression of her countenance, surpassed even her mother's early beauty, had married just as the family were leaving the Highlands. She had married greatly—the young 'master' of the neighbouring noble domain, who discovered, at the prospect of parting, that he had been cultivating the society of the brothers for the sister's sake. Though the bride was portionless, she was received with affection, and parted with without elation: like sought like. There was nothing the Highlanders considered uncommon in an accident which we, more worldly-minded, thought so fortunate.

My brother's eldest son, he more peculiarly the subject of my present sketch, had been educated, while at school, with my own boys, passing, too, the most of his holidays with us. Before his college days, the funds were wanting to complete what had been begun: he studied one year only at Edinburgh. The two following he spent at a German university, which he left to accompany his family home, upon their tiring of the continent. We thought him anything but improved by his foreign travels, and we fancied his character still further deteriorated by a couple of seasons at Cheltenham, where, as a handsome beau—à mustaches—he lounged away the mornings, with other idlers, in the High Street, or in the billiard-rooms, or on the cigar benches, while at the evening balls he was the coveted partner of every fair exhibitor, unchecked in his advances by any maternal frowns; it being well known that the Highland estate was entailed, and of course redeemable. His mother rather encouraged his numerous flirtations, almost glorying in his easy conquests: his father, occupied in his study, knew little of what was going forward: the gentle rebuke of his sister he only laughed at. Suddenly he vanished: he joined a party to shoot in the Highlands, and returned no more. He had ventured to his own glen; he wrote his sister word; and he meant to remain there on a visit to my old friend the forester. The next thing we heard of him was, that he was in Edinburgh at college again; then domesticated in some farmer's house in the Lothians; next back to the Highlands; and then came a joint letter from the trustees to announce that, being dissatisfied with the gentleman hitherto charged with the management of the property, they had relieved him from his duties, and had appointed in his stead the person most interested in the retrieval of its difficulties, and, in their estimation, best qualified for a task of such delicacy, from the high testimonials he had brought forward both as to character and abilities. In short, the new manager was my nephew, who, awakened to the value of all he was well-nigh losing, had been fitting himself to attempt the recovery of his birthright. We regretted his next step; for, after a year or two, he married a wife of high degree, brought up in a home of luxury—a daughter of the noble house into which his sister had been adopted. Years passed on, and when events brought my nephew into prominent notice again, the measures he was carrying through necessitated my brother's revisiting Scotland, from whence he returned indeed landless—having made over his whole inheritance to one sole trustee, his son, for ever; who took upon himself every existing debt, and commenced his reign of undivided authority by doubling the annuity paid by the estate to his father.

All the news that ever reached us from the north in-

directly, told of the wonderful improvements my nephew the laird had been successfully carrying on there. But a few appeals had been made directly to the old laird concerning the consequences of certain of his son's changes, which had filled his affectionate heart with grief. In some cases whole families, whose existence upon the lands had been coeval with our own possession of them, having been deprived of their small holdings, had emigrated to America; others had abandoned their homes to settle in the burgh town, or to seek their precarious fortunes elsewhere; while a few lingered on where they were born, loath to leave scenes that were dear to them, though without any means of subsistence beyond the charity of their relations. My brother felt some delicacy in interfering with a son who had acted so generously to himself, while he was distressed at the idea of abandoning the interests of those over whom Providence had once placed him as their protector. From my nephew having passed so much of his boyhood in my family, he knew that he had an old affection for me, and that I had some influence over him; so he thought it would be of considerable use to all parties if I could make up my mind to pay a visit to the glen. It was not altogether an agreeable duty; but it was one which seemed to have been thrown in my way, and from which, therefore, I did not feel it right to shrink; so I consented.

My former journey north had occupied nearly a fortnight: we were five days on the road between London and Edinburgh, and five more between Edinburgh and the glen, with a rest in Edinburgh, much needed. On the present occasion we landed at my nephew's door on the third evening after leaving town, travelling by railway to Liverpool, by steamboat along the coast, and up the lochs to the new pier, built out near the promontory where stands the church, just concealed by a bank of weeping-birch from the castle. A thriving village had risen round the pier, in which was a good inn, several shops, and a post-office—the mail now going regularly across that part of the country which was formerly termed the new road; besides two coaches—one daily, the other thrice a-week—and an omnibus, for tourists only, who engaged it for the trip, which always occupied the same number of days, and embraced the same round of scenery. A road really new to me turned up from this village through the glen, passing the old castle, and stretching up across part of the forest to meet another new line of road, connecting districts hardly known before. The castle was in high preservation, the pleasure-grounds much extended, and beautifully kept; while the wide meadow on either side the stream lay in large level fields, bearing the most luxuriant crops, far up into the birch wooding. My nephew did not live there. It was let, with the shooting, to an English millionaire; who paid nearly as much for his six weeks' amusement as supported my poor brother's diminished state at Cheltenham. My nephew lived in the new house, as it was still called; for the captain and his worthy lady were both dead. The widow had indeed been living when my nephew first returned to the glen; and he had gone, at her desire, to visit her—a visit which never ended, for they remained together till her death, when he inherited all her worldly goods, all the gatherings of her later savings, all the labours of her busy years, with the various heirlooms of the family, carefully collected and treasured up by this last of the old race. I had expected improvements to have been made at the mansion, but I was quite unprepared for their extent. The bare moor had become a perfect garden; large fields lay around, intersected by belts of plantations almost to the door, from which they were separated by a shrubbery, enclosing a perfect gem of a little flower-garden, with a small conservatory attached to the house. One of the square wings was gone, its materials having assisted in the erection of a commodious set of offices behind, to which all the straggling sheds of former days had also contributed. The other wing had had its front wall carried up to a gable end, its two narrow casements below altered into one large bay-window, the terraced roof of which, filled with flowers, served as a balcony to the two enlarged casements above. A wide porch had been added to the doorway, covered with creeping plants. And this in a wild Highland glen!—wild no longer. The mountain range around, and the little foaming river, now scantily fringed with birch, were all that remained of the rude Highlands.

The change within was even greater. My mother's parlour and bedroom, thrown into one long room by the help of supporting pillars, was fitted up as a library, and was the sitting-room of the family. In the recess of the bay-window was placed a large, round table, covered with books and writing-materials; in the side wall, doors of glass opened into the conservatory; at the farther end a pianoforte, a violoncello-case, and a high stand full of music, denoted the happy employment of many an evening hour; near the fire was the old cornered chair, new-covered with needlework, exactly copied from the faded, worn original: all my mother's chairs found places, too, as stationaries, intermixed with some of a lighter make; the little tea-table, with its egg-shell china, was set before a side window, opening on a small courtyard at the back of the greenhouse appropriated to pet birds. The whole thing spoke of home-occupations and home-happiness, to increase which, every memorial of the past appeared to have been studiously introduced; and it affected me even to tears when I found myself alone there, after walking up from the steamboat a mile and a half or more, unnoticed by any one; for we had not been expected—they had not looked for us till the next boat, not reckoning on our timing our changes of conveyance so accurately. By the advice of the governess, who shortly made her appearance with the younger part of her happy-looking charge, I occupied the time that must be passed before the return home of my nephew and niece with their elder children, in taking a review of the pretty cottage into which the old house had been metamorphosed. Taste and comfort were happily blended throughout all the arrangements, united with the most economical simplicity. Nothing my good Aunt Nelly had left was missing, though there were many additions suited to modern refinement. The old dining-room had been shortened, to give my nephew not a study, but an office; for it was plain that business was in earnest pursued here. The back 'jamb' had been extended indefinitely as part of a range of farm-offices, evidently superintended by a lady's eye. The entrance-hall alone looked feudal; for in it were neatly arranged upon the walls my father's swords, the captain's pistols, and some old battle-axes, leathern shields, old claymores, and such-like antiquities, intermixed with stags' horns and stuffed otters, which my nephew had fallen upon in the garrets when remodelling his residence. I was particularly touched by this careful preservation of every object connected with the olden time; for even the flower-case and the filigree box of my poor old French governess remained in their own place, though the drawing-room did duty now as the children's study. Where the Grecian and Egyptian curiosities had taken refuge, I know not: probably in the bedrooms of the castle; for no remains of them were to be seen in the cottage, and the millionaire had entirely refurnished his reception-rooms in what he called the Highland style—all tartan, dirks, broadswords, and bog oak.

I was warmly welcomed by my nephew and niece; made one of the family at once; consulted, and employed, and appealed to as another of themselves; where all, big and little, master and servant, parent and child, seemed to have but one common interest. We were early up, early to bed, busy all day; and we enjoyed our short evening as only those can enjoy the hours of relaxation who have earned them by daily duties well performed. We did not live alone. Several of the nearer landed proprietors, whose pursuits were beginning to assimilate in some degree with

my nephew's, with the addition, occasionally, of the family retainers, formed an agreeable society, amongst whom no formalities existed, and who seemed to enjoy the easy intercourse prevailing in their unceremonious visits to one another all the more, that display was altogether unthought of as a mode of entertainment. Higher sources of enjoyment have opened upon the rising generation than were ever dreamt of by their ancestors. Conversing with my nephew on his wonderfully altered habits, he told me that he dated the change from the time that a sense of duty dawned upon him. He had wakened from the follies of a frivolous existence to see the inheritance of his family passing from them; the people, whose interests had been delegated to his care, suffering from his desertion. His pride of birth, first humbled, was then aroused, and the keen desire to redeem his station took entire possession of his very energetic mind. Encouraged by the forester, stimulated and assisted by the captain's widow, he first fitted himself for the serious task he had undertaken; and then beginning by managing for others, he proved himself to have become the best manager for all. His character had won him his wife. Her little fortune, and her father's influence, had been of considerable use to him in assisting plans he still pursued as a trustee. He lived upon the allowance he received as manager, grudging no outlay on the estate that would afterwards pay, yet restricting even that to a certain annual sum, while faithfully, year after year, relieving the property of its heavy encumbrances. He had no factor, managing all his own affairs himself. He had two working grieves and a forester, who received their daily orders, and had their labours daily inspected; and he had a bookkeeper, chosen, like his other assistants, not for his kindred or his destitution, but for his efficiency in his particular department. His farms were models; and he had many—for here it was that the young laird had offended. The good of the property was his aim so exclusively, that he never permitted private feelings to interfere with what he thought essential to it. He said that where he had found it possible, he had left all the old people in their old places; but that the change of manners had necessitated many removals. He required no band of idlers round him; therefore some were thrown out of bread, whose former dependent existence had quite unfitted them for regular work. A few he had quite reclaimed; some partly; some were not to be reclaimed, and they had either hung on at home, living on more industrious relations, or they had enlisted or emigrated, often assisted by himself, as he owed them help, and was willing to give it. He had had most trouble with his class of small tenants—honest, respectable men, living poorly enough on the few acres their ancestors for centuries back had tilled, much in the same style, too, with their own slovenly system of management; for they were proud, idle, poor, and doggedly opposed to any innovations on the habits of their forefathers. These continued to live in the smoky turf-huts, and to lie in the airless box-beds: they called trees big weeds, and thought flowers an encumbrance; and the better crops, and the increasing comforts of their more docile neighbours, all so many preparations for expediting the approach of the day of judgment. With such thorough men of the old school, it had been extremely difficult to deal. It was these principally who had emigrated to the new world rather than conform to the times in their old places; and some of them, despite their obstinacy, I could not but regret; for from amongst them, when thrown by different accidents into the current of the world, had sprung men who left these lowly roofs to rise, by their own exertions, to the highest honours of the state. But my nephew was not of an age or a temperament to believe there would ever be any want of force to fill the vacancies: to him these sturdy fathers of the great were so many obstinate old men, who were predetermined never to try to extract its full value from the soil; and therefore, in his eyes only encumbering it, he joyfully seized every opportunity of assisting in their removal.

He was opposed to the whole system of jobbing. He said it had hitherto been the ruin of the country, as we might see in our own family, and in that of my poor Aunt Grace, the last of whose descendants, the boy she brought over the lake to see me on my former visit to the north, having just started for Australia, after parcelling out what was once a fine property amongst a whole bevy of small purchasers. He would put none into situations they could not honestly fill; he would help the unfortunate to the best of his ability; but he would leave no land with Black Donald's son, or any other body's son, who would not or could not improve it; nor should old Bell's grandson mismanage a saw-mill, had the old woman been foster-sister to a score of lairds. The factor, our cousin's son, need not have bristled up at the ill usage he met with in being passed over for a stranger. He required no factor: the stranger bookkeeper did what the cousin could not do—work; to which he had been bred, and for which he was well fitted. With these sentiments all in active operation, the glen had indeed made strides. Three or four large farms, managed by my nephew's advice, were in the hands of young scions of some of the old stocks; the rest he superintended himself, and cultivated to the utmost—large, level, well-fenced, thorough-drained fields, bearing crops that were a marvel in the Highlands. Still I, like the old useless retainers, felt some regret. A wise writer has remarked, that the actual living present has little interest for the bulk of mankind; that the young are looking hopefully forward to the unknown future; while the elderly return in thought to the fondly-cherished past, where the melancholy which forms the tenderest part of memory mingles with all recollections. It must have been this natural inclination of the mind which made me, in thinking of my native glen, pass over its present flourishing condition, and revert to it as I knew it in my youth, during the bright summer I spent among its beauties when my brother was the laird. The people were then just beginning to arouse from the sleep of ages; new ideas and new wants were just dawning upon the rising race, while the old feelings, and habits, and prejudices, were still the creed of their fathers. It was this that made them so interesting, so unlike the world we left when we came to visit them in the recesses of their mountains; and this was wearing gradually away before the advance of more useful business habits. I could never reconcile myself either to the smoke, and the fizzing, and the racket of the steamboat rushing over our once secluded lake, or to the bustle of the village on its shore. I missed too, through the glen, all the pretty crofts, stolen, as it were, from the birch-woods: they were all gone, the timber of their hanging banks cut and stacked for sale, the heights and hollows levelled, and all the little wild paths through this once graceful wooding, leading from one little sheltered farm to another, existed now only in the memory of such as I, who had loved to linger the long summer hours among scenes so quietly beautiful.

In the forest too, we no longer came upon the solitary woodman felling and barking his tree, or on a half-ruined saw-mill with its leaking watercourse, offering itself to the pencil with all its picturesque infirmities—the sawyer lazily reading, while the tardy log moved on. All this had vanished. A small part of the forest was cut down in rotation yearly, immediately enclosed, and left to nature to replenish. One band of active workmen felled, another barked, another stacked; all roots were raised; horses for the purpose carried the logs to the only mill, an immense building, with a large artificial supply of water, and a yard attached, where the wood was sorted. The thorough air of business interested me here in spite of myself: the regularity astonished me; as did the amount of work done, by which no one, however, seemed oppressed—method making all easy, even to Highlanders. With his workmen my

nephew was a favourite, nor can I say that he was out of favour with any, even of those drones whom he would banish from the hive. He was forgiven much, on account of his position—acting, as they insisted, for my brother; redeeming his father's property at his own risk—and they excused his stern utilitarianism, on account of the several disadvantages he had laboured under. A foreign mother, a foreign nurse, latterly a foreign education, they could not expect his heart to be all Highland. The wiser among them were beginning, too, to be quite sensible of the substantial benefits his rule had brought with it; money, with all the comforts it can buy, being no longer scarce with the industrious. They had regular pay, good houses, shops in the village at hand, a market at their door for their produce, help in sickness, a good minister, and a good school. It was in these latter departments that my nephew's wife most interested herself.

My niece was scarcely handsome, being fair and slight, and wanting height; yet she grew on me as beautiful, from her sweet, cheerful temper, her goodness, her activity, and her cleverness; all these resources of her mind, too, called forth solely by her love of home. It was to enliven her home that she produced her accomplishments, to improve her home that she exerted her various talents; regulating her household so quietly, pursuing her various employments so steadily, associating her elder children with all her works. She was really a help meet for her husband, beloved throughout his whole estate, the support and the solace of all around her. No 'lady' had ever yet so truly possessed the affections of the people. She was of ancient Highland blood too, and understood their ways, and shared most of their feelings. The young laird owed more of the respect he met with than he was at all aware of to the 'gentle Lady Anne.' The employment which, next to her home duties, appeared the most particularly to interest her, was her charge of the newly-founded schools, where she taught daily, not as in the old times of birch rods and Latin grammar, but according to the improving views of the age upon this most important subject. Then she had a school of industry upon a plan of her own, where all of any age got work, if they wished for it, with a small magazine where their labours were sold. A dispensary was under the care of an hospital assistant, whose practice was directed by the weekly visit of the doctor from the neighbouring town, and who received a small salary from the laird to compensate for the low price of his advice and medicines. A soup-kitchen and a linen store belonged to the institution, carefully superintended by my active niece. And all this was done so easily, so cheaply, time being much more abundantly bestowed than money.

Such is the glen as my nephew has made it—changed by the progress of years, aided by the energies of one powerful mind. He has taught his people to help themselves; he has altered their blind submission into a reasonable attachment; and though, from circumstances as much as from character, he may have been a little rigid in the straight course, the end was certain, and worth achieving at any price. Though the poetry of the connexion between the laird and the vassal has undoubtedly suffered by the tie to the *race* being broken, yet affection for the *man*, always given when deserved, may be a higher and a surer bond between them. With such thorough business habits, it will not be supposed that he much encouraged the gaieties formerly so essential to the happiness of the Highlander. He kept up the ball and supper at harvest-home, the dinner at Christmas, and the feast in the hill at the sheep-shearing; but there was no whisky admitted to the entertainments, and they were early over. He discountenanced in every way the expensive funerals, the noisy weddings, the numerous excuses for gatherings, which seldom ended in the good of the younger part of the company. Indeed the tastes of the people were outgrowing the mirth raised by the punch-bowl: a tone of higher enjoyment was gradually expanding over their feelings, which was assiduously fostered, and wisely directed.

The minister was another of my nephew's lucky hits—a truly well-educated man, anxious for the morals of his flock, proving by his own habits the worth of the Christian precepts he inculcated. He was neither kith nor kin to our family. He preached well, visited his flock unceasingly, abounding in the works of truly gospel charity. His congregation was large, and extremely attentive, but by no means so interesting to me as that of former days. The young men in their fashionable attire did not look half so well as in the plaid. The smart caps, or the very finely-trimmed bonnets of the younger women, were frightful to me, whose thoughts returned to the glossy snood-bound hair of their comely mothers. Old age was less marked, youth was less picturesque; there were few high caps, no groans, no dogs; and the psalms, skilfully sung in parts by the children of my niece's schools, had no resemblance to the line-by-line-delivered noises of the ancient precentor, taken up in every key and every tune guessed at by the congregation.

The world has reached the glen: every-day life now meets us there: the romance of the Highlands is gone: they will soon offer few distinctive peculiarities. Another generation will very faintly trace the remains of the manners of their primitive forefathers, and the records of scenes I have lived in will be as Robin Hood's tales to my grandchildren.

I took leave of my nephew with sorrow. At seventy odd years, old ladies, even in these days of steaming comfort, travel uneasily. I felt, when I quitted the glen, that its beauties, except in memory, had closed on me for ever.

UNRESTRICTED DANGERS.

Two things, involving liability to great loss of life and damage of property, are left almost without any means of prevention or control in this country. The first is the erection of houses, and other buildings of various kinds. It is found that the greater number of fires originate in flues. Beams of wood are carelessly built in connexion with chimneys; the beams catch fire, and the house is burnt, to the great loss of the proprietor or the insurers. The beams which support the flooring of a house are also sometimes too slender and too short; in some instances the ends have not a rest of more than two inches on the walls. The builder coolly and stupidly sees this done, and nobody but himself knows anything about it. Some day, years afterwards, there is a more than usually large meeting in one of the apartments—perhaps a sale of furniture, perhaps a festive assemblage. All at once the slender beams yield to the pressure, and, slipping out of the wall, down goes the floor, with all who have the misfortune to be upon it. The accident, as it is called, produces a great sensation; several people are killed or maimed; but the author of the disaster is unscathed; the builder has long since been paid for his job, and he is such a decent man, that nobody thinks of blaming him. From similar blunders a newly-built factory falls down, and many poor workmen are destroyed, leaving a number of orphans and widows to be supported by the public; yet great as is the loss, it leads to the adoption of no preventive—everything goes on as usual.

The second, causing a still more flagrant loss of life and property, is the employment of any kind of ships, and any kind of skippers, in our commercial marine. Although a ship is rotten, and unfit for service, it will be loaded with goods for a distant part of the world; and as to the commander, he may know no more of navigation than his own cabin-boy, if even so much. But do not the shippers of goods look into this? No. Because, if the ship is lost, the entire value of the goods is paid by the insurers. Then, do not the insurers look into it? No. They charge for what they consider the

risk, and if they win, they have made a good profit. The whole thing is a species of gambling. If all vessels were seaworthy, and all captains able seamen, underwriting would be nearly extinguished; and that would not be pleasant.

The revelations made before parliament on this subject are appalling. The following piece of evidence occurs in a blue-book on shipwrecks. A witness being asked how shippers of goods in merchant vessels should proceed in the very strange way they seemed to do, he answered that it arose—'From a variety of motives: from being perfectly irresponsible; from there being no authority to investigate their actions or scrutinise their conduct; and from the destructive effects of insurance in removing all motives to care. No one can go into the city, or have transactions with the fitting out of merchant ships, without witnessing, in daily transactions, the fatal extent of the carelessness which prevails in the selection of the master, officers, and men, and in the equipment of merchant vessels. Any man who can procure a loading for the vessel from any foreign port, will seldom be refused the appointment of master, or have any inquiry made into his character. I have even known a Portsmouth publican who commanded a vessel trading from Lisbon to London.'

'Was this man versed in navigation, or capable of taking an observation had the vessel driven out of its course?' 'No: he had evidently not the most distant conception of it, but depended on the empirical knowledge of one of the seamen. I once sailed from London with ninety persons (in 1835) in a steam-vessel which was highly insured, commanded by a man whose thorough ignorance and habitual drunkenness were such, that I was called upon by the officers and crew, for the safety of the vessel and lives, to take the command out of his hands; which I did. When he got on shore, he cut his throat in a fit of *delirium tremens*. The man's character must have become known to the owners, had it been their interest to make any inquiry upon the subject. I once came home from Portugal in a brig of two hundred tons, when the second mate was the only one on board who knew navigation, the master being perfectly ignorant of that science; the result of which was, that, in a run of five or six days, with a fair wind, we made Cape Clear instead of the Land's End, being bound to London from Cape Finisterre. Seeing the evident danger of such ignorance, I was compelled to interfere to control the vessel. Such instances are constant and notorious, from the circumstance of *examination* being neglected, and qualification being considered unnecessary in the merchant service. Not only is there no interest in getting good hands, but there is a fearful effect in going short-handed. Merchant vessels are to a shameful extent inadequately manned. I once came to England in a brig which could only afford two hands to each watch. The man at the helm was frequently obliged to leave his post to let go ropes in a squall at night. In one case the vessel was almost lost from this circumstance off Cape St Vincent. In a moderate gale, it was necessary to cut away from the yard a fore-top-sail, which could not be furled, from her having only three men and two boys in a vessel of 250 tons.'

'If the lives of the men are lost, does the widowhood or orphanage or any such loss fall on the owners?' 'No: on the contrary, the owners frequently gain. In the case of the loss of the vessel, there is no claim for wages, and the parish supports the widows and orphans, if any of the men happen to be married.'

'Are the losses ascribable to ignorance, and are those losses very great?' 'Yes: I believe it has been ascertained, beyond contradiction, that the number of British ships which is lost is more than one in twenty-four; and that property to the value of nearly three millions annually is thus lost to the nation; chiefly through ignorance and the present system of nautical insurance, which assures any vessel, on good premium, however unsafe or decayed. Further, that for every *seventeen* sailors who die, *twelve* are drowned or lost by shipwreck; and that nearly two thousand perish annually in the deep. Thus hundreds of widows and thousands of children are thrown on the precarious charity of the public.'

It appears to us, as it has long since appeared to others, that the only remedy for these public and private wrongs is to place the erection of all edifices, and the sailing of all ships, under the supervision of educated and responsible surveyors; and to oblige shippers to employ only properly-trained and licensed commanders. The legislature, we believe, has some such arrangement in view; and if so, it is very desirable it were hastened to a practical issue.

ADVENTURE OF HERMAN MELVILLE.

Mr Melville, according to his own account,* was a sailor on board the 'Dolly,' an American whaler, which visited the cruising-grounds of the Pacific in the year 1842. The vessel had been six months at sea, out of sight of land, chasing the sperm-whale beneath the scorching sun of the line—the sky above, the sea around, and nothing else. Many weeks had elapsed since her fresh provisions had been all exhausted; there was not a single yam or sweet potato left; nothing but salt horse and sea-biscuit, nothing green or fresh to look upon save the inside of her bulwarks, and these were of a vile and sickly hue. To aggravate these evils, unendurable enough in all conscience, the commander was a harsh, selfish fellow, who would not have cared, so long as his own wants were attended to, though his men had been living on salted plank. No wonder that, under these circumstances, the crew became land-sick, and that visions of verdant islands, happy valleys, tropical fruits and flowers, desertion and liberty, floated before their minds. The captain's store of delicacies was not everlasting, however; an appeal to his stomach was more powerful than one to his heart, and so the Dolly's prow was at length turned landward. The Marquesas was her destination; and thither, in eighteen or twenty days, the gentle trade-winds wafted her yearning crew. It was in the summer of 1842 that they dropped anchor in the bay of Nukuheva, and just at the time that the French Rear-Admiral Du Petit Thouars was taking measures for the subjugation of these islands. The bay and valley of Nukuheva were of course in great commotion. It was high gala-day with the crew of the Dolly; and the temptations of the island, rendered doubly powerful by the memory of the harsh treatment they had experienced at sea, told among them, as might have been expected. Here, then, Herman Melville, in company with another shipmate, made up his mind to desert, and to take his chance among the natives until some more kindly craft might appear for his reception.

Having made their escape in their ordinary sailor dress, with no implements save their knives, and no stores save a few biscuit, a pound or two of tobacco, and a piece of calico to serve as a present to the natives in case of need, our two runaways made for the heights of Nukuheva, whence they might watch the departure of the Dolly, and be out of reach of the inhabitants, who never leave the bosoms of their valleys—each tribe possessing its own vale, to which they are confined at once by the surrounding heights and the fear of their neighbours. To these heights they forced their way through jungle and cane-brake, drenched to the skin by heavy rains, bruised, torn, and bleeding. At the height of 3000 feet night fell around them, cold, weary, and hungry; the rain and friction had ground their biscuit to pulp, and this pulp was rendered all but uneatable by the juice of the tobacco, which had been thrust into the same receptacle. They looked around them for fruit, but they were above the region of the cocoa-nut and bread-tree; and, unsavoury as their bis-

* Narrative of a Four Months' Residence among the Natives of a valley of the Marquesas Islands. By Herman Melville. London: Murray. 1846.

cuit pulp might be, it was their only resource. What they had might have sufficed for a single meal, but the Dolly would not sail for eight or ten days, and to descend from their security till then, would be to defeat the project for which they had already hazarded their fame and fortune. What then was to be done? 'After a brief discussion, in which both of us expressed our resolution of not descending into the bay until the ship's departure, I suggested to my companion that, little of it as there was, we should divide the bread into six equal portions, each of which should be a day's allowance for both of us. This proposition was assented to; so I took the silk kerchief from my neck, and cutting it with my knife into half-a-dozen equal pieces, proceeded to make an exact division. At first Toby, with a degree of fastidiousness that seemed to me ill-timed, was for picking out the minute particles of tobacco with which the spongy mass was mixed; but against this proceeding I protested, as by such an operation we must have greatly diminished its quantity. When the division was accomplished, we found that a day's allowance for the two was not a great deal more than what a table-spoon might hold. Each separate portion we immediately rolled up in the bit of silk prepared for it; and, joining them altogether into a small package, I committed them, with solemn injunctions of fidelity, to the custody of my companion. For the remainder of that day we resolved to fast, as we had been fortified by a breakfast in the morning; and now starting again to our feet, we looked about us for a shelter during the night, which, from the appearance of the heavens, promised to be a dark and tempestuous one.'

Still holding inland towards the central heights of the island, from which the valleys radiate like the spokes of a wheel, our adventurers came to a waterfall, under the cliff of which they proposed to rest till the morning. The night was wet and gusty; so, slanting a few fallen branches against the precipice, and covering them with leaves and withered grass, they crept under and disposed their wearied bodies as they could best contrive. 'Shall I ever forget that horrid night? As for poor Toby, I could scarcely get a word out of him. It would have been some consolation to have heard his voice; but he lay shivering the livelong night, like a man afflicted with the palsy, with his knees drawn up to his head, while his back was supported against the dripping side of the rock. During this wretched night there seemed nothing wanting to complete the perfect misery of our condition. The rain descended in such torrents, that our poor shelter proved a mere mockery. In vain did I try to elude the incessant streams that poured upon me. By protecting one part, I only exposed another; and the water was continually finding some new opening through which to drench us. I have had many a ducking in the course of my life, and in general care little about it; but the accumulated horrors of that night, the death-like coldness of the place, the appalling darkness, and the dismal sense of our forlorn condition, almost unmanned me.' As might be expected, the earliest peep of dawn found them stirring from this uncomfortable resting-place; and having despatched their scanty breakfast of biscuit pulp, they were once more on their journey. After three or four days of toilsome wandering by day, and lairing by night under the shelter of rocks or fallen trunks, their miserable stock of provision was consumed; and there was now no alternative but to descend into the first valley, and risk a reception with the natives. To turn back to the Nukuhevans would have been madness, as these people were sure to deliver them up to the vessel in hope of reward; to make a hap-hazard descent was a mere life-lottery—they might fall into the hands of the mild and gentle Happars; but they were quite as likely to enter the valley of the Typees, reputed the most fierce and cannibal of the Marquesans. Descend, however, they must, or starve where they were. Their biscuit crumbs were gone, and the chewing of succulent shoots and young buds was but a temporary expedient.

Taking, then, the first watercourse that offered, they commenced their descent to the more fertile low lands. 'From the narrowness of the gorge, and the steepness of its sides, there was no mode of advancing but by wading through the water; stumbling every moment over the impediments which lay hidden under its surface, or tripping against the huge roots of trees. But the most annoying hindrance we encountered was from a multitude of crooked boughs, which, shooting out almost horizontally from the sides of the chasm, twisted themselves together in fantastic masses almost to the surface of the stream, affording us no passage except under the low arches which they formed. Under these we were obliged to crawl on our hands and feet, sliding along the oozy surface of the rocks, or slipping into the deep pools, and with scarcely light enough to guide us. Occasionally we would strike our heads against some projecting limb of a tree; and while imprudently engaged in rubbing the injured part, would fall sprawling among flinty fragments, cutting and bruising ourselves, whilst the unpitying waters flowed over our prostrate bodies. Belzoni, worming himself through the subterranean passages of the Egyptian catacombs, could not have met with greater impediments than those we here encountered. But we struggled against them manfully, well knowing our only hope lay in advancing. Towards sunset we halted at a spot where we made preparation for passing the night. Here we constructed a shelter in much the same way as before; and crawling into it, endeavoured to forget our sufferings.' Having continued their descent on the following morning, they soon came to a rocky precipice, nearly a hundred feet in depth, that extended all across the channel, and over which the wild stream poured in an unbroken leap. On either hand the walls of the ravine presented their overhanging sides both above and below the fall, affording no means whatever of avoiding the cataract by taking a circuit round it. Desperate men will often accomplish, it is said, what would utterly baffle the most skilful and cautious; and so it was with our adventurers. The sides of the ravine were covered with curious-looking roots, some three or four inches in thickness, and several feet long, which, after twisting among the fissures of the rock, shot perpendicularly over it, and ran tapering to a point in the air, hanging over the gulf like so many dark icicles. They covered nearly the entire surface of one side of the gorge, the lowest of them reaching even to the water. Many were moss-grown, and decayed, with their extremities snapped off; and those in the vicinity of the fall were slippery with moisture. Their scheme was to intrust themselves to these treacherous-looking roots, and, by slipping down from one to another, to gain the bottom! Toby, the lightest and most active, commenced this dangerous descent; our hero followed, cautiously transferring himself from the root down which he first slid to a couple of others that were near it, wisely deeming two strings to his bow better than one, and taking care to test their strength before he trusted his weight to them. 'On arriving towards the end of the second stage in this vertical journey, and shaking the long roots that were round me, to my consternation they snapped off, one after another, like so many pipe stems, and fell in fragments against the side of the gulf, splashing at last into the waters beneath. As one after another the treacherous roots yielded to my grasp, and fell into the torrent, my heart sunk within me. The branches by which I was suspended over the yawning chasm swung to and fro in the air; and I expected them every moment to snap in twain. Appalled at the dreadful fate that menaced me, I clutched frantically at the only large root which remained near me; but in vain. I could not reach it, though my fingers were within a few inches of it. Again and again I tried to reach it; until at length, maddened with the thought of my situation, I swayed myself violently by striking my foot against the side of the rock, and at the instant that I approached the large root, caught desperately at it, and transferred myself to

it. It vibrated violently under the sudden weight, but fortunately did not give way. My brain grew dizzy with the idea of the frightful risk I had just run, and I involuntarily closed my eyes to shut out the view of the depth beneath me. For the instant I was safe, and I uttered a devout ejaculation of thanksgiving for my escape.'

We need not follow our adventurers through every difficulty and hairbreadth escape in their descent to the valley; enough to state that they reached it, worn-out and hungry, and found it the abode, not, as expected, of the gentle Happar, but of the warlike Typee. They were first discovered by a boy and girl, who instantly gave the alarm; and in less than twenty minutes they were surrounded by half the inhabitants of the valley. After considerable scrutiny and questioning—a questioning which was all but unintelligible—the natives seemed pleased with the new-comers, admitted them into one of their best bamboo houses, and placed before them a repast consisting of cocoa milk and poee-poee—the latter a staple article of food among the Marquesans, manufactured from the produce of the bread-fruit tree. 'During the repast, the natives eyed us with intense curiosity, observing our minutest motions, and appearing to discover abundant matter for comment in the most trifling occurrence. Their surprise mounted the highest when we began to remove our uncomfortable garments, which were saturated with rain. They scanned the whiteness of our limbs, and seemed utterly unable to account for the contrast they presented to the swarthy hue of our faces, embrowned by a six months' exposure to the scorching sun of the line. They felt our skin much in the same way that a silk-mercer would handle a remarkably fine piece of satin; and some of them went so far in their investigation as to apply the olfactory organ.' After supper they were regaled with a pipe; and about midnight the group around them gradually dispersed, leaving only those who appeared to be permanent inmates of the house. These individuals now provided them with mats to lie upon; and then extinguishing the tapers that had been burning, threw themselves down to sleep, allowing our adventurers to follow their example. Thus entered they upon their sojourn in the valley of Typee, ignorant whether on the morrow they were to be treated as friends, or served up as a banquet to the cannibal natives.

It was broad day when our hero awoke, and by this time 'the house was nearly filled with young females, fancifully decorated with flowers, who gazed upon me as I rose with faces in which childish delight and curiosity were vividly portrayed. After waking Toby, they seated themselves round us on the mats, and gave full play to that prying inquisitiveness which, time out of mind, has been attributed to the adorable sex. As these unsophisticated young creatures were attended by no jealous duennas, their proceedings were altogether informal, and void of artificial restraint. Long and minute was the investigation with which they honoured us, and so uprorious their mirth, that I felt infinitely sheepish; and Toby was immeasurably outraged at their familiarity. These lively young ladies were at the same time wonderfully polite and humane, fanning aside the insects that occasionally lighted on our brows, presenting us with food, and compassionately regarding me in the midst of my afflictions. But, in spite of all their blandishments, my feelings of propriety were exceedingly shocked, for I could not but consider them as having overstepped the due limits of female decorum. Having diverted themselves to their heart's content, our young visitants at length withdrew, and gave place to successive troops of the other sex, who continued flocking towards the house until near noon; by which time, I have no doubt, the greater part of the inhabitants of the valley had bathed themselves in the light of our benignant countenances!'

Notwithstanding all this distinction, Melville felt ill at ease. The limb which he had injured in descending the ravine began to assume alarming symptoms; and as no medical aid was near, the suspicion crossed his mind that he might remain there a disabled prisoner for life, if indeed the disease might not prove fatal. His companion strove to cheer him. The native doctor exhibited his skill in frictions and emollients, but to little purpose; and for the meantime there was no resource but to submit to be carried hither and thither, as the chief commanded, on the shoulders of a herculean Typee, some six feet three inches in height. In this style he was borne to the stream to bathe, to the chief's residence, to the sacred groves—in fact wherever his curiosity suggested. Though comfortable in every respect, nay, though doted on by the natives, our adventurers had no wish to become adopted Typees, and were consequently plotting their escape. For this purpose it was agreed that Toby should steal across the frontier ridge, pass the Happar valley, and make for Nukuheva, where, telling his tale to the French, he might induce them to send a boat to ransom or rescue his disabled companion. In this attempt, however, he was completely unsuccessful; for even before he had crossed the frontier, a party of straggling Happars fell upon him, and he only escaped by a rapid flight into the valley of Typee, though not before he had received a javelin wound, that disabled him for several days. All hope being cut off in that quarter, they now waited in patience for some boat to touch at the valley to barter with the Typees for fruit, pigs, and water. Such an opportunity at length arrived; but, unfortunately, Melville was still unable to avail himself of it; and Toby left him, under promise of returning in three or four days with help from Nukuheva. Of his companion, however, he was destined never to hear again. Whether he had gone off in the boats of some passing vessel, had reached Nukuheva, and there forgot his promise, or had been massacred by the natives in his attempt to escape, Melville could never learn. The Typees could not by any means be brought to mention the name of Toby; or, if they did, it was vaguely to denounce him as an ungrateful runaway.

But whatever might have been Toby's fate, now that he was gone, the natives multiplied their acts of kindness and attention to Melville; treated him, in fact, with a degree of deference which could hardly have been surpassed had he been some celestial visitant. In spite of all this, he was nevertheless a prisoner: his athletic valet was never from his side; he was guarded and tended with the strictest care; and none of the natives would listen for a moment to any conversation respecting his departure. The cause of all this kindness he was utterly at a loss to discover. Did they regard a white man as a curiosity too valuable to part with, or—horrible thought—did they nurse and nourish him as the future victim of some of their cannibal festivals? Such thoughts he could not altogether repress; and though never uttering the word departure, it was the one thought ever uppermost in his mind. His injured limb being so far recovered that he could walk without support, he now roamed over the valley, attended by his appointed valet, visited every nook and cranny, studied the customs and manners of the natives (to which we shall hereafter allude), conformed himself so far to their ways as to adopt their dress; and even consented to be tattooed; and, if we may judge from his relation, was about to accept a Typee bride, on whose beauty and gentleness he dwells in no measured terms. But though our hero thus revelled in all the enjoyments of Polynesian life, it was enjoyment under restraint. The glorious festivals of the chiefs, the dancings and rejoicings, the love-wanderings with his chosen Fayaway, would have been rejected at any hour for the hail of an English voice, or the sight of a whaler's long-boat. Nor was he destined long to dream of such an occurrence; for one morning the valley was startled from its propriety by the arrival of a native stranger, whose looks, gestures, and words were regarded by the Typees with more than human reverence. This was a tabooed Marquesan from Nukuheva; one who had right

to wander where he chose without molestation, and one whose presence was eagerly sought after by the chiefs, who were anxious to learn the proceedings of the French. 'Marnoo' was his name. He had been taken, when a boy, to Sydney by the captain of a trading vessel, and had, in addition to his other qualities, acquired a smattering of English. From this individual Melville learned what was going on at Nukuheva; and a scheme might have been concocted for our hero's release, had not his anxiety betrayed him; and he and Marnoo were instantly separated by order of the chiefs. Was ever poor adventurer born under a more unlucky star?

Another month had scarcely passed by, when the valley again rang with shouts of 'Marnoo pemi,' and the tabooed stranger once more made his appearance. This time he had come from his native valley of Pueearka; and the thought instantly struck Melville that thither he might escape, and then take his chance of getting to Nukuheva, provided he could enlist the sympathies of Marnoo in his behalf. But 'my heart sunk within me when, in his broken English, he answered me that it could never be effected. "Kannaka no let you go nowhere," he said; "you taboo. Why you no like to stay? Plenty moee-moee (sleep)—plenty ki-ki (eat)—plenty whihenee (young girls). Oh, very good place Typee! Suppose you no like this bay, why you come? You no hear about Typee? All white men afraid Typee, so no white men come." These words distressed me beyond belief; and when I again related to him the circumstances under which I had descended into the valley, and sought to enlist his sympathies in my behalf, by appealing to the bodily misery I endured, he listened to me with impatience, and cut me short by exclaiming passionately—"Me no hear you talk any more; by by Kannaka get mad, kill you and me too. No; you see he no want you to speak to me at all—you see? Ah! by by you no mind—you get well, he kill you, eat you, hang you head up there, like Happar Kannaka. Now, you listen; but no talk any more. By by I go; you see way I go. Ah! then some night Kannaka all moee-moee (sleep); you run away; you come Pueearka. I speak Pueearka Kannaka—he no harm you. Ah! then I take you my canoe Nukuheva, and you no run away ship no more."' So saying, Marnoo left him, and engaged in conversation with the chiefs.

Here, then, was a way of escape for poor Melville; and he instantly set about to accomplish it. But night after night, as he attempted to steal from the house, his ever-watchful valet was in a moment by his side; and his excuses for rising at such untimely hours were as instantly nullified by the objects he sought being placed by his side. His last and only hope was to wait the arrival of some boat in the bay, his determination being, in such an event, to reach the sea at all hazards. He had recently witnessed doings in the valley which made him more uneasy than ever. The men who could revel over the carcase of a Happar, would have little compunction, in case of offence, to do the same with the plumper body of an American. Nearly three weeks had elapsed since the second visit of Marnoo, when one morning the valley was startled by the shouts of, 'Toby has arrived here!' and the reader may well guess of Melville's sensations. Whether it was Toby or not, it was clear a boat was in the bay, to which the crowd was fast hurrying; and, mounting on his valet's shoulders, our adventurer was proceeding seaward with the throng. Mark, however, his disappointment when the chiefs ordered him to stay, and forbade any one to render him assistance, believing that his lameness would prevent his getting to the beach. The crowd still hurrying seaward, left Melville in a great measure to himself; so, seizing a spear, he supported himself as he best could, and made for the bay. When he reached the open space that lay between the groves and the sea, he saw an English whale-boat lying with her bow pointed from the shore, and only a few fathoms from it. She was manned by five islanders, and a sixth, dressed in European clothes, stood on the shore, negotiating with the Typees. This was Karakoee, a tabooed Kannak, whom Melville had often seen on board the Dolly at Nukuheva, and who was treating for his ransom by offering a musket, some bags of powder, and several pieces of calico. The Typees, however, turned from his offers with disgust, and motioned him from their shores, threatening to pierce him with their spears if he advanced another step. Our hero now urged the Kannak in an agony of despair; but he too was seized, and compelled to sit down.

It was clear the Typees were not disposed to part with him. Seeing this—'In despair, and reckless of consequences, I exerted all my strength, and shaking myself free from the grasp of those who held me, I sprung upon my feet, and rushed towards Karakoee. The rash attempt nearly decided my fate; for, fearful that I might slip from them, several of the islanders now raised a simultaneous shout, and pressing upon Karakoee, they menaced him with furious gestures, and actually forced him into the sea. Appalled at their violence, the poor fellow, standing nearly to the waist in the surf, endeavoured to pacify them; but at length, fearful that they would do him some fatal violence, he beckoned to his comrades to pull in at once, and take him into the boat. It was at this agonizing moment, when I thought all hope was ended, that a new contest arose between the two parties who had accompanied me to the shore. Blows were struck, wounds were given, and blood flowed. In the interest excited by the fray, every one had left me except Marheyo, Kory-Kory, and poor dear Fayaway, who clung to me, sobbing indignantly. I saw that now or never was the moment. Clasping my hands together, I looked imploringly at Marheyo, and moved towards the now almost deserted beach. The tears were in the old man's eyes; but neither he nor Kory-Kory attempted to hold me, and I soon reached the Kannak, who had been anxiously watching my movements. The rowers pulled in as near as they dared to the edge of the surf; I gave one parting embrace to Fayaway, who seemed speechless with sorrow, and the next instant I found myself safe in the boat, and Karakoee by my side, who told the rowers at once to give way.'

The danger, however, was not past. The javelins of the Typees were now hurled after them in showers; and as the rowers had to pull against a strong head wind, the boat made so little way, that several of the chiefs stripped, and, with their tomahawks in their teeth, plunged into the water, in hopes of detaining her. 'It was all a trial of strength: our natives pulled till their oars bent again; and the crowd of swimmers shot through the water, despite its roughness, with fearful rapidity. By the time we had reached the headland, the savages were spread right across our course. Our rowers got out their knives, and held them ready between their teeth, and I seized the boat-hook. We were well aware that, if they succeeded in intercepting us, they would practise upon us the manœuvre which has proved so fatal to many a boat's crew in these seas—they would grapple the oars, and, seizing hold of the gunwale, capsize the boat, and then we should be entirely at their mercy. After a few breathless moments, I discerned Mow-Mow. The athletic islander, with his tomahawk between his teeth, was dashing the water before him till it foamed again. He was the nearest to us; and in another instant he would have seized one of the oars. Even at the moment I felt horror at the act I was about to commit; but it was no time for pity or compunction, and, with a true aim, and exerting all my strength, I dashed the boat-hook at him. It struck him just below the throat, and forced him downwards. I had no time to repeat my blow; but I saw him rise to the surface in the wake of the boat, and never shall I forget the ferocious expression of his countenance. Only one other of the savages reached the boat. He seized the gunwale; but the knives of our rowers so mauled his wrists, that he was forced to quit his hold, and the next minute we were past them all, and in

safety. The strong excitement which had thus far kept me up, now left me, and I fell back fainting into the arms of Karakoee.' In the course of the day he was lifted on board the 'Julia,' where, under proper treatment, he speedily recovered the use of his injured limb, and became, we have no doubt, a more steady and enduring seaman.

Such was the adventure of Herman Melville among the most dreaded inhabitants of the Marquesas. The boat which effected his deliverance belonged to an Australian vessel, which, being in distress of men, had put into Nukuheva to recruit her crew. The captain having been informed by Karakoee, who had gained his intelligence from Marnoo, that an American sailor was detained in the neighbouring bay of Typee, supplied suitable articles to offer as ransom, and the generous Kannak immediately undertook the adventure which we have seen end so successfully.

AGE AND REIGN OF MONARCHS.

The causes which affect the health and duration of life of mankind, and the average age at which individuals engaged in various professions die, have been for some time, and are now, exciting considerable attention. The labours of government officers, and others, in preparing statistical tables, &c. have brought to light many results of a curious and instructive kind. Not the least interesting amongst the results of these inquiries, are those which show the average duration of life in various professions, and which prove that all those engaged in pursuits which are attended with much mental excitement and care, do not, as a general rule, live so long as those whose occupations require mere bodily exertion. For example, it has been estimated, by Dr Bellefroid, that the average age at death of those who reach their twenty-eighth year, is, among barristers, 62; physicians, merchants, and farmers, 64; clergymen, 65; poets, 61; artists, 62; professors in universities, 63½; and military officers, 64½. When we consider the very arduous and harassing nature of the duties of monarchs, and the dangers to which, in former times especially, they have been exposed, we will not be surprised to find the average age at death, among such of them as pass their twenty-eighth year, estimated at 56½. It may be interesting to give some details regarding the ages of various monarchs that have ruled in several countries.

Taking the ages of 196 sovereigns, who, from the ninth to the nineteenth century, ruled in Europe and China, it will be found that their average age at death was 50 years, and that of this number only eighteen reached the age of threescore and ten. This is a different result from that quoted above, but it is explained by the fact, that this calculation embraces several kings who never reached their twenty-eighth year. The oldest monarch of the above number was Kien-lung, the grandfather of the present emperor of China, who died in 1798 at the age of 88. The next to him, in point of age, was George III. of Great Britain, who may be called the contemporary of Kien-lung, and whose age, at his death in 1820, was 82. The only other monarch who lived to see his eightieth birthday was Kubla Khan, fourth son of the renowned Jenghis Khan, who ascended the throne of China in the year 1281. The average number of years which each of these 196 monarchs reigned was 23.

In examining the ages of monarchs in the different countries embraced in the above list, we shall find a difference as regards both the age at death and the number of years of each reign. In rude and unsettled times, the average length of a reign is, comparatively speaking, short. For example, it is recorded that, for fifty years during the third century, there were about fifty Roman emperors; and while England was under the dominion of the Anglo-Saxons from 820 to 1017, there were fifteen kings, the average duration of each reign being 13 years. The three Danish princes of England reigned only twenty-seven years altogether, from 1014 to 1041; while the reign of Edward the Confessor, by whom they were immediately succeeded, and who is regarded as among the most distinguished of the Anglo-Saxon sovereigns, extended to a quarter of a century. From the time of the Norman Conquest, in 1066, to the close of the Tudor dynasty in 1603, there were twenty-two monarchs in England, whose average age at death was 49, and each of whom reigned, on an average, 24 years and 5 months. In this number Edward V., who was smothered in the Tower by order of his uncle, the Duke of Gloucester, afterwards Richard III., is not included, he being but a child of twelve years old at his father's death, and regarded nominally as king for only two months and a few days. Of these monarchs only three died under forty years of age. These were Richard II., said to have been murdered after his deposition at the age of 33; Richard III., slain at the battle of Bosworth at the age of 32; and Edward VI., who died in his 17th year. The oldest of these English sovereigns, and the only one whose years numbered threescore and ten, was Elizabeth. She reigned forty-five years; a longer time than any other monarch, with the exception of Henry III. and Edward III., the former of whom reigned fifty-six, and the latter fifty-one years. Besides Elizabeth, the ages of five other monarchs exceeded 60. These were, William the Conqueror, 63; his son, Henry I., 68; Henry III., 65; Edward I., 66; and Edward III., 63. It is worthy of notice that all these princes, with the exception of Henry III., are regarded by historians as eminent for their talents, energy, and skill. Both William the Conqueror, and his son William Rufus, met their deaths by accident—the former by a fall from his horse, the latter by being shot with an arrow in the New Forest.

It is impossible to ascertain from the early history of Scotland the duration of the lives of many of the kings of that country. Twenty-four are said to have reigned from 843 to 1153, which would give an average of about 13 years to each reign. From a statement of the ages of thirteen sovereigns, who ruled from 1153 to 1567—that is, from the time of Malcolm IV. to that of James VI.—it appears that their average age at death was 46, and each reign extended, on an average, over 29 years. Taken in the aggregate, therefore, the sovereigns of Scotland, though younger than those of England, reigned for longer periods. The ages of two of these Scotch kings exceeded 70; namely, William the Lion, who died in 1214, aged 72; and Robert II., who died in 1371, aged 74. All the others, with the exception of Robert Bruce and Alexander II., died at ages under 50.

From the accession of James VI. to the death of William IV., there have been eleven kings of the United Kingdom, whose average age at death was 63, and each of whom reigned on an average 21½ years. With the exception of Charles I. and Queen Anne, none of these sovereigns died under the age of 50; the age of one, George III., exceeded 80, and of George II. and William IV. exceeded 70. The longest reign was that of the third George, which extended to sixty years; and, with the exception of that of his immediate predecessor, all the others were under a quarter of a century in duration; the shortest being that of James II., which only lasted three years, and the next to it that of William IV., who ascended the throne at the advanced age of 67, and reigned only seven years.

From the time of Charlemagne in 800, to that of Louis XVI. in 1792, there have been forty-five kings of France. The ages of forty of these are ascertained; those which are unascertained or doubtful, are all in the end of the ninth or beginning of the tenth century. Of these, only two exceeded the age of threescore and ten; and these are among the most remarkable sovereigns that ever ruled in France. The first was Charlemagne, who may be said to have been the con-

solidator of the French monarchy, and who died at the age of 71, after he had reigned forty-seven years as king of France, and three years as the first emperor of Germany. The second was Louis XIV., whose reign is considered the most brilliant in the annals of France, whose court fascinated all Europe, and under whom the dominion of the French was greatly extended. Louis was sovereign for seventy-two years, and died at the age of 77. Seven of these French kings lived to exceed 60 years of age, and the ages of six were under 30. Of the latter, one was poisoned, and it was suspected that the deaths of other two were brought about by the same means. The ninth Louis, who, after his death, was canonised as a saint, reigned forty-four years, and died at the age of 56 of the plague, off the coast of Tunis, in Northern Africa. The great Henry IV. was assassinated in the thirty-eighth year of his reign, and fifty-sixth of his age; and Charles VII., after having reigned 39, and lived 60 years, died in 1460 from want of food, which he refused to eat, from the fear of being poisoned. The average age of these French kings at death was 52¾, and the average duration of each reign 22 4-5th years.

The history of Spain is a very ravelled skein, in consequence of the country having been at one time divided into a number of separate kingdoms—such as those of Navarre, Aragon, Castile, &c. It is therefore difficult to arrive at any positive conclusion with reference to the ages of the kings who ruled in it. However, from the time of Ferdinand of Aragon, under whom Spain was, in the end of the fifteenth century, consolidated into one monarchy, to the death of Ferdinand VI., in 1759, eight kings ruled, whose average age at death was 55 7-8ths, and each of whose reigns averaged 35½ years. It was during this period that Spain acquired so much strength and importance among the powers of Europe. Under these monarchs she obtained an enormous amount of wealth from her American colonies; and during the reign of one of them, Philip II., she fitted out the so-called 'Invincible Armada.' This king reigned forty-two years, and was the only one among these Spanish monarchs who reached the age of threescore and ten. He was surnamed 'The Prudent;' though it is probable this title was earned *before* his great naval *im*prudence—the unfortunate Armada. His immediate predecessor was the renowned Charles V., who was emperor of Germany as well as king of Spain, and who, surfeited with the splendour of courts and the cares of royalty, retired to a convent, after he had reigned about forty years, and died at the age of 59.

The empire of Russia was under the dominion of the Tartars until the middle of the thirteenth century, when it was freed from their rule by a monarch named Iwan, or John. The dynasty which has now possession of the Russian throne belongs to the family of Romanoff. The first czar of this name was Michael, who was elevated to that dignity when he was only seventeen years old. This prince was taken from a convent to fill the Russian throne at a time when the country was in a distracted state, and when his father, an archbishop, was a prisoner in Poland. He reigned thirty-three years; and from 1610, when he ascended the throne, to 1825, when Alexander died, Russia was governed by eleven monarchs (exclusive of two who died in childhood, and whose reigns did not last a year each), whose average age at death was 44⅓, and each of whom reigned on an average for 21¼ years. In the history of Russia, we find an illustration of a rule that holds good in many other cases—that the longest reign is the most conducive to the consolidation and extension of the power and development of the energy and industry of a country. The longest rule is that of Peter the Great, which extended to forty-three years; this czar dying at the age of 53. None of these Russian sovereigns attained the age of threescore and ten; the oldest was the Empress Catherine, who died at the age of 68, after she had reigned thirty-four years. Elizabeth and Anne, other empresses, died at the respective ages of 52 and 47. The Russian empresses have been longer livers than the emperors; for the average ages of four of the Romanoff line is 51½, while of the emperors it is only 40 3-7th years. Their reigns are, however, shorter; the average being 17, while that of the emperors is 24 years.

The first emperor of Germany was Charlemagne, who, as has been stated, was likewise king of France, and died at the age of 71. The last emperor of Germany was the late Francis II. of Austria, who died in 1835. Between these two sovereigns—that is, between the years 800 and 1835—there have been fifty-three German emperors, thus showing that each reigned, on an average, nearly twenty years. Calculations based on the ages of twenty-nine of these, show that their average age at death was 55¾, and the average duration of their reigns 22½ years. This shows these emperors to have lived as long as the kings of Spain, and to have been exceeded in age only by the kings who reigned in Britain from 1603 to 1837. This is, to a great extent, accounted for by the fact, that nearly all these German emperors were men of experience, and advanced in years, before they obtained the imperial crown. There are only two whose ages at death were under 35: one of these was poisoned in 1001, and the other died of small-pox in 1711.

The kings of Sweden do not appear to have lived to a great age. Of ten monarchs who reigned from 1523 to 1792, the average age at death was 50½, and the average duration of each reign 21½ years. Here again we perceive an instance of the same general rule to which allusion was formerly made; for the longest of these reigns was that of the great Gustavus Vasa, who elevated Sweden to a high position among the nations of Europe, and of whose heroic conduct, both while working in the Dalecarlian mine, and when seated on the Swedish throne, all history speaks in high terms. He died at the age of 70, after a reign of thirty-six years. Another Swedish king who filled all Europe with his fame was Gustavus Adolphus, who was killed at the battle of Lutzen, where he was 'victorious for the last time.' He lived 38, and reigned 22 years. The other great military hero of Sweden, Charles XII., was killed at the siege of Fredericksthall, after he had reigned 22, and lived 36 years. The lives of these two kings show few years, but many actions; and the restless activity of Charles caused his life to be so crowded with deeds, both good and bad, that it may really be said of him, though not quite in Johnson's meaning,

> 'He left a name at which the world grew pale,
> To point a moral, and adorn a tale.'

His successor, Frederick I., formerly Prince of Hesse, was the oldest of these Swedish monarchs. He lived 75, and reigned in Sweden 32 years.

The ages of nineteen sultans, who ruled the Ottoman empire from 1453 to 1789, are ascertained, and show an average of 49, the average duration of each reign having been 17¾ years. Only one of these lived to be threescore and ten. That was Solyman II., who died in 1566. In this list of nineteen are included five Mahomets, the youngest of whom died at the age of 44, after reigning eight years.

The history of the Chinese, as preserved by themselves, is perhaps the most complete record possessed by any nation. It extends as far back as the common date for Noah's flood; and though much is regarded by some as fabulous, still the portion that may be considered authentic embraces a more extensive period than the history of any European nation. The present inquiry will not, however, be assisted by penetrating into the very remote portions of Chinese history: a period of about eight centuries has therefore been selected, from which to ascertain the ages of the emperors. Of thirty-six, who sat on the Chinese throne from 977 to 1795, the average age at death was 46⅝, and the average duration of each reign about twenty years. Of this number six were under 30, sixteen under 40, and nineteen under 50 years of age. In the year 1721,

the emperor Kang-ly completed the sixtieth year of his reign. He was the first Chinese emperor whose rule had lasted so long, and the rejoicings of himself and his subjects on the occasion were very great. His reign, which lasted another year, is the longest recorded in the Chinese annals. He died at the age of 69. His reign was marked by two very important circumstances. The first was the commencement of the trade with Europe in tea; and the second, the introduction among the Chinese, by Father Verbiest, of the art of casting cannon. This Father Verbiest was a missionary of the Jesuits, and rose to be chief mathematician to the Chinese emperor. He was greatly lampooned by many of his brethren in Europe, for putting such powerful instruments of warfare into the hands of the Chinese; but he had the satisfaction of receiving the approval of the high dignitaries of the church for what he had done. The grandson of Kang-ly was Kien-lung, who, on mounting the imperial throne, took a solemn oath that, in the event of the gods permitting him, like his grandfather, to reign for sixty years, he would then show his gratitude for such a distinguished favour by resigning the crown to his heir. A curious vow, which he lived to keep; for in 1795 he abdicated in favour of Keaking, father of the present emperor of China. The reigns of these two emperors, Kang-ly and Kien-lung, extending as they did over a period of nearly a century and a quarter, are perhaps the most important in Chinese history; for in them was first commenced the breaking up of that exclusive nationality which had jealously guarded the Chinese people from intercourse with foreigners, and prevented that interchange of thoughts and commodities which has hitherto proved an efficient promoter of civilisation, and an admirable preserver of peace.

Column for Young People.

SERVANTS.—BY MADAME GUIZOT.

[Monsieur de Bonnel—Augustus, his Son.]

M. de B.—Augustus, I hope you have returned that mask that you took from George, as I desired you?

Augustus (*in a peevish tone*).—I was obliged to return it as you ordered me; but I had not taken it from him—I was giving him what it cost. If George was sulky, and would not take the money, it was not my fault.

M. de B.—He did not want your money, but wished to keep his mask. You had no right to compel him to dispose of it.

Augustus.—I have a very good right to make George do as I choose.

M. de B.—And what gives you that right?

Augustus.—His father, Antoine, is your servant.

M. de B.—And is that a reason why George should have no will of his own?

Augustus.—No; but it is a reason why he should give up to me; and as a proof that he knows he should do so, he always does give up to me. To-day, though, he would not sell me his mask; he had no idea of taking it from me; and only for you, he certainly would have made me keep it.

M. de B.—Well, he will soon think differently, and will hereafter resist your authority.

Augustus.—I should like to see him attempt it.

M. de B.—You shall soon have that satisfaction. Antoine had forbidden his son to use any violence with you, lest he might hurt you. I have just been telling him that if he does not order George to defend himself against you, whenever you torment him, as he would against one of his companions, that he shall come no more here. You will now see whether it is his duty to yield to you in everything, and if it was out of respect to you that he has hitherto done so.

Augustus.—It would be a pretty thing for George to treat me like one of his companions!

M. de B.—You have only to avoid being too familiar with him.

Augustus.—It is not being familiar to wish to make him do what I please.

M. de B.—When you have no right to exact obedience, you can only obtain it by courtesy, by making it a request as you would from an equal, or by force, which he shall be able to repel; and that is the greatest familiarity which I know.

Augustus.—George is intended to be my servant some day—he has told me so a hundred times: he must then be submissive and respectful.

M. de B.—He will not be submissive except in those things in which he shall have agreed to obey you; he will not be respectful but so long as you are not wanting in what is due to him. A servant agrees to obey in everything that regards his master's service, without doing injury to himself. Thus, if a master were to order his servant to go and fight for him, or to give him money out of his savings, the servant would be free to refuse.

Augustus.—People do not require such things as those from a servant.

M. de B.—It is equally foolish and unjust to ask them to work and run about for you, so as to injure themselves, or to oblige them to give up what belongs to them at a price they do not agree to. If you try to compel your servant by force to do what is unsuitable, then he loses his respect for you, and resists as much as he can; and he has a right to do so, for he has only agreed to obey your orders: he has not engaged to expose himself to any other risk, if he disobeys them, than that of being reprimanded or discharged. If you go farther, you break your agreement: abuse, as well as a blow, releases a servant from all duty.

Augustus.—There are, however, servants who continue their duty although they are overworked or ill-treated by their master. I have heard my cousin Armand abuse his groom, and even threaten him with his whip, because he was bleeding a horse badly; and yet Jack continued his work without answering a word, because he knew very well that he must bear it.

M. de B.—What would he have done to Jack if, as his master very well deserved, he had answered him impertinently?

Augustus.—He would have turned him out of doors, and not have given him a character, so that he would not have been able to get another place.

M. de B.—So, then, masters have the power of ill-treating their servants as much as they please; and if every master were to act in this way, all servants would be obliged to bear it?

Augustus.—Of course they would.

M. de B.—But if all servants were to take it into their heads to resist their masters, then the masters would have to bear it, or to do without servants.

Augustus.—That is what can never happen.

M. de B.—It is what would happen were service to become so intolerable that people could not endure it, and consequently had no interest in attending their masters. But masters and servants, being necessary to each other, have found it for their advantage—the one to be kind, the other to be respectful and submissive. It is, then, because there are many good masters, whom it is their interest to serve, that servants are respectful even to bad ones. Therefore he who abuses this respect is a coward, who takes advantage of the goodness of others by sheltering himself behind them, that he may do wrong with impunity.

JUVENILE DELINQUENCY.

At the last Cheshire quarter-sessions, held at Knutsford, Mr Sadler, chief constable of Stockport, made his first of a series of formal reports to Mr Trafford, the chairman of the sessions, on the state of juvenile delinquency in this division of the county, and of the causes inciting thereto. As the subject has now become one of great and absorbing interest, not only with the legislature, but with the public generally, and as the document in question has become to some extent public property, we deem the space devoted to the following rather lengthy extracts by no means uselessly occupied. Mr Sadler commences by observing:—'I have taken from our prison register the names of 280 juveniles, all under the age of 16 years, whose arrests extended over a period of several years, and have made inquiry into their parentage and condition at the time of apprehension, as far as we were able, with the view of ascertaining the causes leading to so much juvenile depravity, and, if possible, of suggesting measures to prevent it. . . . Of these 280, there are 98 of whose circumstances I shall speak particularly. . . . There are 36 who were strangers unknown to our police. . . . and the remaining 134 I shall only allude to by a general observation in con-

clusion. I will commence by observing, as a general summary, that of the 98 juveniles, 36 have been transported, all of whom have been more than once in custody; 32 have been in custody more than once, but not yet transported; and 30 only once in custody. . . . Again, of these 98 juveniles, 6 were orphans, their parents having been dead some years; 3 of these have been transported, and 2 more than once in custody; 13 left without fathers in infancy, 9 of whom have been transported, and 3 more than once in custody; 10 left without mothers, with fathers living, 3 of whom were transported, and 6 more than once in custody; 7 left without mothers, and whose fathers were men of bad character, 2 transported, and 1 more than once in custody; 5 left without fathers, whose mothers were bad characters, 2 transported, and 1 more than once in custody; 8 left without fathers, whose mothers became prostitutes, 2 transported, 5 more than once in custody; 8 whose fathers were felons, 2 transported, and 3 more than once in custody; 4 whose mothers were felons, 3 transported; 4 both parents felons, 1 transported, and 3 more than once in custody; 22 both parents living, but bad characters, 8 of whom have been transported, and 3 more than once in custody; 10 whose fathers were drunkards, mothers creditable, 1 transported, 5 more than once in custody; and 1 whose father was creditable, but mother a drunkard, once in custody. In speaking of character, I include only such parents or guardians as were known to be guilty of drunkenness, or gross immorality, both in language and habits, and leading vagrant, idle lives; many subsisting on the food or money obtained by their children, expressly trained for such purposes. Those known as felons are separately noticed. What portion of the 134 which I have not particularised may have received proper instruction, is not for me to determine.' In another portion of the report, Mr Sadler thus enumerates the causes leading to crime:—Entire absence of proper instruction, attributable to the ignorance or indifference of parents; the influence of bad example, profligate or drunken habits of parents; parents, who from idleness, neglect to provide their families with necessary food; absence of due restraint on the part of parents, regardless of what associations are formed by their children; parents who are themselves vagrants or pedlars (and this is a large class); parents who train their children to habits of mendicancy, and live themselves upon the proceeds; where parents are themselves thieves, and train up their children as such; the seductions or inducements of vicious companionship; children left to their own resources, without parents, home, or shelter of any kind. The remedial measures necessary to counteract these evils, and which are pointed out at length in the report, may be thus summed up:—Moral and religious instruction, and proper family discipline; an alteration of the poor-law, 'so as to meet the condition of such as are not only left without parents, but where neglect or gross profligacy can be proved with regard to parents, by compelling such to support their children in the workhouse;' an improvement of the police system, and of prison discipline, suggesting the principle of separation in the latter case, temporary residence in an asylum or house of refuge, banishment from the country for a term of years in extreme cases—'the present treatment of transports being somewhat mitigated as regards juveniles'—summary commitment, increased rigour in the treatment of adult prisoners. Mr Sadler also states his opinion that the cost of the alterations, means, and appliances necessary to carry out this scheme, would be saved by the diminution in the number of prosecutions, and charge for the maintenance and apprehension of prisoners, which would result from its adoption.—*Manchester Guardian, February* 1846.

LABOUR AND RECREATION.

Recreation is intended to the mind as whetting is to the scythe, to sharpen the edge of it, which otherwise would grow dull and blunt. He, therefore, that spends his whole time in recreation, is ever whetting, never mowing; his grass may grow, and his steed starve: as, contrarily, he that always toils and never recreates, is ever mowing, never whetting; labouring much to little purpose. As good no scythe as no edge. Then only doth the work grow forward, when the scythe is so seasonably and moderately whetted that it may cut, and so cut that it may have the help of sharpening.—*Bishop Hall.*

THE POET.

Amid life's busy hum and clamour hoarse,
Himself though not unseeing, yet unseen,
The Poet still pursues his placid course.
With quiet pace and upturned eye serene,
He looks regretful on the tinsel scene,
The swollen nothings on life's witching stage:
All to his taste is profitless and mean;
Far higher thoughts his towering mind engage—
A fairer, nobler home, a worthier heritage.

For he, while others crawl along life's road,
Scorns the base dust, and soars to fancy's bowers—
Makes, lark-like, in the air his bright abode,
Hath his own world of sunlight, love, and flowers:
Around his heart joys fall in plenteous showers,
And add new vigour to his tireless wing.
While earth-born dullards count the weary hours,
And to their parent dust contented cling,
True to his native heaven, he still doth soar and sing.

Nature and God his animating theme,
The fields his study, and the woods his books,
He seeks the grassy dell and wimpling stream,
And haunts the shadowy groves and rushy brooks;
Even in the meanest things reads happy looks,
Hears joyful utterances in tongueless things,
Finds sweet companionship in loneliest nooks.
How much of Paradise to earth still clings,
Far, far beyond the world's cold dull imaginings!

But ah, he mourns when, though, like princely feast,
Beauty lies spread o'er every hill and plain,
Man still will grovel like the brainless beast,
To Mammon's drudgery bound with iron chain!
Shall Spring put on her beauteous dress in vain,
Nor honoured man, earth's great high-priest, afford
A loving glance at Nature's fair domain?
His only wealth the dross in coffer stored—
Living alone to get, and getting but to hoard?

He grieveth too that man on man should frown,
That creed, condition, country should divide;
That blustering Might should Meekness trample down,
And bloated Wealth o'er Poverty should stride.
How long, how long shall Self be deified,
Imperious Mammon fill his wrongful throne?
By blood and sorrow are not all allied?
Oh that fair Love again would claim his own,
That each might live for all, that all might live as one!

But though for this his bosom grieveth sore,
With hopeful heart he tunes his lofty lay;
Nor deem his words mere figures on the shore,
Which the next tide shall ruthless sweep away:
No; he may die; his words shall not decay,
Nor only live to grace a lady's bower;
But kings and senators shall own their sway.
Great 'mong the greatest is the Poet's power,
He moves the wheels behind, whoe'er may strike the hour

The venerable wrong, the hoar abuse,
The social mischief, the truth-seeming lie—
The ills that fashion, caste, and pride induce—
Full against these his sharpest arrows fly:
And now he lays his unloved thunder by;
And, as the rainbow, smiling fair above,
Embraces, gladdens all that 'neath it sigh,
Persuasion's mightier power he seeks to prove,
And charm a heedless world perchance to truth and love.

S. W. P.

FALSEHOOD.

Falsehood is, indeed, on all accounts inexcusable, and can never proceed but from some unworthy principle—as cowardice, malice, or a total contempt of virtue and honour. The difficulties it runs one into are not to be numbered. One lie requires ten others to support it, and the failure of probability in one of them ruins all. The pains necessary to patch up a plausible story, and the racking of the memory to keep always to the same circumstances in representing things, and avoid contradictions, is insufferable; and, after all, it is a thousand to one but the artifice is detected, and then the unhappy man is questioned as much when he is sincere as when he dissembles; so that he finds himself at a full stop, and can neither gain his ends with mankind by truth nor falsehood.—*Dignity of Human Nature.*

SUSPICION, OR THE LAST APPLE.

The parlour bell rang, and Mrs Bridget hurried up stairs at an unusual rate, for she judged, by the hasty and peculiar tinkle, that she was summoned upon no ordinary occasion. Bridget had lived with Mrs Simpson as maid, or rather as confidant and humble companion, for nearly twenty years. The term humble companion may perhaps have been rather misapplied, as it generally happened that Bridget's opinion took the lead, though the mistress was not always aware of it. It may, however, be justly concluded that, during such a lapse of time, Bridget had become so well acquainted with the temper and habits of the lady, as to understand to a sort of hair's-breadth nicety her mistress's humour by the slightest circumstance. For instance, when Mrs Simpson returned home from an evening party, the quick-sighted Bridget could tell in one moment, by the sound of her footstep, or even, she declared, by the hang of her shawl, whether she had been gratified or otherwise. On the present occasion, therefore, the ringing of the bell indicated something remarkable; and in haste and perturbation Bridget made her appearance to inquire the cause.

'Bridget,' said her mistress in a quiet tone, which did not altogether accord with the hasty summons, nor yet with the agitated looks which accompanied it—'Bridget, come here,' repeated the old lady, who was standing near the window. Bridget obeyed, and looking in the direction to which her mistress pointed, saw, and at once comprehended, why she had been summoned.

'Gracious goodness!' exclaimed Bridget in almost a scream; 'the last apple gone!'

'It is indeed,' replied Mrs Simpson; 'but how is it gone, that's the question?'

'The beautiful apple!' cried Bridget; 'the finest on the tree; indeed the only one that could be said to come to perfection. It was but yesterday morning that I stood admiring it. One side was so sweetly streaked with red, and I said to myself that apple must certainly be ripe, for it had got that fine gold-coloured tinge all over it. Indeed, ma'am, if you recollect, I wished you to gather it some days ago. But, as you say, which way could it have gone? Certainly by no fair means.'

'I think not,' replied Mrs Simpson; 'the weather is so mild and still, that it can hardly have fallen of itself.'

'That I am positive it has not,' cried Bridget. 'If the high wind of last Monday did not bring it down, it could not have dropped since.'

'However,' said the old lady, 'for my own satisfaction, we will just look round the garden.'

'As you please, ma'am, though I feel convinced it will be to no purpose.'

Mrs Simpson and her confidant accordingly set out on the important search; the mistress, with her spectacles on, slowly and carefully peering on either side, and despairingly shaking her head, as every step she took showed the search was useless. Bridget took a less accurate survey as she kicked the fallen leaves about, so thoroughly assured did she feel that the apple had been spirited away. Having thus traversed the whole round of the garden, it was a settled point that the apple was gone to all intents and purposes, and most pathetically did the lady lament that she had not gathered it before; nor did Bridget, in the midst of her condolence on the occasion, fail to remind her mistress that it was about the hundredth time that she had had good reason to repent not taking her (Bridget's) advice. Indeed, though the servant's loss in the apple was equa to that of her mistress, as the favourite fruit was always shared with the favourite maid, yet she had infinitely more of consolation in the business; for there certainly was some satisfaction in the idea of her mistress being punished for not attending to her counsel: and next, having declared her assurance that the apple had gone by unfair means, she was, in truth, not sorry it could not be found.

'Well, ma'am,' said she, 'you see I was right; indeed, from the first moment that it was missed, I felt certain that the apple had been stolen; and now, ma'am, all that remains is, that you will catch your death with cold if we stay out any longer. I can positively affirm that we have sought over every inch of ground; and I once more repeat, that some one must have taken the apple.'

'I am quite of your opinion,' replied the lady; 'and, as you say, there is no good in seeking any further.'

Mistress and maid then directed their steps towards the house, re-entered the parlour, shut the door, and seated themselves by the fire, in order to discuss the subject. The matter of extreme importance now was to ascertain the offender.

'Who can have taken it?' cried Mrs Simpson.

'Why, ma'am,' replied Bridget, 'the truth is, I have but little scruple in saying I firmly believe that Tom Randal, the butcher's boy, is the thief; for, besides that he is one of the most audacious lads I ever knew, he has always cast such a keen look towards that apple-tree, that I often thought it would be next to a miracle if the fruit escaped him. There is something insolent in Tom Randal's whistle. I am positive he is daring enough for anything; and it will only surprise me if that boy does not come to be hanged.'

'I hope not,' exclaimed the charitable mistress. 'Even if he has taken the apple, it is hard to prophesy that he will come to the end you mention. Besides, we cannot speak positively; for though Tom may be saucy at times——'

'May be!' interrupted Bridget; 'indeed, ma'am,

there's no "may" in the matter. He is at all times the most insolent chap that I ever spoke to. It was only yesterday morning that, because I made him go back for the suet, which he had forgotten, he went off muttering. I am sure that I would not for the world wrongfully accuse any one; but I only wish I was as sure of some other things, as I am sure that Randal stole the apple.'

'It may be so,' replied Mrs Simpson; 'but now, Bridget, I will tell you whom I suspect as at least as likely to have taken the apple as the butcher's boy: why, no other person than Jenny Price, the washerwoman's niece. The girl is civil and well-behaved, but yet to me she appears artful.'

Bridget, though generally pretty positive, changed her opinion, and in an instant transferred the guilt from Tom Randal to Jenny Price. She gave her mistress a nod, as much as to say, 'You have hit it!'

'It never struck me before,' cried she; 'but indeed, ma'am, you are right. Jenny is as artful a little puss as ever breathed. I shall never forget, when they had scorched my best lace frill, how cunningly the young gipsy put it underneath the other things, supposing that I should not find it out. I could suspect that girl of any trick. And let me see—she was here late yesterday afternoon, and was dawdling about below for some time; for, after I thought she was gone, to my surprise I saw my young madam creeping out at the gate. Now I say, what business had she to stop an instant after she had been paid? And what could she be doing? But I'll go to her aunt this blessed day, and if I don't make the little demure wretch confess what she has done, my name is not——'

'Stop, Bridget,' exclaimed the old lady; 'we must not be in too great a hurry. Though I mentioned Jenny Price, yet where so many people have been in and out, she is only one among others; besides, I have had another thought. Did not the cheesemonger's lad come here this morning? How can we be certain that he did not take the apple?'

Bridget paused, and looked much concerned. 'I have never seen anything,' said she, 'which could give me reason to suspect him of such a thing. Indeed he seems quite a respectable sort of lad, remarkably well-behaved, and never fails to pull off his hat whenever he meets me. I should be sorry to think any harm of him.'

The circumstance of his politeness very much inclined Mrs Bridget in his favour, especially as she did not in general meet with much civility, being one of those acting managers who take upon themselves infinitely more than their superiors. Mrs Bridget had a notion that the sure way to make herself of consequence, was to find fault and give as much trouble as she possibly could. Consequently, while the shopkeepers, for the sake of profit, bore as patiently as they could with the fault-finding housekeeper, their assistants and she were generally at warfare. The politeness of the cheesemonger's boy was valued accordingly, and it was with some degree of reluctance that she allowed the possibility of his being the culprit. But the longer she considered the matter, the more did circumstances appear against him.

'I am sorry for it,' cried Bridget; 'but, to be sure, boys will be boys; and, upon further consideration, I am sadly afraid it was poor William. He was here very early this morning, ma'am—full two hours before you were up; and as he came along the garden with a basket in his hand, he stopped for a moment close to the apple-tree, and I certainly observed one of the branches shake a little; but I thought nothing about it at the time. So Hannah took in the things, and the lad was going away again, when I recollected that we wanted another lump of butter; and wishing it to be from the same dairy as the last, which was remarkably good, and thinking he would be more likely to attend to my orders than to Hannah's, I ran down stairs and called after him; and, to be sure, I never shall forget how frightened and confused the lad looked. As sure as I sit here, ma'am, he has taken the apple; else why should he have seemed so alarmed? I did not speak angrily; on the contrary, I said, "William, you are a good boy for bringing the eggs in time for our breakfast." So, as I said before, what should make him appear so confused if he had not done something wrong?'

'Well, Bridget,' exclaimed the mistress, 'from all you have said, I certainly think there is little doubt that it was the cheesemonger's lad who took the apple; and really, for a decent well-behaved boy, as you say he is, it was a daring action.'

Bridget made no reply. Though she had given her full evidence against her favourite, yet she seemed pondering over something in her mind.

'After all, as you say, ma'am, it is not right to accuse any one, unless we are quite sure; and I have just recollected another person that neither of us thought of—old Janet Gray. I would not swear that she did not take the apple.'

'Nay, Bridget,' interrupted the lady, 'now your suspicions go too far. I cannot for an instant believe that poor old Janet would do such a thing. You know she only comes now and then for a little skimmed milk or broken victuals, and she has not been here for several days; besides which, I believe her to be as honest a creature as ever lived. What can induce you to suspect the poor old soul?'

'Why, ma'am, you shall hear,' replied Bridget, who had quietly heard her mistress out, aware that she could presently shake her mistress's extreme confidence in Janet's honesty. 'I will just give you my reasons for thinking as I do of the old woman. In the first place, begging your pardon, ma'am, Janet was here no longer ago than yesterday afternoon, and Hannah, by my orders, sent her home with a basketful of different things, even a cold veal cutlet, which I could have eaten myself, for I am very fond of cold veal cutlets; but I said, "Hannah, you may as well give it to the poor old woman;" and this was the return the ungrateful creature made—to carry off our last apple.'

'Well—but,' again remonstrated Mrs Simpson——

'You shall hear, ma'am,' continued Bridget. 'There was a time when I felt a regard for Janet Gray, knowing that she had gone through much trouble, and had seen better days; and there was a time when I thought her as honest as the day, and would have trusted her with untold gold. Indeed so I would now, sooner than with either fruit or cakes; for I do not believe that, upon her own account, she would take a pin: but then Janet has got a grandchild, and, ma'am, you would not credit, nor could anybody believe, the way in which she pampers that brat, and for its sake I firmly think she would beg, borrow, or steal. I remember, times and oft, she has looked at the apple-tree, and sighed; but I thought nothing about it, never supposing that people who wanted bread could long for apples. But the other day I saw old Janet purchasing some coals, and the coals happening to be dearer than she expected, she got

no change out of her sixpence; and so, not having a halfpenny left, she positively intreated the people of the shop, almost with tears in her eyes, to give her an apple or a cake to take home to her dear little Mary.'

'Poor soul!' exclaimed Mrs Simpson in a tone of compassion; 'I cannot think the worse of her for being so fond of her grandchild; nor do I still see, from such a circumstance, that you have any reason to believe that she would steal.'

'Well, ma'am,' replied Bridget, 'perhaps I might not have thought so much about it, but for an artful trick which she served me the other day. Janet had come as usual for her skimmed milk, and hearing her cough very badly, I gave her a large lump of sugar-candy, for which she thanked me most kindly; but—would you believe it, ma'am?—instead of putting it into her mouth, she popped it into her pocket; and I should never have found her out, but that, in her hurry, she slipped it through her pocket-hole, and it fell to the ground. The old woman looked foolish enough, you may be sure, declaring, however, that her cough was nothing, but that, if I pleased, she would take the sugar-candy home to her dear little girl. I own I felt provoked, for I looked upon it as neither more nor less than a cheatery; however, I said nothing; but from that hour I felt convinced that old Janet would go any lengths for the sake of pampering her grandchild.'

'Well, poor creature,' said Mrs Simpson; 'one cannot wonder that she should be so fond of the orphan child of her only son, who was killed in the wars: it is very natural that she should make a pet of it.'

'Very true, ma'am, but there is reason in all things;' and Mrs Bridget argued so forcibly upon the subject, and brought so many instances of the old woman's stratagems to procure niceties for the child, that at length Mrs Simpson felt convinced that she might have been the culprit. There was now a long pause: the thoughts of both mistress and maid were absorbed in the same subject, though in a different way; Mrs Simpson regretting that poor Janet should have forfeited her integrity, while Bridget was casting about in her mind how she should be able to bring the guilt home to the delinquent; that is to say, in what manner she should make the old woman confess the fact.

'I shall be truly sorry,' cried Mrs Simpson, 'if poor Janet has done such a thing.'

'Oh, ma'am!' cried Bridget, 'the more I think of it, the less doubt I have upon the subject.'

The old lady was again silent; for she was still considering if there were no other possible way in which the apple might have gone. At length she said, 'Bridget, did not Mrs Robinson send her maid here yesterday afternoon to inquire after my health? Now, the truth is, I do not like the young woman; and though I would not mention such a circumstance, out of delicacy to my friend, yet I do not think it impossible but that she might take the apple.'

'I never once thought of her,' cried Bridget; 'but, in my opinion, she is about the most likely of all we have guessed at to be the one who has taken the apple; for I never saw that girl, in doors or out of doors, but she was munching something. She seems to be one of those greedy people who are continually eating—her pockets are always filled with nuts, apples, or gingerbread. Now, it being almost dusk when she came yesterday, she might not be aware that the apple she saw was the last on the tree, and that we should immediately miss it. Unluckily, it hung so low, that no one could pass without perceiving it, which was the reason, ma'am, that I wished you to gather it before. So, as I say, you may depend upon it the greedy creature could not refrain from plucking it, and a most barefaced piece of impudence it was; and though it does not become me to differ from you in opinion, ma'am, yet I do think you are over-scrupulous in not liking to mention the circumstance; for a hussy who could not deliver a message without stealing something by the way, ought to be exposed. Indeed it is but common justice that her mistress should be made acquainted with the character she has to deal with; for the more I consider the matter, the more convinced I feel that the girl is quite equal to such an act, and very little scruple should I have in telling her so.'

Which words were scarcely out of Bridget's mouth, ere the subject of them made her appearance. The lady and her confidant exchanged looks, as a well-known saying recurred to the mind of each.

Susan curtsied: she had now brought an invitation from her mistress, and also a request for a book that she had forgotten to ask for the evening before; and while Mrs Simpson went herself to bring the volume, Bridget was considering in what way she should attack Susan upon the subject of the apple; for, notwithstanding her declaration that she should like to tell her of it, she found it rather an awkward affair to directly accuse the young woman of being a thief. But she was spared further deliberation by Susan's leading at once to the subject, exclaiming, as she cast her eyes towards the window, 'Why, gracious me! Mrs Bridget, all your beautiful apples are gone!'

'Yes,' replied Bridget, 'they are *indeed*;' laying a peculiar emphasis on the last word. 'Every one,' continued she; 'and the last apple went in a very remarkable manner;' and Bridget fixed her eyes on the young woman. Susan bore the scrutiny without flinching; but whether from innocence or consummate effrontery, was hard to determine. The housekeeper concluded the latter; but the girl's assurance, though it appeared to add to her guilt, rendered it the more intimidating and difficult to bring her to a confession; when Bridget bethought her of putting a home question, which she imagined must let in some light upon the affair.

'Pray, Susan,' said she, 'did you ever taste our apples?'

'No, ma'am,' replied Susan, and she certainly did blush as she spoke. At this critical moment, however, Mrs Simpson re-entered the room with the book, with which, and compliments and inquiries after the lady's health, Susan was despatched on her return. To have lost such an opportunity was not easily got over by Mrs Bridget.

'Never was anything half so unlucky, ma'am, as your coming in at the instant you did. I was just getting at the truth in the cleverest way imaginable. I merely said, quite coolly, "Pray, Susan, did you ever taste our apples?" and I only wish, ma'am, that you had seen her countenance when I put the question. You would then feel as convinced as I do that she was the person who took the apple; and if I had not brought her to a confession, the apple is not gone—that's all.'

'I am not sorry, however,' replied Mrs Simpson, 'that matters did not go so far. It would have been very awkward to have accused the young woman of such a thing without proof; and you know, Bridget, that circumstances have appeared very strong against every person whom we have thought of, so that we cannot say positively who it was; and I really think, after all, we must let the matter drop.'

Now according to law, persons suspected are considered innocent till their guilt is proved; but Bridget's zeal outstripped her charity, and, far from being puzzled by a circumstance which would have perplexed most people, namely, that among all those accused, only one could have taken the apple, she rather concluded them all guilty till the real culprit was found; and, accordingly, felt very indignant at hearing her mistress talk of letting the matter drop, which, however, in her own mind, she resolved it should not do—not one of the suspected should entirely escape a more rigid scrutiny. Some she resolved openly to accuse, while to others she planned to throw out such broad hints as could not fail to make them understand her meaning; and still, as she canvassed the affair in her imagination, more were added to her list of suspected persons. A family living next door were now brought in: to be sure they were kind neighbours, and of the highest

respectability; but then they had a family of children, and the children had got visitors, and these visitors were schoolboys, who, it is well known, are equal to any pranks in the way of fruit-stealing. This family, therefore, Bridget determined should know a little of her mind upon the subject: but this she kept to herself, aware that her lady would not be willing to risk anything that would be likely to make a difference between herself and her neighbours; so, for the present, the subject was suffered to rest. Except that when Bridget read the newspaper to her lady, she did not fail, in commenting upon the crimes which filled its pages, to dilate upon the mischief ensuing from suffering small offences to go unpunished. The lady bore all these half-reproaches patiently. The circumstance which had occurred still grated on her mind; but the matter had been discussed so warmly, as to threaten unpleasant consequences, arising from some difference of opinion between the lady and her confidential servant. Thus the subject, though occupying the mind of both, was, for the remainder of the day, not mentioned by either.

On the following morning, however, Bridget, having been out on some particular business, entered the parlour with a hasty step, and a countenance glowing with triumph and satisfaction, and began with, 'Well, ma'am, thanks to stirring pretty briskly in the matter, I have at last found out the real thief; ay, ay, let me alone, I generally know how to go to work in such affairs; and now, ma'am, I hope in future you will take what I say a little into consideration. For I repeat, that it is a shocking thing, and a public injury, to suffer thieves to escape with impunity, though it may be only an apple they have stolen.'

'But, Bridget,' said the lady——

Bridget's impatience bore down all interruption. 'I declare, ma'am,' exclaimed she, 'it is enough to try the temper of a saint to hear you with your buts and ifs, when I say that I have got positive proof of the person who took the apple, though I have not yet seen or brought him to confession.'

'And where,' said Mrs Simpson, 'did you or could you get your positive proofs?'

'You shall hear, ma'am,' replied Bridget, unpinning her shawl, and seating herself in regular, comfortable form to begin her story—'you shall——'

'And you shall see, Bridget,' said Mrs Simpson, at the same time taking up the identical apple, the subject of so much debate, suspicion, and false accusation, and which, though it had lain on the table before her eyes, Bridget had been too much occupied to observe.

It is not too much to say that the most terrific apparition would hardly have had a greater effect on Mrs Bridget, who was, to use a vulgar but appropriate expression, completely 'dumbfounded.' When she had somewhat recovered the first shock, for we cannot give it any other term, she endeavoured to doubt the fact, alleging it to be an actual impossibility; but the apple bore a mark, a very remarkable one—a little dint, with a bird-peck on the side of it—which had been too often noticed by both mistress and maid to allow of any doubt. Indeed it seemed like one of those lucky marks which, time out of mind, have served to identify lost children.

In answer to Bridget's looks of wondering curiosity, the old lady went on to relate the circumstance of finding the apple, which was simply this. In taking her customary walk round the garden, by that sort of natural disposition which frequently prompts one to seek, even when all hopes of finding are over, Mrs Simpson, on reaching the apple-tree, cast a look towards the bereaved branch, and from thence to the ground, where, immediately underneath, but nearly concealed by the box-border beneath which it lay, was the lost apple. 'How it happened,' said Mrs Simpson, 'that we missed finding it yesterday, is more than I can imagine; but so it was.'

Bridget sighed, wondered, and once more examined the apple, to see if she could find a flaw in the evidence; but it was not to be done: the only flaw was in the apple, which had been most cruelly tunnelled and honeycombed by the insects.

'Ah, Bridget,' said the old lady, 'how many innocent people have we accused, and never once suspected the real depredators—the slugs and snails! I hope, for the future, we shall know better: indeed it is a true saying, that "the loser is often the greatest sinner." I am very glad, however, that we went no further than talking the matter over between ourselves, as it might otherwise have led to unpleasant consequences.'

Bridget's conscience in this respect was not quite so clear as that of her mistress; but she was thoroughly humbled, and we trust she received a *beneficial lesson*.

ANIMAL LANGUAGE.

Language—as far as the communication of ideas by certain modes of contact, by gesture, or by sounds, can be called by that name—seems to be possessed in common by all living creatures. The first or simplest form in which this faculty is manifested among animals, is that of contact—a species of intercommunication beautifully illustrated by the habits of such insects as the ant. 'If you scatter,' say the authors of the *Introduction to Entomology*, 'the ruins of an ant's nest in your apartment, you will be furnished with a proof of their language. The ants will take a thousand different paths, each going by itself, to increase the chance of discovery; they will meet and cross each other in all directions, and perhaps will wander long before they can find a spot convenient for their reunion. No sooner does any one discover a little chink in the floor, through which it can pass below, than it returns to its companions, and, by means of certain motions of its antennæ, makes some of them comprehend what route they are to pursue to find it, sometimes even accompanying them to the spot; these, in their turn, become the guides of others, till all know which way to direct their steps.' The mode of communication employed by bees, beetles, and other insects, is much of the same nature, being almost entirely confined to contact, and rarely or ever partaking of gesticulation, which may be considered as the next form of language in the ascending scale.

In expressing their wants, feelings, and passions, almost all the higher animals make use of gesticulation. The dog speaks with his eye and ear as significantly as he does by his voice; the wagging of his tail is quite as expressive as the shake of a human hand; and no pantomime could better illustrate conscious error, shame, or disgrace, than his hanging ears, downcast look, and tail depressed, as he slinks away under rebuke. The dog, indeed, is an admirable physioguomist, whether actively or passively considered. If you can read craving, fear, or anger in his countenance, so he will kindness or surliness in yours, just as readily as he can interpret the physiognomy of one of his own species. Observe that huge mastiff gnawing a bone on the other side of the street, and see how the Newfoundland that is coming up on this side deports himself. First, he stands stock-still; not a muscle of his frame is moved: the mastiff takes no notice of him. Next, he advances a few steps, looks intently, wags his tail once or twice; still not a glance from the mastiff, which is evidently striving not to observe him. On the Newfoundland goes, with an indifferent amble, keeping as closely to this side as he can, and thinks no more of the mastiff. Had the latter, however, lifted his head from the bone, had he exchanged one glance of recognition, had he brushed his tail even once along the pavement, the Newfoundland would have gone gambolling up to him, even though the two might have had a tussle about the bone in the long-run. Here, then, is an example of strict physiognomy or pantomime, quite as well understood between animals as the most ardently-expressed sounds. Again, mark that couple of terriers, bound on a secret rabbiting excursion to yonder hill-side. Two minutes

ago, that shaggy native of Skye was dozing on his haunches, as little dreaming of a rabbit-hunt as of a journey to the antipodes. But his little pepper-and-mustard friend awoke him from his reverie, and pricking up his ears, gambolled significantly around him. Next he scampered onwards for a dozen of yards or so, looked anxiously back, again scampered forward, looked back, whined, and returned. Then he set out, scenting the ground as if he had made some important discovery, stopped suddenly, made a short detour, tracking some imaginary scent as eagerly as if a treasure of venison lay beneath his nose. This at length rouses his friend of Skye, and away they trot as slyly to the hill as any couple of poachers. Now our pepper-and-mustard hero is beating the whin-bushes, while his comrade stands outside the cover, ready to pounce on the first rabbit that makes its appearance. Not a whine, not a yelp is heard—the whole is conducted by signs as significant and as well understood as the most ingenious system of marine signalising.

Independent of the humble kind of expression which gesticulation implies, many of the higher animals are possessed of vocal language, by which they can give the most intelligible utterance to their feelings of delight, pain, fear, alarm, recognition, affection, and the like. Nor does this language differ in aught but degree from that which we ourselves enjoy. Our organs may be capable of a greater variety of tones and modulations; and yet in some cases this is more than questionable: all that can be said is, that the human organisation is capable of more perfect articulation, and this articulation is a thing of art, imitation, and experience, depending upon the higher degree of intelligence with which the Creator has endowed us. The brute creation express their feelings and passions by certain sounds, which are intelligible not only to those of their own species, but in a great degree to all other animals. Man, in his natural state, does little or nothing more. It is civilisation—the memory of many experiences, aided by his higher mental qualities—which gives him his spoken language; each new object receiving a name founded on association with previously-known objects, and each conception receiving expression by association with ideas formerly entertained. Nothing of this kind takes place among animals; their limited endowments do not permit of it, as the range of their existence does not require it. Their language may be considered as stationary in a natural state, though capable of some curious modifications under human training, or even under certain peculiar changes of natural condition. It is to this range of animal expression that we would now direct attention.

Take that barn-yard cock, for example, which five minutes ago was crowing defiance from the top of the paling to his rival over the way, and hear him now crowing a very different note of delight and affection to his assembled dames. In a few minutes you may hear his peculiar 'cluck, cluck,' over some tid-bit he has discovered, and to which he wishes to direct their attention; his long-suppressed guttural cry of alarm, if the mastiff happens to be prowling in the neighbourhood; or his soft blurr of courtship, when wooing the affections of some particular female. All of these notes, even to the minutest modulation, are known to the tenants of the barn-yard, which invariably interpret them in the sense they were intended. Or take the barn-yard hen, and observe the language by which she communicates with her young. By one note she collects and entices them under her wings, by another calls them to partake of some insect or grain she has discovered, by a third warns them of danger, should any bird of prey be sailing above, by a fourth calls them away to another place, or leads them home, should they have strayed to a distance. Nor are these various calls known instinctively, as is generally believed, by the young brood. We have watched the habits of the barn-fowl with the closest scrutiny, and are convinced that a knowledge of the mother's notes is, to the young, a process of acquirement; in the same manner as a human child quickly, but nevertheless by degrees, learns to comprehend tones of affection, doting, chiding, and the like. The knowledge of the lower animals is in almost every instance acquired; a process necessarily more rapid in them than in man, as they much sooner reach the limit of their growth and perfection. Animal language is most perfect and varied among such animals as are gregarious in their habits. Let the most ignorant of natural history attend for a few days to the habits of a flock of birds, a herd of oxen, horses, deer, elephants, or the like, and he will find that they make use of a variety of sounds often totally different from each other. Friendly recognition, hatred, fear, mirth, satisfaction, the discovery of food, hunger, and so on, are expressed each by a peculiar note, which is distinctly and instantly comprehended by the whole flock. And as among men, when simple sounds are insufficient, so among animals gesticulation is made use of to assist the comprehension and deepen the impression.

If, then, animals are really in possession of a vocal language, it may be asked, is that language capable of any modification, improvement, or deterioration; and have we any evidence to that effect? That animal language admits of extensive modification, we have ample proof in the history of cage and singing-birds. The natural note of the canary is clear, loud, and rather harsh; by careful training, and breeding from approved specimens, that note can be rendered clear, full, and mellow as that of the finest instrument. We have farther proof of such modification, in the fact of a young canary being made to imitate the notes of the linnet or goldfinch, just as either of these may be taught the song of the canary. The starling and blackbird may be trained to forsake their wood-notes wild, and to imitate the human whistle to perfection in many of our national melodies. Nay, the parrot, starling, raven, and even the canary, may be taught to articulate certain words and phrases with more precision and emphasis than the tyros of the elocutionist. Nor is artificial training always necessary to accomplish such modification; for we have the gay and lively mocking-bird of America producing, of his own free-will, almost every modulation, from the clear mellow tones of the wood-thrush, to the savage scream of the bald eagle. 'While thus exerting himself,' says Wilson, 'a person destitute of sight would suppose that the whole feathered tribes had assembled together on a trial of skill, each striving to produce his utmost effect, so perfect are his imitations. He many times deceives the sportsman, and sends him in search of birds that perhaps are not within miles of him, but whose notes he exactly imitates: even birds themselves are frequently imposed on by this admirable mimic, and are decoyed by the fancied calls of their mates, or dive with precipitation into the depth of thickets at the scream of what they suppose to be the sparrow-hawk. The mocking-bird loses little of the power and energy of his song by confinement. In his domesticated state, when he commences his career of song, it is impossible to stand by uninterested. He whistles for the dog—Cæsar starts up, wags his tail, and runs to meet his master; he squeaks out like a hurt chicken—and the hen hurries about with hanging wings and bristling feathers, clucking to protect her injured brood. The barking of the dog, the mewing of the cat, the creaking of a passing wheelbarrow, follow with great truth and rapidity. He repeats the tune taught him by his master, though of considerable length, fully and faithfully. He runs over the quivering of the canary, and the clear whistlings of the Virginian nightingale or redbird, with such superior execution and effect, that the mortified songsters feel their own inferiority, and become altogether silent, while he seems to triumph in their defeat by redoubling his exertions.'

As there is thus an evident capability of modification, so there must, to a certain degree, be improvement or deterioration, as surrounding circumstances are favourable or unfavourable to the development of the vocal

powers. A young canary brought up in the same room with a goldfinch and linnet, if he does not slavishly adopt the notes of either, will often be found to add them to his own natural music. The natural voice of the dog, so far as that can be ascertained from wild species of the family, is more a yelp and snarl than a bark; and yet what is more full and sonorous than the voice of the Newfoundland or mastiff? The wild horse —depending so much as it does upon the society of its kind—acquires the nicest modulations of neighing, so as to express pleasure, fear, recognition, the discovery of pasture, and so forth; while the laboured hack has scarcely, if at all, the command of its vocal organs. The voice of animals is just as evidently strengthened and increased in variety of tone by practice, as is that of the human singer or orator, and thus becomes capable of expressing a wider range of ideas. Indeed it is certain that, if animals are placed in situations where the use of their language is not required, they will in a short time lose the faculty of speech altogether. Thus, on the coral island of Juan de Nova, where dogs have been left from time to time, and where, finding abundance of food, they have multiplied prodigiously, it is asserted that the breed have entirely lost the faculty of barking. We knew an instance of a young canary, just bursting into song, which was rendered permanently dumb by being shut up in a darkened chamber, and by occasionally having a cloth thrown over its cage, that its notes might not disturb an invalid. This treatment was continued for several months; and so effectually did it destroy the clear, brilliant notes of the youngster, that he was never afterwards known to utter a note beyond a simple 'tweet, tweet' of alarm. As the human speech is affected by disease and old age, so likewise is that of the lower animals. The husky, paralytic voice of the old shepherd-dog, is a very different thing from the full-toned bark of his athletic years; formerly, its modulations could give expression to joy, fear, anger, reproach, and the like; now, its monotony is destitute of all meaning. We were once in possession of a starling, which we had taught to utter a number of phrases, and to whistle in perfection a couple of Scottish melodies. After a severe moulting attack, not only was his power of voice destroyed, but his memory apparently so much affected, that phrases and melodies were ever after jumbled incoherently together; much like the chattering of an old man in his dotage, or like those individuals who, after severe fevers, forget some of the languages they have acquired, or make themselves intelligible through a new jargon of English, French, and Latin phrases.

But it may be asked—if the lower animals thus make use of a vocal language, are those to whom it is addressed at all times capable of interpreting its meaning? The well-known habits of gregarious animals, in our opinion, ought to answer this question. Every individual in a herd of wild horses or deer, most perfectly understands every gesture and sound of the watch or leader, which is stationed for the general safety. Nor is such understanding altogether instinctive, but a process of training and tuition quite analogous to what takes place in our own case. Farther, the speech, if we may so call it, of one animal is not only understood by the animals of its own class, but in a great measure by the other animals that are in the habit of frequenting the same localities. Thus the chaffinch, which discovers the sparrow-hawk sailing above, instantly utters a note of alarm—a note known not only to other chaffinches, but understood and acted upon by all others of the feathered race within hearing. The suspension of every song, the rustling into the thicket beneath, the sly cowering into the first recess, or the clamour of impotent rage, abundantly attests how well they have interpreted the original note of alarm. But if all other evidence were wanting of the capacity of the lower animals to interpret other voices than their own, the fact that many of them learn to interpret human words, and to distinguish human voices, would be sufficient attestation. Thus the young horse taken from the hills, learns in a few months to discriminate the words spoken to him by his driver; and so do the ox, the dog, and other domesticated animals. This comprehension of vocal sounds evidently implies a sense of language—a sense that, on their part also, the expression of certain sounds will meet with a certain interpretation.

Such is the language of the lower animals: limited, no doubt, when compared with that of the human race; yet all-sufficient for their wants, and only inferior because not combined with that higher intelligence which, after all, forms the true distinction between man and his fellows of the animal creation.

BIOGRAPHIC SKETCHES.

MURILLO.

Bartolomé Esteban Murillo, the eminent Spanish painter, was born at Seville on the 1st of January 1618. His genius was displayed at a very early age, for little Bartolomé was in the habit of blackening the white-washed walls of the rooms in his father's house with his sketches, and scratching figures on the brick floors. It was the wish of his parents that he should be educated for the church; but the boy evinced so strong a predilection for the art in which he afterwards so brilliantly distinguished himself, that they at length yielded to his intreaties, and placed him with his uncle, Juan del Castillo, a painter of some repute, especially in the art of colouring.

The subjects in which Castillo excelled were fairs and markets, which afford such varied materials for picturesque groups. Murillo painted several pictures in that style, and his preceptor took great delight in encouraging him. The result was, that in a few years the disciple had learned almost as much as his master was able to teach.

At this epoch, Castillo having suddenly broken up his school, and quitted Seville to reside at Cadiz, Murillo was thrown upon his own resources, and, instead of entering any of the other schools which had rivalled Castillo's academy, he followed the impulse of his genius, and struck out a path for himself. Collecting the implements of his art, he hastened to the fair, which was then being held at Seville. It was the custom for very inferior artists to post themselves in the fair, and execute orders on the spot, for portraits of saints and martyrs, and other devotional subjects, for the adornment of dwellings, or to be exported to the then extensive Spanish colonies. Murillo, though he must have been aware of his own superiority to the class by whom he was surrounded, did not hesitate to become a candidate for employment, and performed cheerfully whatever work was offered to him, without bargaining as to price. This apparently disadvantageous commencement was perhaps one of the main causes of his subsequent success, inasmuch as he was obliged to work so rapidly, and his subjects were so varied, that he at once attained a remarkable freedom of touch and readiness of expression.

When Murillo was in his twenty-third year, one of his brother pupils at Juan del Castillo's, named Pedro de Moya, and of whom he had lost sight for several years, returned to Seville from Flanders, where he had enjoyed the advantage of studying his art under the celebrated Vandyck. The progress made by his former companion, as evinced by the specimens he displayed, stimulated Murillo to endeavour to avail himself of similar opportunities of improvement; but his resources were insufficient to defray the cost of foreign travel. Seville did not supply a field for increasing his means; but the idea struck him, that he might profitably dispose of the productions of his pencil to the masters of vessels trading from Cadiz to South America. Accordingly, he purchased a large piece of canvas, and having been well-grounded by his master, Juan del Castillo, in the method of preparing or priming it, he performed that

operation himself — thereby economising much — and then, cutting it into unequal parts, he painted upon the greater portion of them Scriptural subjects, and portraits of saints, and on the remainder landscapes, animals, and flowers. He then hastened to Cadiz, where he found no difficulty in disposing of his pictures; and returning to Seville with their product in his purse, he remained there only a sufficient time to acquaint his brother with his intention to travel, and then wended his way on foot, with an anxious, yet hopeful heart, towards Madrid. He was now twenty-four years of age.

On his arrival at the Spanish metropolis, he introduced himself to Velasquez, chief painter to Philip IV., who was highly esteemed not only at court, but universally, as an artist of transcendent merit, and a good and high-minded man. Velasquez received Murillo with the kindness which was natural to him; and having heard his simple history, he entered warmly into his feelings, and insisted that he should become his guest. In the palace, galleries, and collections of Madrid, and at the Escurial, Murillo beheld, for the first time, some of the most celebrated works of the great Italian and other masters: the delight of the young artist may be easily conceived. His generous patron, Velasquez, obtained for him every facility for copying those valuable models; and during the three years of his residence in Madrid, he manifested his great artistical powers. Velasquez watched the remarkable progress of the youth with the greatest interest, and brought under the king's notice copies made by the latter from three pictures —one by Vandyck, another by Rubens, and a third by himself. They were greatly admired by the sovereign and his court; and Velasquez strongly recommended Murillo to go to Rome, proposing not only to give him letters of introduction to eminent individuals in that city, but offering him the pecuniary means of accomplishing the journey, and of residing at Rome commodiously. These generous proposals were, however, declined; no doubt Murillo felt unwilling farther to avail himself of the bounty of Velasquez, and, impressed with gratitude for the invaluable protection and friendship of his disinterested patron, he took an affectionate leave of him, and returned to Seville.

Among other reasons which it has been supposed weighed with Murillo in producing this fixed resolution to return to his native city, without fulfilling his original intention of visiting Italy and other countries, there is one which appears to have been very natural; namely, that, having had access in Madrid to a number of the works of the first masters of every school, and having enjoyed the advantage of studying and copying them under the eye and with the advice of Velasquez, he felt that the object of his departure from Seville had been attained, and was drawn towards the place of his birth by the desire to enrich it with the productions of his genius.

The first employment he obtained after his arrival at Seville, was to paint eleven historical pictures for the *claustro-chico*, or smaller cloister of the Franciscan convent. He was not, however, engaged by the friars to paint those pictures because they considered him to be superior to the other artists resident in Seville, but, on the contrary, in consequence of the backwardness of those painters to accept the very moderate sum at the disposal of the community. Murillo being applied to as an artist of inferior grade, consented to paint the pictures on the proffered terms. They were so admirably executed, that they became the theme of universal praise. The author's fame soon eclipsed that of all the other painters in Seville, and he was overwhelmed with orders for pictures.

This was indeed a triumph; nor did his good fortune stop here. Having occasion to undertake a journey to a small place at a short distance from Seville, called Pilas, the birthplace of his mother, from whom he had inherited some little property, he there saw Donna Biatriz de Cabrera y Sotomayor, a lady of great beauty, and not only gifted with superior qualities of mind and disposition, but possessing a considerable fortune. Murillo became enamoured of this lady; but his diffidence, which was exceeded only by his merit, restrained him from aspiring to an alliance with one whose rank in life was so superior to his own. It is related, however, that, having been requested to paint an altar-piece for the church of San Geronimo at Pilas, he made so exact and beautiful a portrait of Donna Biatriz, in the countenance of an angel, that the lady, on being informed thereof, bestowed her affections on the painter, who had thus proved his attachment to her; and they were shortly afterwards married. This happy event was but the prelude to the astonishing success which attended Murillo's future career. Seville became adorned with the productions of his pencil; and it is worthy of record, that the highest price he received for any picture was 15,975 reals, or about L.160, for the justly celebrated picture of the miracle of the loaves and fishes, painted for the hospital of La Caridad at Seville; whilst for an almost equally prized painting, formerly in the Franciscan monastery, he was only paid 2500 reals, or L.25. For the great picture of San Antonio de Padua, for the baptismal altar of the cathedral of Seville, he received 10,000 reals, or L.100 sterling.

Eleven years after his return to Seville—that is to say, in 1658—Murillo formed the project of establishing an academy of painting in his native city. He met with much opposition from Herrera, and other artists, who had studied in Italy, and who were unwilling to support an artist who had never quitted Spain, as the founder of a school of painting. But his genius and perseverance vanquished every obstacle, and on the 1st of January 1660 the academy was opened, Murillo being its first president, though, with the modesty and generosity by which he was ever distinguished, he placed the name of Herrera—who had yielded to the force of his reasonings—at the head of the list of the members of the academy.

Murillo's fame may be considered to have reached its height between the years 1670 and 1680, during which period he painted his celebrated pictures of the prodigal son; our Saviour miraculously feeding the five thousand, in which there are a great number of figures in a variety of groups and attitudes, and which is remarkable for the beauty and mellowness of the colouring; Moses striking the rock; and St Thomas distributing alms to the poor. Murillo is said to have preferred the latter to all his other works. His grand picture of Moses striking the rock, displays, with great power, the varied sensations of the multitude. Some are full of anxiety for the fulfilment of the hoped-for miracle, crowds of Israelites are seen rushing towards the rock in order to assuage their thirst, whilst the exercise of Divine power is conspicuously manifested in the flow of water from the rock.

It was about this period, too, that he painted for the Hospital de la Caridad, at Seville, the admirable picture of Santa Isabel, queen of Portugal, visiting the sick and infirm poor: it is now in the collection of the Royal Academy of San Fernando at Madrid. Nothing can be more touching than this picture. The eye rests with delight upon the figure of the pious and youthful queen, who is personally performing the charitable office of attending to a youth afflicted with the loathsome distemper called a scald-head. Her beautiful countenance seems illumined by the most tender and benevolent emotions, whilst with gentle care she squeezes some water upon the boy's head from a sponge which she holds in her hand. One of her ladies holds a silver basin, in which the water is contained, whilst the mother of the youth looks up with anxiety, mingled with confidence and gratitude, towards the benevolent princess. There are several other figures in the picture, all in harmony with a subject wherein human suffering appears to be softened and allayed by the presence, tenderness, and practical Christian charity of the royal visitant. This beautiful composition rivets

the attention of the beholder, and leaves a lasting impression on the mind.

But our limits will not admit of an attempt to enumerate the works of this celebrated and truly original Spanish painter. His Scriptural pieces, which he painted in great numbers, are universally and justly admired; they are to be found in the best collections both in Spain and other countries. Notwithstanding the vicissitudes which Spain has undergone, and the number of valuable paintings of all the masters which were abstracted from that country in various ways in the course of the wars by which it has unhappily been afflicted, the far greater proportion of Murillo's pictures still adorn the public galleries, churches, and private collections of his native country.

Murillo was commissioned by Philip IV., king of Spain, to paint several historical subjects: those pictures were highly esteemed; and having been afterwards sent to Rome as presents from his majesty to the pope, the Italians were so much struck with their excellence, that they gave Murillo the title of the second Paul Veronese. The altar-pieces of many of the convents and churches of Madrid, Seville, Cordova, Granada, and Cadiz, were painted by Murillo; and even some of those of Flanders were sent thither from Spain. His portraits and landscapes are also excellent. Although Murillo was so highly distinguished as a painter of Scriptural and historical subjects, his talent in another branch of the art was extraordinary, and peculiar to himself, and has justly added to his celebrity. His portraits and groups of Spanish peasant and beggar boys, drawn after nature in a variety of attitudes and actions, such as playing at games, &c. are so truly characteristic, that all who have visited Spain, down to the present day, are struck with their identity. A gentleman who had resided some years in the peninsula, on visiting a gallery where there was one of these groups by Murillo, exclaimed to a friend by whom he was accompanied when the picture caught his eye, 'I have seen those boys, those very boys, in Spain!' So true to life and nature was Murillo.

Numerous copies of his pictures have been disposed of to foreigners as originals, though many of the latter are to be found in private and other collections in England, France, and other countries. In the National Gallery in London there are three of Murillo's paintings —a holy family; St John, when a child; and a Spanish peasant boy. They are well worthy of contemplation.

Murillo's disposition—which was characterised by gentleness, benevolence, and all the attributes of a sincere and practical Christian—exercised no doubt a great and softening influence over his choice of subjects for the exercise of the art in which he gained such high renown; and it is worthy of record, that such was the elasticity of his virtuous mind, that instead of being vain of the praises he received, they only stimulated him to increase his efforts to attain perfection. Even when compared with the great Italian masters, this eminent Spanish painter stands unsurpassed. He was peculiarly happy in drawing women and children. His style is graceful, the composition of his pictures well-studied, the attitudes of his figures varied and correct, their expression natural and attractive, the draperies elegant. All the subjects he made choice of, though brought forward with great skill, have a character of beautiful simplicity. His colouring is soft and harmonious, uniting the brilliancy of the Flemish with the correctness of the Venetian school; and the more his paintings are studied, the more conspicuous does their merit become.

Towards the close of the year 1681, Murillo, whilst painting an altar-piece for the chapel of the Capuchin convent at Cadiz, fell from the scaffolding, and was so seriously hurt, that he was obliged to return to Seville, where, after intense suffering, he breathed his last on the 3d of April 1682, in the arms of his friend and pupil, Don Pedro Nunez de Villavicencio. His wife had died about twelve years previously, and beyond the fortune she brought him, his property was small. He bequeathed the whole to his sons.

Among the pictures enumerated in his will, there was a portrait of himself when about thirty years of age, which was also the period when his marriage took place. It conveys a most pleasing impression of the amiable and gifted characteristics of the original.

OCCASIONAL NOTES.

DROMIO PUBLICATIONS.

The withering ridicule bestowed by Horace upon literary imitators in his one emphatic appellative, 'servile herd,' has been repeated times without number, and the veriest tyro is now aware that theirs is, of all the sins of composition, the greatest. But since Horace's time, an entirely new kind of literary imitation has come upon the field, one in which publishers are primarily, and in general authors only secondarily, concerned. It consists in the presentment of works in direct imitation of others which, whether from their originality and merit, or from their aptly subserving some public need, have met with success. The writings of Swift and Pope tell us of a branch of 'the trade' devoted to this business early in the last century, with Edward Curl for its most eminent professor. But it has, in our time, reached a magnitude, compared with which its early history is as mewling infancy to a Hercules's manhood. It is now absolutely impossible for the slightest originality to be shown in any of the forms of paper and print, but it is immediately run upon by scores of the bibliopolic pecus, and tossed and gored into a thousand deformations.

There is a vast number of grades in this imitative power—altogether apart, it must be understood, from respectable efforts in the line of fair competition—from him who can get up a similative novel or periodical, down to the poor serf who limits his efforts to the counterfeiting of a clever book-cover. It is, however, all one thing in its ultimate character—an effort to come in for a share of the benefits which some wits of a happier kind are supposed to derive from their originality. One cannot but be somewhat amused in contemplating the proceedings of these dullards. Their private ratiocinations are of course simple enough: 'There are Smart and Spritely—understood to make a capital thing by that magazine of theirs; can't we get up something of the same kind, and take a share of their profits?' Here is the real principle of action; but of course the public must be told something else. A prospectus accordingly deplores the absence of a certain desirable character in all existing periodicals. They are too utilitarian, and do not address themselves sufficiently to the feelings; or perhaps they are too sentimental, and do not condescend sufficiently to the affairs of common life. Anything will do that may serve to mask the real object—that of draining away a portion of the patronage bestowed upon Smart and Spritely. Sometimes even a tone of censure is assumed towards the parent works. They are misleading guides: much need has the poor public to be rescued from them. Here is the pure and clean tuber at last! An instance could actually be shown of this kind of swagger being assumed, where the extreme meanness had been descended to of stealing part of the name, as well as imitating the form, of the work rivalled. What an odd idea—pretending to a superior virtue over the publication for which it was willing to be mistaken! But such is the nature of the herd in general. Capable of the sneakery of a direct imitation, they seem to be capable of any inconsistency in working it out. Hence all the progeny of successful works are more or less parricidal in their tone. The parent is astonished to find twenty images of himself putting on a hostile frown against him, and that faults and failings in his character, which the world never could see, are at length detected and exposed by his own children.

To achieve an end with that unfortunate polypoid

animal, the public, is of course the real intention of these breaches of the fifth commandment. The public, to do it justice, means well, and dreams not of evil. But this just the more lays it open to be practised upon by the fraternity of imitators. The public wishes to be shaved; it has heard of a clever artist in that line near the Blue Posts; it seeks the shop according to a description it has got, and blunders into one of four exactly imitative barbers' tabernacles which have been got up by the side of the meritorious original. The public has heard of an amazingly clever cork-screw, which whips corks out of bottles as it were by magic, and it goes to provide itself with the admirable instrument: it does not get the genuine screw, but one made by a man with a similar name, and who, being a numskull, gives his wares only an appearance, but not the reality, of their pretended virtues. Again, the public is anxious to get a certain pill, in which it has been taught, from its youth up, to place reliance: it sends for a three-shillings-and-sixpence box, and is supplied with a base imitation, loudly proclaiming on its cover, 'Be sure to ask for the true-blue antibilious pill, prepared by —— ——.' Thus is the public imposed upon in literature also. To every favourite work which it may desire, it has to make its way through an entangling brushwood of similative works, all pretending to be the true work in the first place; and in the second, if the first trick fail, to be better. Every now and then its attention is attracted by a prospectus which will not be overlooked; for go where the public will, there is the portentous announcement. Well, the public reads the advertisement, and (we shall suppose the thing referred to is a newspaper) not being behind the scenes in such matters, it yields a kind of credence to the tale which it is told—as to interests of its own to be advanced, and so forth. It purchases; it reads; half-recollecting all the time that there were very tolerable publications of that kind before, even to the minutest specialty of character; rather hazy, however, about the fact; always looking for the outcome of the great promise—when is the fun to begin? Why, after all, the old work was just as good, or rather better. What is the meaning of all this? Only, dear public, that a certain worthy person, who could not start an idea of his own, got up behind another man's idea, and tried all he could to oust him from the possession of his own vehicle. There is nothing else in the whole matter. But only thou, silly public that thou art, couldst never see it.

It is melancholy, too, this desperate struggle to get bread reft from each other's mouths. It is not all slavish meanness of soul. Often there is ingenuity of no inconsiderable amount expended in getting up a passable imitative work. Often wonderful sacrifices of capital and labour are made to thrust the secondary work into the saddle of its primary. It was lately stated that an imitative weekly newspaper had caused an outlay of twenty thousand pounds, the return of which was one of the remotest of contingencies. What heroisms these are in their way!—perverted, misapplied, yet still heroisms—elements in what might, associated with purer elements than acquisitiveness for self and partners, constitute great characters. One could almost weep over human nature thrown into positions so wretchedly false, and the redemption from which seems, for the present at least, so hopeless.

A PRISON PHILANTHROPIST.

Good is extinguished when it is rewarded. Even praise to a living philanthropist is to be deprecated. Yet it seems necessary, on other considerations, that publicity should be given to the proceedings of the now not unknown Thomas Wright of Manchester, who has attracted the attention of official persons connected with the jail of that town, by his unostentatious zeal in behalf of liberated culprits. A local paper describes him as a gray-haired man of sixty, the overseer of a foundry, and an elder in a dissenting congregation; a man, therefore, of humble grade and means, and yet a perfect hero of charity. It is Mr Wright's custom to attend in the prison of Manchester every Sunday evening to perform religious services with the inmates, and exhort them to reformation. He thus becomes acquainted with particular characters among them; and when their term of imprisonment expires, he endeavours, for such as he has a good opinion of, to obtain a restoration to society and to employment. The importance of this service to a penitent malefactor is of the highest consideration, as his greatest difficulty always is to re-establish that confidence without which employment is not to be expected; nor is its importance less to society, seeing that, for want of a ready access to a remunerative labour, many penitents are forced back upon their former courses. During the last five years, Mr Wright has got no fewer than seventy liberated prisoners into employment, and reconciled twenty to their friends; out of which united numbers only four have relapsed into error, and of these one is again reclaimed. What is also very striking, one of the restored men uses the means and influence he himself now possesses to befriend others on their liberation from prison, and actually has obtained employment for several of these unhappy beings—charity thus, as it were, reproducing charity. Altogether, these doings of a single right-hearted man, in the midst of a form of society which tends to make everything professional, and a source of gain, are most wonderful; and we feel bound to say, that we have seldom heard of a philanthropist at once exhibiting such enlarged views, and reducing them to so happy and useful a practice, as Thomas Wright.

A TOBACCO SPECULATOR.

A French newspaper makes the following statement: 'We learn that M. de Rothschild has arranged an affair which will insure him the monopoly of tobacco not only in France, but throughout the continent of Europe. He has for some time had agents in America to buy, by anticipation, the growth of all the plantations for a great many years to come. Thirty millions of francs have been appropriated to this vast speculation. The news has spread alarm among the capitalists who have entered into contracts with the royal tobacco manufactory, as it will soon be impossible for them to supply their tobacco at the stipulated prices.' What an unheard-of proceeding! One man, by wealth, to acquire a power of money-squeezing or taxing over every one of his fellow-creatures who is addicted to a by no means rare habit! The Dutchman and German, who live in an atmosphere of tobacco smoke; the Parisian gentleman, who could not want his cigar; the operative, to whom the short pipe is equally indispensable; the old woman, who would perish without her *tabatière;* all to become liable to a suffering in purse for the benefit of M. de Rothschild, because M. de Rothschild happens already to possess overgrown wealth. Is there not something alarming in this announcement, as if we were now to find the results of industry converted into the most serious of tyrannies? Why, at this rate, it would only require the profits of the tobacco monopoly to enable the monopolist to acquire a monopoly over sugar or tea; the profits of these united, to establish a monopoly of corn; and then we should have Mr D'Israeli's ideas of 'the Coming Man' realised with a vengeance—the aliment of the human race depending on the will and pleasure of an individual, and he a member of the house of Israel! Such may not practically result, but it is theoretically possible; and, on a simply philosophical consideration, nothing could be more curious. The profligate monopolies granted to courtiers, in the seventeenth century, for base and selfish reasons, here recur under totally different circumstances. Here reappears a power of units over multitudes, such as existed in similar force only in the earliest state of society.

MANNER OF EXPRESSING IDEAS.

Mr Dawson of Birmingham, in delivering a lecture on Mr Bailey's *Festus*, mentions that, in a certain read-

ing society, the poem went the whole round of the members without having its leaves cut open. It was for the purpose of drawing attention to the merits of this neglected production that Mr Dawson lectured. It was a book, he said, only for the initiated. All that we know of *Festus* is, that it is a long poem in an extremely mystical style, and containing many passages which strike an ordinary reader as extravagant. Yet we are willing to believe that, to a certain class of minds, able to go through with the perusal, this poem will appear to possess merit far beyond that of many more intelligible works. The remark we would make, however, is this: how unfortunate, if this be a true and great poem, that it should not be appreciable by a greater number of the author's fellow-countrymen! What a pity to present one's ideas in a style which wards off all but 'the initiated!' Is it utilitarianism to say this? Be it so; but surely also it is common sense. We feel the more concerned to express an opinion on the subject, because there is at present a tendency among young writers, in prose as well as poetry, to rush into a dark and Sibyline style, which they evidently think extremely fine, when it is only a blemish to the thoughts which they aim at expressing. It were very important, we think, at this moment, to have a just distinction laid down, in some authoritative quarter, between the respective values of the matter and the manner of writing. It forcibly appears to us that the matter is transcendently paramount. So that it be presented in terms which are clear, and not inconsistent with any of the requirements of taste, the grand end seems to us accomplished. To profess anything else is, in our view, to prefer the shadow to the substance, the *tailoring* to the *man*. The writers of the last age were sounder on this point than we: one used to say that a perfect style was like the atmosphere—the medium for seeing things correctly, but itself invisible.

THE MARQUESAS AND THE MARQUESANS.

The following description of these islands and their inhabitants may prove not an unacceptable sequel to the Adventure of Herman Melville, which appeared in our last number. The facts are derived from the published narratives of individuals who have visited Nukuheva, the largest island of the group, and the field in which the French have recently made attempts at colonisation in the Pacific.

The Marquesas were discovered, near the close of the sixteenth century, by a Spanish navigator, who named them, in honour of his patron, the Marquis Mendoça de Canete. There are thirteen islands, divided, by a channel of some breadth, into groups of eight and five; the largest having a length of twenty miles, with a circumference of about seventy. The coast is armed with promontories, which terminate in abrupt cliffs, and render the greater part of the shore inaccessible. A chain of hills, rising occasionally to a height of 3000 feet, stretches from one end of each island to the other, and the promontories are offshoots from that chain. The little valleys shut in between the ridges are of a triangular or semicircular shape, and afford the only ground capable of cultivation in the islands. There are none of them more than a mile in width at the point where they open out upon the sea, nor is any of greater length than two miles. Bays more or less convenient are found at the mouths of these valleys, some offering a safe anchorage to vessels; but many are too deep, or too much exposed to the winds.

The natives, who call themselves Kannaks, inhabit the valley plains, where they construct huts, very similar to those of the West Indian negroes, amidst the trees and plants from which they derive their support—such as the cocoa-nut tree, the banana, the sweet potato, and the bread-tree. The last of these furnishes their principal food. Oranges, citrons, sugar canes, and guava-trees, grow wild on the mountain flanks; and the soil also produces the cotton plant, the grape, nuts (the fruit of which contains an irritating oil), and a peculiar kind of chestnut, the fruit being larger, but of a worse quality, than the European chestnut. Tobacco grows without cultivation; and numerous aromatic plants fill the air with their fragrance. The hill-sides, to the very summit, are covered with rose-trees, palms, and ferns as large as shrubs. In consequence of the summer heats, vegetation is apt to become scorched, and this circumstance prevents the rearing of flocks. Cattle, goats, and swine, are found in a wild state; but for want of pasturage, they do not increase very rapidly, although the natives are not in the habit of hunting them. In their endeavour to colonise these islands, the French have met with considerable difficulty; and in an agricultural point of view, there does not seem much temptation to pursue their labours. Not a twentieth part of the surface can be brought into cultivation. Moreover, the spots which are capable of tillage are small detached pieces, having no means of internal communication, so that the only method of going from one to another is by sea.

The inhabitants construct their huts of the yellow bamboo, tastefully twisted together in a kind of wicker-work, and thatch them with the long tapering leaves of the palmetto. These huts are placed upon a stratum of stones, elevated a few feet above the ground, and are scattered about the valley without regard to regularity, generally under the shady branches of some lofty cocoa. Their shape is a parallelogram. The partitions which serve for walls are only three feet high, supporting a roof which rises to a height of ten feet. The door is almost always open; and the doorway is so low, as to render it necessary to stoop in order to enter. Each hut usually contains two or three families, with the exception of the royal residence, which the king's family alone inhabits. This cabin is constructed with more care, and is of larger size, than the others: it is here that the king receives the principal men of his dominions. Every one of the Marquesan islands has its king, whose authority extends over all the other chiefs of the island. These latter only rule in the bay where they live, and their power is entirely circumscribed by the limits of the valley. Indeed each valley may be regarded as containing a separate and independent community, who are in perpetual enmity with the inhabitants of the other bays. The authority of the ruling powers is firmly settled; and although living in familiar intercourse with those under them, their persons receive all the respect due to their stations. They are endowed with arbitrary power; but there is no instance of their prerogative being abused. Their subjects are bound to supply all their wants—no heavy task, under a climate so fair and fertile. The royal authority passes by hereditary descent from male to male.

The principal food of the Kannaks consists of the fermented fruit of the bread-tree, and the preparation of *poee-poee*, as they term it, forms their chief employment. A pit, five or six feet deep, is dug in the ground, the bottom being roughly paved, and the sides covered with dry herbs. The fruit is then stripped of its rind with the aid of the sharp edge of a shell, and it is pierced through and through with a splinter of wood, in order to forward the process of fermentation. The pit is filled about five-sixths with fruit thus treated, and the whole is covered up with herbs and large stones. At the end of five or six months, the mass becomes changed to a thick yellowish paste, exhaling a strong smell of leaven, in which state it is called *mâ*. The farther fermentation has proceeded, the more excellent the poee-poee is rendered; and it is asserted that in some pits there is mâ that has been there fifty years. The fermented matter is taken from the pit as it is required for use. A small portion is added to fresh fruit, and the mixture is baked in an oven, which is nothing more than a hole in the ground, in which fire is placed. Their method of cooking is to bruise the fresh fruit, add a portion of mâ, and mix the two in a trough made out of the hollowed trunk of a tree.

The whole is beaten with a stone pestle into a homogeneous paste. This is the Kannak delicacy called poee-poee. The paste has only to be tempered with a little water in a calabash, and the food is ready for use, the superfluous water being drunk at intervals during the repast. The poee-poee forms a nutritious diet, somewhat tart, but not disagreeable, even to European taste. The native mode of eating it is curious, and requires considerable dexterity of hand. Dipping the forefinger of the right hand into the dish, and giving it a rapid twirl, they draw it out thickly coated with the preparation, and then, with a second peculiar flourish, they convey it to the mouth without spilling a single drop. The awkwardness of Europeans, when attempting to eat poee-poee in this fashion, generally convulses the natives with uncontrollable laughter. This preparation is usually the only dish at their meals; but sometimes, when they have for once laid aside their characteristic indolence, they have the addition of pork or fish. Roasting is the sole method of cooking with which they are acquainted, for they have no vessel capable of bearing the action of fire. Fish are, for the most part, eaten without any dressing, and are considered in this way as a luxury.

A fermented liquor called *kava*, made from the root of a plant bearing the same name, is used in all the islands. The root is chewed in the mouth so as to extract the juice, and then spit out into a calabash. This is allowed to stand until fermentation takes place. The liquor possesses the combined properties of an acid and a narcotic. The men drink it to such an excess, that they are in a state of almost perpetual inebriety; yet alcoholic liquors introduced by foreigners are always preferred. The people are fond of tobacco, but being too idle to cultivate the plant in their own country, they receive their supplies from whalers. They are accustomed to form a smoking party in one of their huts: the pipe is passed from mouth to mouth, as no one inhales the smoke more than three or four times at once. The Kannaks fish with hooks and with nets by torchlight: they have also a third plan of taking fish, which succeeds very well. They go at flow of tide to the rocks, where they know that the finny tribe are plentiful. Whilst some hold a net stretched out under water, others plunge into the sea, and drive the fish towards the net. The pursuers then seize them, and ordinarily bring three fish to shore, one in each hand, and one in the mouth. To take bonitoes and flying-fish, they simply fashion a bit of mother-of-pearl into a hook. The fish snap at the unbaited hook, being doubtless deceived by its colour.

In general, the Marquesans are tall and well-made; but their strength by no means corresponds with their fine figures. This is owing to their diet being almost entirely vegetable, and to their abstaining from exercise. Their physiognomy is between that of the negro and that of the European. They are all—men, women, and children—excellent swimmers. They throw themselves fearlessly into the water several times a-day, and although in a state of perspiration, they suffer no harm. They are also dexterous climbers of trees, making the ascent like monkeys, with the hands and feet only. The men wear a girdle of *tapa*, a species of stuff made from the inner bark of the mulberry tree; this girdle is sufficiently long to pass twice round the body. To a similar vestment the women add another piece of tapa, with which they drape themselves not unfrequently in a graceful manner. The transition from barbarism to civilisation is always ludicrous. In those bays where Europeans have obtained a footing, the Kannaks array themselves in the cast-off clothing of their visitors; but when they retire inland, they resume the garment to which they are most accustomed. The men go bareheaded, and wear the hair cut in many odd fashions. Some have merely a tuft on the top of the head; others have two tufts, one on each side: some cut the hair on one side only; others do not cut it at all, but collect it behind, and bind it together. Tattooing is universally practised: it is made to extend over the whole body; and the gradations of rank are marked by its presence, the great men having their figures nearly black with it. Very often the tattooing of one side corresponds with the other: fishes and other objects are curiously mingled with straight lines and curves. When the women are tattooed, which rarely happens, it is only on their limbs and lips. Both men and women wear rudely-carved boar or sperm-whale tusks in their ears by way of ornament.

The life led by the Marquesans is usually quiet and monotonous. To dissipate the ennui inseparable from their indolence, they sometimes assemble and form a circle in a squatting position. They then strike their hands against one another, drawling out at the same time certain monotonous airs, which call to mind the vespers for the dead in Catholic countries. Their songs are nothing more than bare narrations of some important event or piece of news. On all great occasions they have festivals termed *coïnas*. In these they dance violently to music on flutes and tambours, the only instruments they possess. The flute is a bamboo with an opening near the closed end. They place the opening under one nostril, and having closed the other, they produce a single note by blowing into the cane. Their tambour is made of the hollowed trunk of a cocoa-nut tree, over the two ends of which the skin of a shark is spread. It would be difficult to imagine that anything very melodious could be drawn from these uncouth instruments. A coïna is always held whenever a victory has been gained. It is then that the horrible ceremony of eating the flesh of their prisoners takes place, the savage orgies being celebrated by the light of fires at night, in the midst of songs and dances.

The people in the different bays are almost always at war with one another. Their hostile expeditions are usually made in the night: then it is that an invading party advances in silence, and endeavours to surprise the inhabitants of a neighbouring bay. All who resist are slain; but everything that can be carried away is removed, including men, women, and children. These excursions are often undertaken without any previous provocation, and solely with a view to procure human flesh wherewith to celebrate a coïna. When an attack is made in open day, and there is no attempt to surprise, the two parties utter ferocious cries as they advance. On these occasions they make little use of their bludgeons, their weapons being chiefly firearms, procured from the crews of English or American whalers. The following is Mr Herman Melville's description of a warrior chief in his native costume:—'His aspect was imposing. The splendid long drooping tail-feathers of the tropical bird, thickly interspersed with the gaudy plumage of the cock, were disposed in an immense upright semicircle upon his head—their lower extremities being fixed in a crescent of guinea-beads, which spanned the forehead. Around his neck were several enormous necklaces of boar-tusks, polished like ivory, and disposed in such a manner, as that the longest and largest were upon his capacious chest. Thrust forward through the large apertures in his ears were two small and finely-shaped sperm-whale teeth, presenting their cavities in front, stuffed with freshly-plucked leaves, and curiously wrought at the other end into strange little images and devices. These barbaric trinkets, garnished in this manner at their open extremities, and tapering and curving round to a point behind the ear, resembled not a little a pair of cornucopias. The loins of the warrior were girt about with heavy folds of a dark-coloured tapa, hanging before and behind in clusters of braided tassels; while anklets and bracelets of curling human hair completed his unique costume. In his right hand he grasped a beautifully-carved paddle-spear, nearly fifteen feet in length, made of the bright koar-wood, one end sharply pointed, and the other flattened like an oar-blade. Hanging obliquely from his girdle by a loop of sinnate was a richly-decorated pipe: the slender reed forming its stem was coloured with a red

pigment; and round it, as well as the idol-bowl, fluttered little streamers of the thinnest tapa. But that which was most remarkable in the appearance of the splendid islander, was the elaborated tattooing displayed on every noble limb. All imaginable lines, and curves, and figures, were delineated over his whole body; and, in their grotesque variety and infinite profusion, I could only compare them to the crowded groupings of quaint patterns we sometimes see in costly pieces of lacework. The most simple and remarkable of all these ornaments was that which decorated the countenance of the chief. Two broad stripes of tattooing, diverging from the centre of his shaven crown, obliquely crossed both eyes—staining the lids—to a little below either ear, where they united with another stripe, which swept in a straight line along the lips, and formed the base of the triangle. The warrior, from the excellence of his physical proportions, might certainly have been regarded as one of nature's noblemen; and the lines drawn upon his face may possibly have denoted his exalted rank.'

The Kannaks' treatment of their sick is in the highest degree cruel and unnatural. Instead of giving assistance, every one shuns the invalid; and if he is thought to be at all in the way, he is taken to some distant spot, whither it is thought sufficient to carry him food at intervals. It is also a custom of theirs to prepare the dying man's coffin before his eyes; and, what is still more incredible, when they see him about to render up his last sigh, they place a bit of moistened tapa in his mouth, whilst the fingers of some friend are employed in closing the lips and nostrils. Death of course is the immediate consequence. This proceeding has its origin in the notions which they entertain as to the nature and future destiny of the soul. They suppose that the soul, the principle of existence, has its seat in the epigastric region, and escapes from the body along with the parting breath. They therefore believe that, by shutting the orifices through which the breath is sent, they prevent the egress of the vital principle, which remains in its place, and continues to live, until the body has entirely wasted away. During the period of decomposition, another body is in process of creation in a far-distant island, where all the good things of this life are found in abundance, and the soul flies thither as soon as its old habitation is completely destroyed. If death were allowed to steal upon its victim in the natural way, the soul would escape from its receptacle, wander into empty space, and die of inanition. Death being thus hastened, the body is anointed for several days with cocoa-nut oil, and then conveyed to a solitary hut called a *morăi*, prepared expressly for it. Care is taken to place poee-poee, and whatever else the soul may require for its sustenance, in the inside of the coffin. With regard to children, however, their bodies are not carried to a morăi, but are deposited in a kind of basket, which is suspended from the branches of a cocoa-nut tree especially devoted to this purpose.

Notwithstanding these and other superstitious observances, the idea of religion is but faintly developed among the Marquesans. Wooden images, rudely carved, have been occasionally seen; yet worship is but seldom, and then only coldly, offered to them. Indeed the poor images are cuffed and kicked about in the most irreverent manner, just like any other block of wood or stone that may lie in the way. A class of priests and priestesses exists, it is true, ranking next the royal personages; but their functions have nothing at all to do with the observances of religion. They are occupied in publishing the commands of the king, in presiding at the great festivals, and in imposing the *taboo*; which last operation consists in declaring that certain persons, things, or places, are sacred, and thenceforth it is unlawful to touch the persons and things, or to place the foot in those places. The high priests also undertake to foretell events, and are frequently consulted previous to a battle.

Their division of the seasons is simply into wet and dry, and indeed any exacter partition would not be very easy. The moon is watched to indicate the lapse of time; and the bread-fruit tree enables them to calculate roughly the period of a year, since about three crops of fruit are equal to thirteen lunar months. As for the reckoning of past time, the epochs by which they date are irregular and uncertain. They calculate by generations—a mode only adopted by certain families who pretend to a greater antiquity than the rest, and by the royal house. In these families a sacred cord is preserved, to which a knot is added whenever the head of one of them dies.

The language is described as very poor. The alphabet includes only fourteen of our letters; but there are others which it is impossible to express exactly in English.

FATHER BLACKHALL'S SERVICES.

FIRST ARTICLE.

'A Brief Narrative of the Services Performed to Three Noble Ladies, by Gilbert Blackhall,' is one of the books printed by the Spalding Club in Aberdeen. It affords some curious peeps into the state of society in the north of Scotland in the first half of the seventeenth century, especially those families by whom the Catholic faith was still adhered to. The reverend father is an arrant gossip. He is curious in the everyday pursuits, the tempers, the occupations, nay, the clothing and feeding, of those with whom he was concerned. Moreover, he was an ill-requited man. He had the highest possible opinion of his own merits and exertions; but he did not find other people ready to acknowledge his claims; hence he set them forth, with all due precision and minuteness, in a narrative which fills a considerable quarto volume. Had he not been a weak-minded man, occupying himself in trifles, he probably had gained a great reputation by some folio volume, written in Latin, against Luther and John Knox, but we would not have had the curious pictures of national customs and grotesque incidents with which his garrulous narrative supplies us. The first person to whom we find Father Blackhall performing his services is the Lady Isabel Hay, daughter of the Earl of Errol. This lady, after her mother's death, went to France in 1630. A certain Mr James Forbes was her father's friend and correspondent in France, and she was, as merchants say, 'consigned to him.' He appointed Blackhall her confessor; 'which he did repent thereafter,' as Blackhall says; and indeed the chief purport of the narrative is to describe the efforts which her spiritual adviser made to protect her from the unseasonable addresses of Mr Forbes. There is much curious matter in this part of the father's narrative; but we must pass from it to another portion of his adventures, in which we think the reader will probably be more interested.

At the conclusion of his engagement with Lady Isabel, he received an application from the Lady Frendraught, celebrated for the suspicion under which she fell, a few years before, of having set fire to her house, in order to burn Lord Aboyne in it.* The horror of this event appears to have deterred the reverend father from such a connexion. He says—'My Lady of Frendraught did send to me, praying me to come to her, for the *frère* she had before was lately departed from this life. I refused absolutely to see her, because she was suspected to be guilty of the death of my lord of Aboyne, who, seven years before, was burned in the castle of Frendraught: whether she be guilty or not, God knoweth, for that hath not been yet discovered.' Fate determined that, instead of the suspected murderess, he should ally himself with the Dowager Lady Aboyne, the widow of the victim; and he entered the service of 'this truly noble and religious lady' about the middle of July

* See an account of this strange tragedy in former series of the Journal, vol. iv., 101 (No. 169).

1638. Though the Roman Catholics were a proscribed body through Scotland generally, the Marquis of Huntly, and some other Catholic lords in the north, possessed a considerable extent of feudal power for the protection of themselves and their adherents; and such a person as Blackhall, if not absolutely secure, would be removed from many causes of apprehension by such an alliance. In addition to their claims on the respect of the people as their spiritual advisers, these priests could found on the dangers and hardships they were perpetually liable to; and as they were execrated and hunted beyond their own community, they seem to have obtained the greater privileges, immunities, and benisons within it. In his new appointment, the reverend father loses none of that spirit of inquiry and interference regarding small matters for which he has already appeared so conspicuous. We find him thus describing his position in the household, and the order he thought fit to take concerning it. 'I did eat in my chamber as they who were before me used to do: four dishes of meat was the least that was sent to me at every meal, with ale and wine conforming; which I thought superfluous; but knowing the noble disposition of the lady, who gave the order herself for all the tables, as well of her servants as her own, I would not so soon utter my mind, until I should know better how my admonitions would be received. I asked my man what was done with the relics of my table. He answered me boldly that he sold them, and said the relics of priests were due unto their men. When I did hire you, said I, did I promise you such casualties? No, sir, said he; but it is the custom of this house, as all the servants will bear witness. They are fools, said I, and not capable to bear witness who give testimony to their own prejudice. What prejudice is that to thee? said he. My lady doth bestow the meat upon you, and asketh no count of it back again; so what you leave, I think should be for me rather than for any other body. If I did buy the meat myself, said I, was I bound to give you all that rested over my own suffisance, so that I could not bestow it in any other way after you had got your suffisance of it? No, said he; you might dispose of it at your own pleasure, and so doth my lady, who wills your man [to] get what you leave. No, said I; my lady wills, and I likewise, that thou carry to the kitchen all that I leave, both meat, bread, and drink, that all may serve the common table; and go thou to it, and there take your part of all, as the others do. And if thou determine anything another way, thou shalt not serve me one hour longer. I told my lady afterwards this dialogue which passed between my man and me, whereat she did laugh well; and this did acquire me the affections of the servants, who grudged, but could not mend it; for they knew that my lady would not take notice of such base things, much less correct them.'

The people in the neighbourhood seem not to have been in general Roman Catholics; for the father complains much of their importunate curiosity, saying that 'if he but opened the window, they ran to see him, as some monstrous thing;' and one woman declared she hoped to wash her hands in his heart's blood. Aboyne castle stands near the village of Charlestown of Aboyne, close to the river Dee, and thirty miles from its mouth at Aberdeen. Eastward, descend fine sweeps of arable land towards the coast, while to the west begins the great Highland range of the Grampians. There, in the close vicinity of their strongholds, the lands of Aboyne were subject to perpetual depredations by the Highland reivers of the day. The lonely widow appears to have had but a scanty retinue for so wild a neighbourhood, and we find her obliged to add to the accomplished Blackhall's titles of priest and chamberlain, that of captain of her castle. He describes the manner in which he repelled one of these invasions; and it is clear that his own prowess on the occasion has not been neglected by the historian. When a visitation by friends was of the following character, the nature of an inroad from neutrals or enemies may be anticipated:—

'The very first that obliged us to make use of our arms were the Marquis of Huntly's* own men of Badenoch. They had been at Aberdeen getting arms, some forty or thereabout, with their officer, Thomas Gordon, a proud and saucy rascal. They, coming up the north side of the water of Dee, came to Aboyne, and presented themselves upon the Peat Hill; and Thomas Gordon, leaving the rest there, did come with three others to the gate, which I made to be kept fast. I sent Thomas Cordoner, the porter, to the gate to ask what they desired. Thomas the officer answered boldly that they would lodge in the house, because they were my lord's men, and the house was also his; and that the night before they had lodged in the place of Drum; which I knew to be false, for the laird of Drum was not a man to lodge such rascals in his house. When the porter told me this so insolent answer, I did go to the gate; for I had the key in my pocket, and did not give it to the porter, fearing that he might be so simple as to let them in, and we should have had more pain to put them out than to hold them out. I did take with me six good fellows, every one with his sword at his side and a light gun in his hand, and placed them all on one side of the alley that goes from the outer gate, betwixt two walls to the court, every one three or four spaces from another, and made them turn their faces and the mouths of their guns a slanting way, not right to the port, nor to the wall over against them, but a middle way betwixt them both, that they might see both at once. * *

'When I had placed them thus, and encouraged them, I did go to the gate with a bended pistol in my hand; and before I did open the wicket, I told them to retire themselves, all but one, to speak to me: they did so. Thomas Gordon only stayed; the rest were retired only the matter of ten paces, ready to rush in if he could have thrusted up the wicket fully. Then I did open it a little, so that he might see my soldiers in the alley. Before he did see them, I asked them what they did come here to seek? He very confidently said, We will see my lady, who we know will give us money, and lodge us; and with that was pressing in his shoulder; and I, seeing his impudence, said, As you love your life, stir not to win in, otherwise I will discharge my pistol in your heart; and you shall not see my lady, nor get anything from her, unless it be meat and drink without the gate; but none of you shall come within it, and go out again living. Sir, said he, we are my lord's men, and this house is his, and why may we not lodge in it? Have you an order from my lord, says I, to lodge here? Let me see his order. Sir, it is my lord's will that we lodge in his land. Then go seek his land, and lodge in it; for he hath no land nor house here so long as my lady liveth; but if my lord were dwelling here himself, durst you present yourselves to his gate to lodge with him? No, said he, we must respect my lord. You base fellow, said I, should not ladies be respected as much as lords, and more. But you have not so much honesty as to respect anybody. But put in your head, and see how we are prepared to receive you; and tell your neighbours that you shall get no other money here than that which shall come out of these guns, nor lodging, unless it be graves to bury you; and therefore retire yourself, that I may shut the gate. He retired malcontented; and my lady did send meat and drink to the foot of the Peat Hill, forbidding them to live upon her tenants, but bade them lodge in taverns, paying what they should take; otherwise, they should not go far unpunished. They did so, and went away the next day peaceably.'

The next visit was from a party of the clan Cameron, who were at first perplexed by the diplomatic skill of Blackhall, but had subsequently to yield to his warlike prowess. The marauders commenced operations by plundering a tenant's house.

'So we marched with a dozen of guns, eight pistols,

* The deceased Lord Aboyne was son to this great noble, the chief of the clan Gordon.

and my big carabine. Before we went out at the gate, I told them what order I desired to be kept, which was this: we must seek by all means to surprise them in the house plundering; and to do it, we must march as the Highlanders do, every one after another, without any words among us.'

Blackhall then gives all the necessary orders to his men as to where they were to place themselves, so as to guard both door and windows; and says, 'How soon we were in the court, I said with a loud voice, Every one to his post; which was done in the twinkling of an eye. Then I went to the door, thinking to break it up with my foot; but it was a thick double door, and the lock very strong. Whilst I was at the door, one of them did come to bolt it; and I, hearing him at it, did shoot a pistol at him. He said afterwards that the ball did pass through the hair of his head: whether he said true or not, I know not. I did go from the door to the windows, and back again, still encouraging them, and praying them at the windows to hold their eyes still upon our enemies, and to kill such as would lay their hands to a weapon; and to those at the door to have their guns ever ready to discharge at such as would mean to come forth without my leave; and still I threatened to burn the house and them all in it, if they would not render themselves at my discretion; which they were loath to do, until they saw the light bundles of straw that I had kindled to throw upon the thatch of the house; although I did not intend to do it, nor burn our friends with our foes. But if Malcolm Dorward, and his wife and servants, and his son John Dorward, and John Cordoner, all of whom the Highlanders had lying in bonds by them, had been out, I would not have made any scruple to have burnt the house and all the Highlanders within it, to give a terror to others who would be so brutal as to oppress ladies who never wronged them.

'They, seeing the light of the burning straw coming in at the windows, and the keepers of the windows bidding them surrender themselves before they be burnt, called for quarter. I told them they should not get other quarter but my discretion; unto which, if they would submit themselves faithfully, they would find the better quarter; if not, be at their hazard. Thereupon I bade their captain come and speak with me all alone, with his gun under his arm, and the stock foremost; but if any did press to follow him, they should kill both him and them who should press to follow him. He did come out as I ordained, and trembled as the leaf of a tree. I believe he thought we would kill him there. I did take his gun from him, and discharged it, and laid it down upon the earth by the side of the house. Then, after I had threatened him, and reproached their ingratitude, who durst trouble my lady or her tenants, who was, and yet is, the best friend that their chief Donald Cameron hath; for, said I, he will tell you how I and another man of my lady's went to him where he was hiding himself with his cousin Ewan Cameron, in my lady's land, and brought them in croup to Aboyne, where they were kept secretly for three weeks, until their enemies the Covenanters had left off the seeking of them; and you, unthankful beast as you are, have rendered a displeasure to my lady for her goodness toward you. He pretended ignorance of that courtesy done to his chief.' Blackhall then made him swear that all that had been plundered from the tenants should be restored, and what had been consumed should be paid for; and also 'made him swear by the soul of his father that neither he, nor none whom he could hinder, should ever hereafter trouble or molest my lady or any of her tenants.' He then ordered every man separately to come out and take the same oath.

'They did all come out severally, and took the same oath as I had commanded them; and as they did come to me, I discharged their guns, to the number of six or eight-and-forty, which made the tenants convene to us from the parts where the shots were heard; so that, before they had all come out, we were nearly as many as they, armed with swords, and targets, and guns. When they had all made their oaths to me, I ranked our people like two hedges, five spaces distant from one another's rank, and but one pace every man from another in that same rank, and turned the mouths of their guns and their faces one towards another, so as the Highlanders might pass, two and two together, betwixt their ranks: they passed so from the door of the hall in which they were, to the place where their guns were lying all empty. They trembled passing, as if they had been in a fever quartan.' He and his men then saw the marauders fairly off Lady Aboyne's lands, and, returning to Aboyne, 'told my lady the event of our siege, who was very joyful that there was no blood shed on either side.'

The state of letter-writing is fully disclosed by the fact, that, in the space of eleven and a half years, Lady Aboyne had only received two letters, and these were from two of her sisters. Indeed she appears to have lived a most lonely, desolate life. At her death, all her care seems to have been that her daughter, her only child, might be brought up in the Catholic religion. For this purpose she had previously charged Blackhall with the care of her; and manfully did he redeem the pledge, as we find related in the chapter entitled 'The Good Offices done to Madame de Gordon, now Dame D'Attour to Madame; by Gilbert Blakhall, priest'—which we shall make the subject of a separate paper.

PAUPER COLONIES OF HOLLAND.

Every one must have heard something of Dutch husbandry—its formal regularity, thrift, and unparalleled tidiness. Few, however, may be acquainted with the agricultural colonies of Holland—those pauper establishments so peculiarly adapted to the genius of the country, and consequently so pregnant with advantage not only to the class for whom they are directly intended, but to the community in general. It is now upwards of twenty years since they were established, a time sufficiently ample to test their value; and we readily avail ourselves of the narrative of a recent tourist,* to convey to our readers some idea of their system and economy.

'The first place in Holland I went to visit connected with agriculture, was the agricultural colonies at Fredericksoord and Willemsoord. They were established when, after two years of great scarcity, a large proportion of the population were reduced to absolute destitution, and depended entirely for their subsistence on the charities of their more fortunate countrymen. So prevalent did the practice of begging become, that it was found necessary to do something to relieve those unfortunate men who were willing, but unable to get work. A society was therefore formed by a few benevolent individuals, the object of which was to give employment to men in this deplorable condition. In carrying out their purpose, they conferred not only an immediate and lasting benefit on the individuals in question, but effected great national advantages; first, by stemming the spread of vice, which would have been the natural consequence of such destitution; and, in the second place, by increasing the national resources, in converting to arable land a waste on which even a sprig of heather was scarcely to be met with. Such was the origin of these colonies twenty-four years ago. And no one can travel the road along which they are situated, without noticing the great change that has been effected on the face of the country by their establishment; and the change is doubly observed when we pass from the unimproved waste to the neat cottages which line the road. From a wild barren country, we enter at once a little oasis, which bears every mark of prosperity; neat cottages, betraying the Dutchman's taste in their clean appearance, crops as luxuriant as if nurtured by a better soil, and gardens stocked with useful vegetables, and adorned

* Sketches of Belgian, German, and Dutch Husbandry, in the Quarterly Journal of Agriculture for 1846. Blackwood, Edinburgh.

with a variety of flowers. Each house is placed at the road-side, in the middle of the plat belonging to it, and directly opposite to another on the other side of the road. The buildings are all in one; the part allotted to the cow and pig being built of wood, and the cottage of brick. In the cottage are two rooms: one of them is large, and answers the purpose of kitchen, dining-room, and bed-room for some of the family; the other is small, and contains only a bed at one end, and at the other a closet, which answers the purpose of a milk-house. Great attention is paid to the dung, which is put up into neat heaps at the back of the house, consisting of alternate layers of turf and manure from the byre, and watered every now and then by the liquids previously collected from all the houses in a cask sunk in the ground.

'In Willemsoord, which is the smaller of the two colonies, there are 176 such houses, all tenanted by paupers but six, whose occupiers pay rent for their farms. The quantity of land attached to each house is about seven acres imperial. The colonists are all supplied with implements on entering on their plat, besides a cow and pig. The food of the colonist is for the most part potatoes and rye-bread, with milk; little or no flesh being used. The small farmers pay L.3, 15s. a-year for their plat; but the whole produce of the colonists' land is taken to the general magazine. There is a regular creditor and debtor account kept with them from their first entering the colony. Everything they receive on entering is marked down against them; and whenever they are enabled to pay off their debts, from economy of living, they are allowed to rent their plats. Some have succeeded in this; but the instances are rare. The scheme is not to be looked at in the light of a speculation, for as such it was never intended; but it has sufficiently succeeded in the object for which it was designed; namely, the relieving of the destitute, besides the consequent advantages referred to before. Attached to these colonies are others of a penal character, to which unruly members are sent, and which are subjected to more rigorous laws than are necessary in the free colonies.

'The wages and rations allotted to them are as follows:—Suppose a family of eight individuals, husband, wife, and six children, three of whom, with their father, work, the other three go to school, while the mother remains at home. The sums set down for wages here are only imaginary, being somewhat higher than are generally allowed:—

	Per Week.
Man at 10d. a-day,	L.0 5 0
Son at 10d. a-day, and other two at 2s. 2d. each per week,	0 9 4
Wages earned for whole family per week,	L.0 14 4
From which is deducted—	
Winkel geld, L.0 5 4	
Bread, potatoes, and clothing for eight, 0 8 0	per week.
L.0 13 4	0 13 4
Which is put down to their credit for future emergencies,	L.0 1 0

By winkel geld is meant money for buying little necessaries; such as coffee, tobacco, &c. The allowance of it for each person is 8d. a-week. The allowance for bread, potatoes, and clothing, is 1s. per week for each person. The only crops grown by the colonists are rye, potatoes, and grass. The farmers grow what they choose.

'There are several overseers, who superintend the work done in the colonies. Attached to them are schools for the gratuitous education of the children, and also workshops in which they are taught some useful trade. I passed one of these shops, in which there were from thirty to forty looms worked by the children; and adjoining it was another room, where some were engaged in spinning, mending shoes, and other occupations. I was attracted to the place by the busy clatter of the shuttles, and sounds of music, which proceeded from it; and on coming up to it, found them engaged at their respective occupations, cheering on one another in their work by a song in which they all joined. What health, what happiness, shone in these pauper children's faces! Their looks were a sufficient proof of the benefits derived from such an institution.'

So much for the system; now for the principles upon which it is founded. There is not a sounder maxim in political economy, than that every man should labour for his own support, and if he cannot obtain labour, that it should be furnished to him by the state; for it is certainly better that he should contribute, however little, to his own maintenance, than that he should be upheld in idle indigence. Of course the kind of labour will differ, according to the facilities of the district, as that may be maritime, manufacturing, or agricultural; but this matters little, so long as the labour is of a profitable kind. Perhaps of all species of labour, agriculture is the most universally applicable, as its object is the production of food, a commodity the demand for which never fails; and not only the production, but the increase of food, as every effort of culture is attended with a proportional fertility of the soil. In Holland, where agriculture is conducted on what may be called the garden system—that is, a careful and ceaseless attention to a comparatively small plot—such colonies are particularly appropriate. There culture is carried to such perfection, that a man, if not absolutely idle or prodigal, may thrive on his little allotment; and the state, taking this into account, puts the pauper in the way of making his own livelihood, if he chooses. If not, he is handed over to the penal colony, where compulsion is substituted for free-will.

Taking these matters into consideration, our tourist naturally puts the question, 'Is the establishment of such societies impracticable in our own country? Are there not thousands of unimproved acres, that have been condemned as useless, many of which exceed in fertility the waste in which the Dutch colonies are situated? Are there not hundreds of unemployed hands who crowd our poor-houses and pauper rolls, who frequent our roads and streets as mendicants, who haunt our lanes as degraded miscreants, advancing their poverty as a palliation of their vices and crimes? Is there not money raised to relieve the destitute? And are there not many benevolent individuals who, by the gratuitous bestowment of their charity, encourage idleness and foster vice? In Britain, truly, we have the elements for such a society, but we want some master-spirit to bring them together, and put them into operation. It is a subject that cannot be too strongly pressed upon proprietors of land, as the best way of improving the waste portions of their properties, and of reducing at the same time the burdens with which their cultivated lands are so heavily taxed.' These questions require to be answered with caution: than pauperism, there is not a more difficult question to deal with in the whole range of political economy.

Conducted as the Dutch colonies are, the system seems at once fraternal and politic. It places the individual in a position to earn his own subsistence, and to raise himself from pauperism to that of an independent rent-paying farmer. It is true that his family may increase, and by this means he may be kept in pauperism; but then, from the care which the society takes of these — in educating and training them to industrial habits — they start from a better position than their parents, unaided, could have acquired for them. To plant a poor man on a piece of land, is to do but little for him, unless he has the hope of rising, by his industry, from begging to honest independence; and this the Dutch system seems calculated to accomplish. We are by no means in favour of a mere cottage system, which may furnish a man temporarily with bread, and tempt him, as it were, to bring into existence a large family, for whom he can do almost nothing; thus increasing pauperism by increasing its numbers. But we do see much force and truth in a system which while it places a man in the way of earning his livelihood, places him also in a position from which he may

rise, by industry and economy, to something better than he was before. As long as a Dutchman holds his allotment from the society, he is but a pauper; so soon as, by his savings, he pays off their claim, he becomes a rent-paying farmer; and this rent-paying condition is one of hope and encouragement. Complicated and distracting as the subject of pauperism is, the agricultural colony system of Holland seems one at least worthy of imitation in certain districts of our own country. It is not an untried novelty, like the many schemes which are annually promulgated in Britain: twenty-four years of endurance, if not of success, is at the least no slight recommendation.

MORAL COURAGE.

[From an American Newspaper.]

Have the courage to discharge a debt while you have the money in your pocket.

Have the courage to do without that which you do not need, however much you may admire it.

Have the courage to speak your mind when it is necessary that you should do so, and to hold your tongue when it is better that you should be silent.

Have the courage to speak to a poor friend in a threadbare coat, even in the street, and when a rich one is nigh. The effort is less than many take it to be, and the act is worthy a king.

Have the courage to set down every penny you spend, and add it up weekly.

Have the courage to tell a dramatic author that his piece is unfit for presentation to a manager, when your opinion is asked concerning it.

Have the courage to admit that you have been in the wrong, and you will remove the fact from the mind of others, putting a desirable impression in the place of an unfavourable one.

Have the courage to adhere to a first resolution when you cannot change it for a better, and to abandon it at the eleventh hour upon conviction.

Have the courage to make a will, and, what is more, a *just* one.

Have the courage to face a difficulty, lest it kick you harder than you bargain for. Difficulties, like thieves, often disappear at a glance.

Have the courage to leave a convivial party at a proper hour for so doing, however great the sacrifice; and to stay away from one, upon the slightest grounds for objection, however great the temptation to go.

Have the courage to dance with ugly people, if you dance at all; and to decline dancing, if you dislike the performance, or cannot accomplish it to your satisfaction.

Have the courage to say you hate the Polka, and prefer an English song to an Italian 'piece of music' [if such be really your taste].

Have the courage to shut your eyes on the prospect of large profits, and to be content with small ones.

Have the courage to tell a man why you will not lend him your money; he will respect you more than if you tell him you can't.

Have the courage to cut the most agreeable acquaintance you possess, when he convinces you that he lacks principle. 'A friend should bear with a friend's infirmities'—not his vices.

Have the courage to wear your old garments till you can pay for new ones.

Have the courage to thrust your legs down between the sheets in cold weather; and to shave every day before breakfast.

Have the courage to pass the bottle without filling your glass, when you have reasons for so doing; and to laugh at those who urge you to the contrary.

Have the courage to wear thick boots in winter, and to insist upon your wife and daughters doing the like.

Have the courage to review your own conduct; to condemn it where you detect faults; to amend it to the best of your ability; to make good resolves for your future guidance, and to keep them.

Have the courage to decline playing at cards for money, when 'money is an object,' or to cease playing, when your losses amount to as much as you can afford to lose.

Have the courage to prefer propriety to fashion—one is but the abuse of the other.

[We beg to add another counsel which we have always regarded as of the highest importance—

Have the courage to confess ignorance whenever, or with regard to whatever subject, you really are uninformed.]

THE DEW-DROP AND THE STREAM.

[The following beautiful lines, which we find in a newspaper, are said to be the production of a servant girl from Devonshire.]

The brakes with golden flowers were crowned,
And melody was heard around—
When, near the scene, a dew-drop shed
Its lustre on a violet's head,
And trembling to the breeze it hung!
The streamlet, as it rolled along,
The beauty of the morn confessed,
And thus the sparkling pearl addressed:

'Sure, little drop, rejoice we may,
For all is beautiful and gay;
Creation wears her emerald dress,
And smiles in all her loveliness.
And with delight and pride I see
That little flower bedewed by thee—
Thy lustre with a gem might vie,
While trembling in its purple eye.'

'Ay, you may well rejoice, 'tis true,'
Replied the radiant drop of dew—
'You will, no doubt, as on you move,
To flocks and herds a blessing prove.
But when the sun ascends on high,
Its beam will draw me towards the sky;
And I must own my little power—
I've but refreshed a humble flower.'

'Hold!' cried the stream, 'nor thus repine—
For well 'tis known a Power divine,
Subservient to His will supreme,
Has made the dew-drop and the stream.
Though small thou art (I that allow),
No mark of Heaven's contempt art thou—
Thou hast refreshed a humble flower,
And done according to thy power.'

All things that are, both great and small,
One glorious Author formed them all;
This thought may all repinings quell:
What serves his purpose, serves him well.

SELF-ENERGY.

Self-energy is the true life of a man. To think by other men's thoughts, is no true living thinking; to believe by other men's belief, is no true living faith. The mind must, by its own independent exertions, seek, and, so far as its native powers will enable it, arrive at, the *modes* and *causes* of the truth of those propositions it receives as truths, or substantially it will think and believe nothing. Substantially, neither will the propositions exist for it, nor it for them. They will be nonentities; and it will only dream of understanding them.—*Cromwell's Literary Florets.*

WHOM TO LOOK TO.

There are six sorts of people at whose hands you need not expect much kindness. The sordid and narrow-minded think of nobody but themselves; the lazy will not take the trouble to serve you; the busy have not time to think of you; the overgrown rich man is above minding any one who needs his assistance; the poor and unhappy have neither spirit nor ability; the good-natured fool, however willing, is not capable of serving you.—*Burgh.*

LIBERTY.

Liberty is to the collective body what health is to every individual body. Without health, no pleasure can be tasted by man; without liberty, no happiness can be enjoyed by society.—*Bolingbroke.*

SALEABLE CIVILITIES.

We observed the other day, in a popular magazine, an anecdote of a gentleman who, having dropped a package of papers, and getting it restored to him by a working man, who ran across a street for the purpose, *was so shabby* as merely to render thanks in return. The writer seemed to consider it necessary that the gentleman should have given at least sixpence as a remuneration for this act of ordinary civility. This way of thinking touches upon a feature of our age, especially as regards metropolitan life, which is worthy of a few remarks.

It seems to be now held as a fixed point of duty amongst us, that whenever a gentleman, by choice or accident, receives the least civility from his inferiors, he should reward them in money. It may be something costing hardly an effort, something called for by the exigency of a moment, and done through merely instinctive impulse; yet coin must honour it. The simplest charities of life become a matter of tariff between superiors and inferiors.

Let us proceed to illustrate this part of our national code of morality. We were once placed in circumstances in Paris strongly reminding us of Sterne and his grisette. Wandering along its obscure streets, we lost our way, and appeared likely to have roamed on for ever, as each new street seemed the precise facsimile of the last, until at length we ventured to ask the way from a busy, little Frenchwoman, seated at the door of her shop. A thousand different directions, uttered in a thousand different phrases, sent us away as perplexed as before. Led by blind chance, we directed our steps straight on, and passed a street down which we ought to have turned. We had not gone far, when a great outcry was heard behind us, joining itself to the clatter of a couple of wooden shoes. Monsieur was altogether wrong; and we were led to understand that we might have girdled the globe in that direction without arriving at our destination; however, the error was corrected, and we speedily reached home. We were in precisely the same predicament in London, and had occasion to ask for similar instruction from one of two lumping boys idly lounging at the corner of a street. What was our success? The boy declined affording the requisite information gratuitously, but offered to put us right in two minutes for twopence. Behold the contrast! Assuredly, many though the social errors of our neighbours are, mercenary civility is not to be reckoned among them.

Every-day life supplies us with abundant instances—they must occur to every one—of the venal light in which all little good offices are regarded in England. If a horse has broken his bridle, and gambolled a few yards down the street, and is brought back an unwilling captive by some adventurous person; if a memorandum is dropped, and some lucky boy has picked it up, and restored it to its rightful owner; if, on a blustering day, the wind *will* take your hat off, and it scampers down some hilly street, and is caught by some fleet-legged errand-boy, who has participated with some half dozen others in the fun of the capture; if your handkerchief hangs from your pocket, and some extra-honest passer-by informs you of the circumstance, with a touch of his hat, intimating that your honour might have lost it; if you sprain your ankle, or fall over a shred of orange-peel, or are knocked down by some runaway horse, and are assisted by some humane members of the surrounding mob into a neighbouring surgery; if, in short, in any of the thousand misfortunes which are daily apportioned to us, an inferior renders assistance to, or does some little office for, his superior, a debt is incurred; it is a cash account; creditor and debtor are the synonyma for obliger and obligee: humanity, good-nature, nay, the first elements of the Christian duty of man to man, are obliterated from the minds of both parties, and the obligation can only be discharged by treating it as so much merchandise, and paying for it. It would be far from difficult to construct a scale of metropolitan civilities, and to affix the orthodox rates to each of the minor kindnesses; thus—

Holding a horse for a few minutes, twopence—if with extra politences, fourpence.

Directions in topography, or street-seeking, twopence—with personal attendance, threepence.

Picking up a handkerchief, one penny to boys, twopence to men.

Shutting a cab-door, to the waterman one penny—where does your honour want to go?—twopence.

Assistance in case of accident—varies from sixpence to a shilling;

and so on. He who would be so foolhardy as to refuse these regular demands, while his bravery might be extolled, would incur the odium of every bystander, and might think himself fortunate if he escaped the open execrations of the disappointed benefactor.

Such a state of things is very disgraceful in an age calling itself an era of refinement, and turning up its nose at all bygone times, as if there were nothing that was good or great in them. If out-of-door civility must have its price, let there be a regular body of such 'helps' enrolled at once; give them a regular livery, and let each wear a brazen badge, denoting his number and the regular rate of payment for all sorts of civilities; and thus deliver honest men from the insult and injury of the degradation of their brotherly-kindness to the level of, or rather to an inferiority to, the base metal with which it is bought and for which it is sold.

We are continually being disgusted with applications for beer, for something to drink our health, for something to grease the wheels of our gig with, for some-

thing to water our garden with, or to sprinkle the dusty road with. If the carpenter has done some trifling job, when he comes to be paid, something must be given over and above his regular pay to wet the work with, or it is impossible that it will stand. If the dustman perform his arduous office, and, after relieving our dust-bin of its contents, comes up, with cindered hair and grimy face, to acquaint us with the fact, surely we could not deny him something to wash down the dust with which he is pretty nigh choked. If the sweep has been putting the chimney to rights, then 'the heap of soot there was to be sure—never seed a chimbley so foul—he always was so pettickler about them smoke-jacks—he knowed a many sweeps as 'ud smesh them all to nothing: could our honour give him something to oil his husky throat with?'

The principle on which such demands are made seems to us wholly bad. It is on this, the hydra whose hundred heads spring up in every possible direction, that we would animadvert. The work done, of course, is worth its pay, just as much as twenty shillings are worth a sovereign. The demand is made for the civility with which its performance is attended—a demand, by the way, invariably greater in proportion to the civility with which the workman himself has been treated. Such civility, we would say, is due, and ought to be rendered, merely as a requirement of the social compact between man and man in all ranks and spheres of life. This custom of performing work in a civil manner, merely with the ultimate view to certain pence, sixpences, and shillings, must be directly injurious to the workman's own character, lowering him in his own esteem, and derogating, in no inconsiderable degree, from his respectability in the estimation of his superiors. We regard it in its least serious light, simply as unreasonable. The matter puts on a more serious aspect when we look at it, as we have strong reason to do, with regard to its normal consequences, as the A B C of a course of beggary. The tale of the officer who gave one of his men a sovereign to drink his health with, and was astonished to find that, in the man's anxiety to obey orders, he had drunk his health so assiduously for three or four days, as to be brought at last to the guard-room, and disgraced in his regiment, is one which is continually enacted. The money given and received in the manner to which we are alluding, is sacred to the alehouse, and to the fellowship of pot-companions; and the libations made at such a shrine, commenced under the sanction, authority, and recommendation of the donor, are perpetuated by the taste and newly-acquired habits of the recipient, until, in too many instances, they reduce him to rags, and his family to wretchedness.

We are here looking at the subject in a strong, but in by no means a singular light. We know many who deplore the necessity they are continually under, in order to avoid insult, of contributing to keep up a custom in direct opposition to their deliberate convictions; and we believe that few ordinary doings of the affluent classes are more injurious to the character and wholesome self-esteem of the humbler classes, than when, instead of reciprocating kindness for kindness, or expressing simply a sense of sincere obligation in return for a minor good office, they make unworthy, and, after all, inadequate returns of money. If brotherly-kindness be the bond of union among men, and a series of mutual obligations the links of that chain, can it be otherwise than that the rude attempt to cut asunder one of these links by the strong hand of money, will injure, if not loosen the rest? The example set by railway companies, in making a demand for money by any one of their officials a sufficient ground for his dismissal, is one which, if its principle were carried out in private life, would tend to the complete abolition of the nuisance; but we regret to add that, even at railway stations, in spite of the urgent request that no money should be offered, and the threat that its acceptance would be followed, if discovered, by immediate dismission, persons are yet found, on the one side, stimulated by a weak and foolish pride, to offer the temptation, and, on the other, sufficiently blind and unprincipled, for the sake of a few paltry pence, to hazard the security of an otherwise permanent and comfortable situation. We can vouch for the correctness of our assertion.

Like some diseased atmosphere, this custom has penetrated the remotest recesses of social life, spreading its infection on high and low, from the palace to the prison, in the streets, by the road-side, in the grand hotel, in the petty tavern, in the playhouse, and even inside the church-door; and though now and then some ultra-reformer of a commercial traveller, in a fretful letter to the Times, goes into an elaborate calculation of how much a-year the item of civility costs him, and denounces the whole host of waiters, and chamber-maids, and hostlers, and boots, and ostlers, and porters, spreading wild dismay throughout the hostels of our queendom; and though some Boanerges of a public writer hurls his thunderbolts at the stolid head of that sluggish giant, the People; and though some mighty preacher proclaims it, as practised within consecrated walls, to be on the one side an insult, and on the other a sin, like a noxious weed, it only springs up the ranker, whether it is cut up or cut down.

We cannot help believing that it is to the upper classes of society that the origin of the evil is attributable; and among them, its parent may be found in pride—we would not say an ungenerous, but a mistaken pride, productive of an unwillingness to receive the smallest assistance from the hands of an inferior, without the endeavour to return it. How salutary a sentiment under the control of a sound judgment—how unsalutary when misdirected! The error was mainly in the head. The dangerous consequences of introducing a species of moral barter were unforeseen, and no definite line was drawn between good offices costing the poorer man little, and those costing him much. Thus was the custom developed. How easy its conception, how rapid its growth, how ripe its maturity, when, lost to a sense of mutual esteem, the poor man renders, and the richer pays for, a civility whose venal character defiles its purity, and robs it of its value!

Thus neither is honesty nor civility suffered to be its own reward. Well might the (I believe) virtuous old man in 'The Mysteries of the Forest' exclaim, 'What! must I be paid for doing my duty?' Let us hope for the time when, under a second Lycurgan code, money will resume its proper level; when *pour l'amour de Dieu* and *pour l'amour d'homme*, will be tenfold more constraining motives to the relative discharge of moral duties, than heaps of silver or bags of gold; the time when there will be no more charges for 'fash,' no more touching of the forelock, and 'Please remember the boots, sir;' no more money-seeking officiousness of your host's lacquey, as he tenders your hat and gloves; no more the half-extended hand of the pew-opener, and the 'Would you like a seat nearer the desk, sir?'—the time—oh, Utopian dreamer!—when he who would offer

to pay by money for an act of humanity, performed from no mercenary motive, would be rebuked as one who had offered an insult to his fellow-man, and an injury to society; the time when civility shall have lost its venality, and when love shall be shown for love, and not love for money!

THE NEUVAINE OF THE CHANDELEUR.

A TALE—FROM THE FRENCH.

There is in country life a charm unknown to the inhabitants of large cities, particularly in early youth. A city life may be preferred in the age of activity of the passions, when the spirit of enterprise and the thirst for success animate the soul; but the country is the element of childhood and youth, where the tenderest and most exalted sentiments of the soul may unfold and expand. In the country, the familiar abandonment of the early relations of life is prolonged, without danger, till beyond the age when the least familiarity becomes dangerous and suspected among young people in large cities. In the country, habit prolongs those innocent pleasures, under the attentive eye of mothers, even in the ardent season of youth. One is already a man in mind, but a child still in tastes. At the age of eighteen I loved the fair young girls, amongst whom I passed the happiest hours of the day, with all the affection of a heart accustomed to love them, but without fever, without inquietude, and almost without preference.

On the 24th of January 1802, we were all assembled, as usual, before the hour of supper—for suppers were still in fashion—and were talking confusedly around our mothers, who were gravely conversing on matters not less frivolous. The question debated amongst us was the choice of a game.

'We should not be at a loss,' said the dark-haired Theresa, 'if Clara were come. She knows every game that has ever been invented; and when, by chance, she happens to forget, she invents one immediately.'

'Clara will not come,' said Marianne. 'I am sure of it; for this evening she commences the Neuvaine* of the Chandeleur.'†

'The Neuvaine of the Chandeleur!' cried I in my turn. 'I did not know she was so devout.'

'It is not for the sake of devotion,' said Emily with ill-natured gravity; 'it is through superstition or ostentation.'

'Through superstition!' replied Marianne; 'superstition indeed! The most whimsical, the most fantastical, the most extraordinary, the most extravagant——'

'But what is it?' I interrupted, laughing. 'You excite my curiosity without satisfying it.'

'Pshaw!' said she, looking at me with an ironical expression; 'it is too stupid for such a wiseacre as you. As for the rest, they are not ignorant, I imagine, that the Neuvaine of the Chandeleur is a particular devotion among young people of the lower classes, the object of which is—— How shall I tell it?'

'The object of which is?' murmured a dozen voices, whilst a dozen pretty necks were stretched towards Marianne.

'The object of which is,' resumed Marianne, 'to know beforehand what husband they shall have.'

'The husband they shall have!' repeated the dozen voices, with as many different inflections; 'and what connexion can the future husband have with an act of devotion like the Neuvaine of the Chandeleur?'

'You all know very well that I don't believe it,' she continued; 'and even if I did, I should not be the more anxious about it. What is it to me what husband I shall have, provided he be a man of honour, birth, and fortune? My parents will give me to no other; so I don't trouble myself about the matter so long beforehand.'

'Nor I either,' said Theresa, drawing her chair close to that of Marianne. 'But the spell?'

Impatience was now at its height, and that of Marianne was not less than ours; for she always took more pleasure in talking than any one else did in listening to her. Throwing a glance of satisfaction over her audience—'You must know,' she resumed, 'that there is no devotion more acceptable to the blessed Virgin than the Neuvaine of the Chandeleur; and on that account it is thought that she recompenses with peculiar favour persons who pay her that homage. But there are so many ceremonies in the experiment in question, that I am afraid I shall go wrong, if Emily do not give me a little help. She was with us the day that Clara told me all about it.'

'I!' returned Emily disdainfully—'I never take any part in your conversations.'

'I do not say you take any part in them,' replied Marianne, 'but you listen to them.' Then, after biting her pretty fingers for a little, she added—'The Neuvaine must be commenced this evening, by praying for eight hours in the chapel of the blessed Virgin. Afterwards, you must hear first mass every day, and return to prayer every evening with unabated piety and unshaken faith until the first of February. It is terribly difficult. Then, on the first of February, you must hear all the masses, from the first to the last, in the chapel. In the evening you must hear all the prayers, and all the instructions, without missing a single one. Stop, stop. I was near forgetting that you must also have confessed on that day; and if, unfortunately, you have not received absolution, all you have done will be labour lost; for the essential condition of success is, that you enter your chamber in a state of grace. Then——'

'Then you find the husband there before you?' cried Theresa.

'You are in a great hurry,' replied Marianne coldly; 'I am not yet through the half of my instructions. Then you again begin to pray: you shut yourself up, in order to fulfil the conditions of a severe retreat; you must be fasting, and yet have everything disposed for a banquet. The table must be laid for two persons, and furnished with two complete services, with the exception of knives, which must be avoided with the greatest possible care. I need not tell you that the table linen must be perfectly white, and as clean, as fine, and as new as can be got, that good order and good taste may reign in the little apartment; for these things are always attended to when a person of consideration is expected. The repast consists of two bits of consecrated bread, brought away from the last mass, and two glasses of pure wine, placed of course at opposite sides of the table. Only the middle of the service is garnished, if possible, with a porcelain or silver dish, which contains two sprigs (carefully blessed) of myrtle, rosemary, or any other green plant—boxwood excepted—placed side by side, not crosswise. This also is a point which it is essential to observe.'

'Then?' asked Theresa, and the whole circle repeated the question like an echo.

'Then,' replied Marianne, 'having opened the door, that the expected guest may enter, you take your place at the table, devoutly commend yourself to the protection of the Virgin, and go to sleep, in expectation of the effects of her favour, which never fail to be manifested according to the person who implores them. Then begin strange and wonderful visions. Those for whom Heaven has prepared on earth some mysterious sympathy, see the man appear who is to love them if he meet them—who would have loved them, at least, if he had met them: the husband they should have, if favourable circumstances brought them together. It is also pretended, for a positive fact, that the Neuvaine has the peculiar privilege of causing the young man of whom one dreams to dream the same thing, and inspiring him with the same desire to find that half of himself which has been revealed to him. That is the bright side of the experience. But wo to the young girls whom Heaven has neglected in the distribution of husbands, for they are tormented with frightful prognostics! Those who are destined for a convent, see, it

* *Neuvaine*, a nine-days' devotion. † *Chandeleur*, Candlemas.

is said, a long procession of nuns, chanting the hymns of the church, slowly defile before them. Others, who are to die before the time, are present at their own funeral, the sight of which freezes the blood in their veins. They are awakened with a start by the light of funeral torches, and the sobs of their mother and friends, who weep over a coffin hung with white.'

'I solemnly declare,' exclaimed Theresa, 'that I will never expose myself to such terrors. It makes one shudder even to think of them.'

'You might, notwithstanding, expose yourself to them without fear,' replied Emily. 'I warrant you would sleep soundly till morning, and should be wakened as usual to take your Italian lesson.'

'That is my opinion too,' said Marianne; 'and I should be very much astonished if it were not also that of Louis, who seems buried in his reflections, as if he were trying to explain a difficult passage in some Greek or Latin author.'

'I don't know,' I replied; 'and you will excuse me if I do not pronounce judgment so hastily on a belief supported by the testimony of the people, whose opinions are generally founded upon experience. But pardon, dear Marianne, if the details you have just given, with your usual grace, have left me still something to desire. In your recital you have mentioned young girls only as being benefited by the effects of the Neuvaine of the Chandeleur. Do you think that the Virgin does not grant the same favours to the prayers of young men?'

'By no means!' she exclaimed; 'and I beg pardon for being so remiss. The Neuvaine of the Chandeleur, performed with this design, has the same virtue with respect to all unmarried persons, without distinction of sex. Would you have any strong desire to try it?'

'Truly,' said Emily, 'it would be a fine thing to see a rational young man, accustomed to the society of men of learning, and whose father was the friend of M. de Voltaire, giving credit, like an ignorant child such as Clara, to such shameful folly.'

I made no reply, but rose quietly, under pretence of suddenly recollecting some engagement; and gliding gently from chair to chair behind the elder ladies, I seized my hat, and ran to the chapel of the Virgin to commence the Neuvaine of the Chandeleur; for, in truth, I saw no plausible reason against it. 'Why,' said I to myself, when I had proceeded some steps towards the church—'why may it not be so? Nature has twenty mysteries more marvellous than this, and no one doubts them. Gross and apparently insensible bodies have affinities between them, which attract them to each other through incalculable space. The magnet, if consulted under the equator, recognises the pole; the newly-hatched butterfly flies unerringly towards his unknown mate; the pollen of the palm-tree goes upon the winds of the desert to impregnate the solitary flower that awaits it. And is it prohibited to man alone, otherwise so privileged, to foreknow his destiny, and to join himself to that essential part of himself which God has prepared for him in the treasures of his providence? To believe in such neglect, would be a calumny against the power and goodness of the common Father.'

I had fulfilled all the obligations of the Neuvaine; and after having finished my preparations, I opened my door to the approaching apparition, and had hardly regained my arm-chair, when I was surprised by a most profound sleep. I know not how long it lasted; but it suddenly seemed to me that I had ceased to sleep. My chamber resumed its usual appearance by the vacillating light of the candles. I distinguished every object—the slightest noise. Hearing a slight murmur, like that caused by the motion of a plume of feathers, I looked towards the door, and saw a female enter. I wished to rise and receive her; but an invincible power retained me in my place. I tried to speak, but the words remained glued to my tongue. My reason was not lost in this mystery. I felt that it was a mystery, and that the prayers of the Neuvaine had been heard.

The unknown approached, without seeming to perceive me, as if she had obeyed a kind of instinct, an irresistible impulse. She seated herself in the arm-chair which I had prepared for her, and, with downcast eyes, remained thus exposed to my view. I certainly had never seen her before, and I felt, in the vague consciousness of a dream, a conviction that this existence, strange as it was to all my recollections, was not the less living and real. I will not speak of the beauty of this female; portraits cannot be drawn with words; I have often doubted whether they can be with colours. I did not ask myself why I loved her; I knew that I loved her; for it must be recollected that the apparition of the Chandeleur is conjured up only through a complete and absolute sympathy between the persons whom it brings into *rapport*.

The stranger seemed to be dressed, like myself, for a bridal feast; but her garments were not familiar to the brides of my province. They recalled to my mind those I had often remarked, in similar circumstances, in a town at some distance. It was the graceful costume of Montbéliard, which the highest society in the country still preserved by tradition, in certain solemn ceremonies, and which is probably now abandoned by the people themselves. She had placed beside her, on the table, one of those little bags in which young ladies keep those trifles which they are pleased to call their work, and on the steel-clasp of which I perceived two letters engraven, which must have been the initials of my future bride. At length her eyes met mine. I could scarcely support the fascination of that heavenly look. Never did the fire of innocent affection animate eyes more lovely, nor better reveal those secrets of pure love for which no human voice can find words. A strange cloud, however, suddenly darkened her brow; her bosom palpitated; her eyelids became moistened with tears, which she tried to restrain. She gently pushed away the bread and wine which I had placed before her, took one of the sprigs of consecrated myrtle, and slipped it under one of the knots of her bouquet. She then rose, and departed by the way she had come. I was then relieved from the horrible constraint which chained me to my seat, and I darted after her, to obtain one word of consolation and hope. 'Oh! whoever you are,' I exclaimed, 'abandon me not to the terrible regret of having seen you, and never being able to find you out again! Think that my future happiness depends on you, and make not the sweetest moment of my life an eternal misfortune! Tell me, at least, I implore you, whether I shall again press this hand which I bedew with my tears—whether I shall see you again?'

'*Once* more!' she replied; 'or never! never!' she repeated with a mournful cry, and vanished.

I felt my strength fail, and my limbs sinking under me, and was obliged to lean on a chair for support. At this point I was awakened to broad daylight by the bursts of laughter of a servant, who was removing the preparations of my nocturnal collation, and which he attributed to the fantasies of somnambulism—to which, indeed, I was subject.

I was not of a character easily to lay aside ideas with which I had once been strongly impressed. This unknown female, whom I loved with all the strength of my heart, even to distraction, and who perhaps was not in existence, became my fixed idea—the only thought of my life. I shunned society, and sought for solitude; because it was only when alone that I could freely indulge in the contemplation of my wishes and hopes. To what friendship, or to what complaisant credulity, could I have dared to confide them? I imagined that some unforeseen circumstance would shortly bring me in contact with my visionary betrothed. I expected her. I fancied I should find her in every strange female whom I saw at a distance; but she always escaped me, like the dream in which I had seen her. My reason and health sunk under this perpetual succession of powerful emotions. The physician, vainly called to my bed of grief, in a few days gave up all hope of me. In

the meanwhile, I had neglected no means to discover my mysterious friend. Under the seal of profound secrecy, I communicated to a schoolfellow of mine, who lived at Montbéliard, the initials of the bag, with a most circumstantial portrait of the young girl whose name they were meant to express.

The reply came at length to cheer my heart, in one of those moments of extreme anguish when my exhausted strength seemed no longer able to struggle against death. The ideal being of whom I dreamt on the night of the Chandeleur really existed! The resemblance was perfect, even to a small mark on the back of her neck, which I had noticed in her retreat. Her name was Cecilia Savernier; and these names corresponded with the letters I so well remembered to have seen on the steel-clasp of the bag. She usually resided with her father, in a mansion situated at some distance from the town of Montbéliard, where her beauty and virtues were the theme of every conversation. Thus my illusion assumed a body; my chimera became a reality; my languor disappeared with my anxiety; my health improved; and my father rejoiced in the certain hope of my recovery.

One day my father entered my room, which I had not yet left. 'Heaven be praised!' said he, affectionately pressing my hand; 'my son is restored to me.' After a few minutes' silence, he added, 'Louis, I am come to speak to you on a subject which I have much at heart —your marriage.'

I looked at him in surprise. 'Don't you think, father,' I replied, 'that there is still time enough to trouble ourselves about that? I am not yet twenty.'

'It is a matter which concerns you deeply,' he returned; 'and why not? I married too late, or else the years have passed away too quickly; and I should lose one of the sweetest enjoyments of life if I died before having been loved by a daughter whom you should have given me, without having played with your children, without leaving behind me the remembrance of my features and affection to a new generation. This, my son, is the *material* immortality of man, which alone the weakness of our organs and intelligence permits us to foresee clearly. The other is a great mystery, which religion and philosophy prudently abstain from attempting to explain. Your marriage, then, has become, for your own sake, the principal object of my thoughts and hopes; however, I do not wish to put any force on your inclinations, but leave you perfectly free in your choice and establishment; and I shall never depart from this promise.'

'You overwhelm me with gratitude and joy!' I exclaimed, embracing him. 'On my side, I swear to you that I will never bring a daughter into your house whom you will not have adopted beforehand.'

'As you will,' said my father; 'however, this idea which I must now sacrifice to you was the sweetest dream of my old age. Suffer me to speak of it to you for the last time. I have perhaps never mentioned before you the name of one of the friends of my youth, the remembrance of whom recalls the only real friendships we generally enjoy in this life—the sincere and disinterested friendships of the college. Though a great difference of vocation, habits, and abode, seemed to have separated us for ever, yet I have never forgotten him. He became a colonel of artillery. He emigrated, and this circumstance rendered our separation irrevocable; for I, like many others, had followed the movements of the Revolution, when I was far from perceiving its aim and results. This transitory direction of a mind deceived by appearances, gave me a political credit which I have had the happiness of seeing sometimes useful. My friend, undeceived in his turn from another kind of error, sighed for his country, always so dear to every well-constituted heart. I succeeded in obtaining his eradication,* in restoring him to his hearth, his paternal fields, and native air. We have not seen each other since, but his letters cease not to testify an affectionate gratitude, which sweetly repays me for my efforts in his behalf. Mutual confidence has made us acquainted with the most trifling particulars of our inmost thoughts and fortune. My old friend Gilbert knows I have a son in whom I repose all my hopes of the future. He has a daughter whose praise is in every mouth, and who will certainly make her husband as happy as she has made her father. I do not conceal from you that we had seen in this projected union an agreeable means of reuniting ourselves for the remainder of our days. It was a life we had fondly planned in our foolish confidence; so true is it that we deceive ourselves at every age, and that old age, matured by experience, is as apt to give way to illusions as youth itself. This prospect was delightful! It must be renounced!'

'Pardon, my father; a thousand pardons! Why has Heaven condemned me to acknowledge your affection so badly?'

'Never mind,' said he; 'I shall easily forget the joy I promised myself in seeing my hopes realised by thinking of yours. After all, it is a pity, for Cecilia Savernier is considered a handsome girl in a country where it is difficult to choose——'

'Cecilia Savernier!' I cried, jumping to my feet; 'Cecilia Savernier! Oh, father! have I heard you rightly?'

'Perfectly,' said he. 'Cecilia Savernier, daughter of Gilbert Savernier, late colonel of artillery, residing at Montbéliard, department of Mont-Terrible. It is of her I spoke.'

I fell at my father's feet in a state of agitation impossible to describe. Unable to utter a word, I covered his hand with kisses and tears. My father raised me anxiously, pressed me to his bosom, and asked me what was the matter more than ten times before I had power to answer. 'Cecilia Savernier! 'Tis she; 'tis she, father!' I cried with a choking voice. ''Tis for her I ask you on my knees!'

'Indeed,' he replied; 'then your prayer is soon heard, since the affair is nearly all settled. But where can you have seen Cecilia? Or where can she have known you? Montbéliard is the only town in France she has appeared in since her return from abroad. And when you were in that part of the country two years ago, I am positively certain she was not yet there.'

I blushed. This question touched too nearly on a secret which I had not strength of mind to reveal, and which my father might regard either as an illusion or a falsehood. 'Believe,' I replied, 'that I have seen Cecilia, and have reason to think that she will not be unfavourable to my love. With respect to the circumstances or accident that brought us together for an instant, be so good, I beseech you, as not to question me further.'

'Heaven forbid!' said he, embracing me. 'I have too much respect for this kind of mystery to take from you the merit of discretion. There are secret links, sympathies, known only to lovers, which one at my age can but ill discern. This state of things accords so well with my wishes, that I have no desire to find out how it originated. Let us now think only of your marriage, which will be celebrated without fail after you shall have taken your degree. This delay seems to frighten you; but it is not so long as you imagine. You will soon regain the time you have lost during your illness. You must feel that it would ill become you to present yourself at the most solemn act of life, without bringing as a dowry an honourable and serious title. Besides, it is but proper that you should first see your intended wife and father-in-law, and obtain a more positive consent than that on which we have been flattering ourselves, before pushing things any further. As your health is so much improved, I trust that a month's residence at Montbéliard will quite re-establish it. You will be present at your cousin Clara's wedding as you pass, for she lives half-way, at the Bois d'Arcey.'

* Getting his name struck off the list of the proscribed.

'Clara's wedding!' I exclaimed in surprise. 'Is Clara going to be married?'

'Yes,' replied my father. 'I wish she may be happy; though there is something extraordinary about the whole affair. This year she refused three highly-advantageous offers, and her mother thought she was disposed to embrace a religious life, when a strange young man, who had arrived in town only a day or two before, obtained her consent in their first conversation. The references he gave as to character and fortune were satisfactory, and their two families promptly agreed to the match. Clara is happy in this union, which the Virgin, she says, had in reserve for her since the night of the Chandeleur. But what say you? Does the arrangement I have proposed suit your inclination?'

I threw myself into his arms; he kissed my forehead, went into his study, and soon came out with a letter in his hand, addressed to Colonel Savernier. Next morning I set out for Montbéliard, happier than I can express.

Alas! what are human joys!

I have said that the strange illusion that filled up my whole life, and absorbed my every thought since the night of the Chandeleur, had to me become equivalent to the most positive truth. The result of my inquiries had given to it an extreme likelihood. The unforeseen concurrence of my father's projects with the time and circumstances of my dream, distinguished it from the class of ordinary dreams. It was no longer a dream—it was a revelation. Constitutionally disposed to be easily impressed by the marvellous, I abandoned myself to this without resistance. Hearts that resemble mine will have no difficulty in understanding me. I embraced, for the first time, the thought of a happiness which I imagined nothing was to disturb. I flew towards Cecilia in all the confidence, all the abandonment of my heart. It was at the end of January; and I was struck with a strange sensation when I remarked that Clara's marriage was exactly on the day of the Chandeleur. I arrived in time to be present at the ceremony. The countenances of the bride and bridegroom expressed the most perfect happiness. The young man was handsome, affectionate, and engaging, but serious in his demeanour. When the ceremony was ended, I approached my cousin, and pressing her hand to my lips, whispered, 'I hope, my dear friend, that this gentleman is the husband who was revealed to you on the night of the Chandeleur?' Clara blushed, and gave me a look which seemed to say, 'How do you know that?' Then pressing my hand, she replied, 'I would not have married another.' I felt myself agitated by a delightful emotion, impossible to describe, in thinking that a similar happiness awaited myself.

Whilst the fêtes of Clara's marriage detained me at the Bois d'Arcey longer than I could have wished, my excellent father had advised Colonel Savernier of my intended visit; of which the latter, curious to know me first, did not think proper to inform his daughter. When I had presented my letter to the colonel, he merely glanced at it with a smile, and coming to me with open arms, 'I need not ask your name,' said he with affectionate cordiality; 'you bear so strong a resemblance to the friend of my youth, that I think I see him still, as when every morning brought us together—only you are a little taller. You are welcome, my dear boy, as a friend—as a son—if, as I hope, your heart and that of my Cecilia's come to a mutual understanding. And now, sit down and rest yourself, while I read your father's letter, and consider you more at my ease.'

The kindness of this reception brought tears to my eyes, which I sought to restrain by taking a survey of the room. A straw-hat, trimmed with blue ribbons, hung upon a nail: it was Cecilia's. There was a harp in one corner of the room: it was Cecilia's harp. A bag had been carelessly left upon a chair close to mine, on the steel-clasp of which my eye quickly detected the initials that had struck me on the night of my vision. Yet the idea suddenly occurred to me, what if Cecilia was not the right person after all? The thought froze me with terror. I found myself engaged in the most sacred, the most irrevocable manner, by the wishes I had expressed to my father, by my present proceedings with respect to M. Savernier, and my blind precipitation was perhaps about to separate me for ever from the bride who had been promised me. A mortal shudder ran through me when I perceived, at a distance, the portrait of a young female wearing a straw-hat. I collected all my strength, and hastened across the room to examine it more closely. I was struck with despair. It was the portrait of a charming woman, but whose face bore no resemblance to that of my imaginary Cecilia. It was not she! My limbs were sinking under me, when the arm of M. Savernier, passed round my body, held me up. 'Alas!' said he, wiping away a tear, 'you will never see her! That is Lidy! my fair and gentle Lidy! the mother of our Cecilia. May you never experience the grief of surviving what you love!'

My terror vanished, leaving only a profound sympathy for my friend, who seemed to appreciate my feelings, for he said, 'Yes, you shall be my son! for you have a soul! You shall be the husband of Cecilia, if she consent. And why should she not?' After a pause, he added, 'My dear young friend, a regard to propriety will not permit that you should stay at my house; but we shall see you every day while you remain at Montbéliard, before going to resume your studies. The sweet intimacy that ought to precede a serious and inviolable engagement will grow up of itself. One ought not to proceed lightly with affairs of life and eternity. But I learn with much surprise, from your father's letter, that you already love my Cecilia; and, what is still stranger, if it be possible, her artless heart, which has never concealed anything from me, feels drawn towards you by the same inclination, though you have never seen each other; unless, indeed, my vigilance has been deceived by some of those artifices which youth practises by instinct, and old age forgets. That, I own, is a point on which I am anxious for an explanation; and my friendship for you gives me some right to expect it.'

The colonel cast a searching look on me; and the trouble into which his question plunged me could not have escaped his notice. I cast down my eyes, hesitated, and vainly sought for an answer.

'I swear to you, upon my honour, sir,' I at length replied, 'that I have never seen Cecilia; that I have never seen her portrait; that I have never presumed to write to her; and that her name was known to me scarcely two days before my father mentioned it to me. Notwithstanding, it is a year since I first loved her; and I will love her all my life. There is the truth, sir. The rest is to me an incomprehensible mystery.'

'Incomprehensible indeed!' replied M. Savernier with an anxious air—'quite incomprehensible; for I do not suppose you could be guilty of a falsehood. And yet——'

'And yet I have disguised nothing from you. Is it not an instance of those mysterious sympathies which sometimes unconsciously take possession of us, and carry us away with all the vehemence of a passion? It is what I am profoundly ignorant of; however, I must believe it, for I have no other explanation to give you.'

'Pshaw!' replied the colonel; 'you will next have me believe that you have seen and loved each other in a dream. If the secret of that kind of rendezvous get abroad, it will be all over with paternal surveillance. But what matters it, provided you love each other?—just as I wish things to be. This is what we shall all know before long in a more positive manner; for you shall dine to-morrow with Cecilia.'

'To-morrow!' I exclaimed, in a tone of disappointment.

'To-morrow,' said he, smiling. 'It is not so soon as you would wish; but the delay is not long enough to cause you any real affliction. I have not told Cecilia of your expected arrival. I reserved to myself the pleasure of discovering at your first interview, when I had

known you a little, whether there is any reality in the sympathy between you; and I was not sorry that an opportunity offered to get my daughter out of the way at the moment I expected you. A country family, in which Cecilia counts no less than six friends—all sisters—solemnise to-day the anniversary of the birth of their excellent grandmother, who is an old friend of mine. As the long retirements of the Chandeleur are over, and the rest of the time between this and Lent is, by immemorial custom, consecrated to amusements more or less innocent, but which religion itself does not forbid, they dance, they disguise themselves, and I even believe they will be masked. Don't be alarmed, my friend; the programme of the fête admits females only, nor will any man be received there, whether father, husband, or brother, till the hour appointed for the sweet lambs to return to the fold. Meanwhile we shall dine *tête-à-tête*, for there is Dorothy calling us.'

'Do you know,' said he suddenly, when we were about to leave the table, 'an idea occurs to me. Since to-morrow seems so long to your impatience, we shall at least try to deceive *her* till then. I shall tell you how. At the hour of breaking up this evening, you shall accompany me when I go for Cecilia. I shall enter alone, and in a few words smooth all difficulties. A servant, at my appointed signal, will introduce you as a friend of the family. We must seem to be entire strangers to each other. In this way I shall be enabled to appreciate the reality of those marvellous sympathies you speak so much of; for there will be nothing to prevent you, if not from seeing Cecilia, at least from conversing with her without restraint. I hope you will have no difficulty in distinguishing her in her disguise as a bride of Montbéliard.'

She is disguised as a bride of Montbéliard, say you? Can it be possible?'

'Why, yes; as a bride of Montbéliard,' he replied. 'It is a good omen, is it not? But this costume is so graceful, that more than one of her companions may have also chosen it. In that case you will know her from the others by a little sprig of myrtle, separated from her bouquet, which she took a fancy to attach to her bosom, and by which I am myself to recognise her.'

This second circumstance, which recalled so vividly the particulars of my dream, renewed my emotion; but I soon mastered it, and answered to the proposal of M. Savernier by testifying the most tender gratitude. An hour afterwards, he had executed his project in all points, and I was in the presence of Cecilia, whom I easily recognised by the tokens her father had given me. On her side she had shown some emotion at my approach, and when I had taken my place beside her, I thought I perceived her tremble. 'Excuse,' said I, 'a liberty which the mask and disguise will in some degree explain. The vicinity of a stranger may perhaps be unpleasant to you; yet I doubt much whether my features are wholly strange to your recollection?'

'Indeed,' she replied, 'I do not think I have had the honour of ever seeing you before.'

'Never?' said I.

'Never,' she returned with a forced laugh, 'unless it was perhaps in a dream; and you may believe my word, for I am incapable of feigning. I have not even tried to disguise my voice.'

It was indeed the voice I had heard a year before, and which still echoed in my heart. 'Permit me, then,' said I with warmth, 'to seek some motive which may supply the pleasing customs of established acquaintanceship. My name, or rather that of my father, must have often been mentioned to you by yours, and I am not ignorant that I speak to the daughter of M. Savernier. Would this name be happy enough to awaken any kind of sympathy in your soul?'

I had hardly pronounced my name, when Cecilia started, and turned on me a look expressive of tenderness, mingled with terror. 'Yes, yes!' she replied; 'your name is well known to me. It is dear to my father and to me also, for it recalls to us recollections which are never effaced from an honest heart—those of gratitude! It is true, then?' she continued, speaking to herself, as if she had suddenly forgot my presence; 'it was not an illusion? All has been thus far fulfilled—all will be fulfilled without doubt! The will of God be done!' And she fell into a state of gloomy dejection, in which all her ideas seemed to be absorbed. One of her hands nearly touched mine. I took it without her making the slightest effort to withdraw it. She only looked at me more attentively. 'It is he!' she said.

'Oh, let not the sight of me give you any alarm!' said I, pressing her hand. 'The sentiment which has led me to you is as pure as your own heart, and it has the sanction of a father whose only thought is your happiness. You are free, Cecilia; and our future destiny depends only on you.'

'Our future destiny depends only on God,' she replied, letting her head droop with a deep sigh. 'But you have spoken of my father. You have surely seen him? He knows that at this hour of the night, for some time past, I suffer from an inexpressible affection which stifles and kills me. I wished so much to prevent its approach! How is it that my father is not come?'

Although the colonel had told me something of this circumstance, which inspired no fear, the expression of suffering that accompanied those words froze my blood. Besides, her father was standing before us at the moment that she seemed to be seeking him through the room with an uneasy look. I was surprised that she had not seen him. 'I am near you,' said he, encircling her with his arm, for she was going to faint. She leant upon him, and passed one of those moments so long to pain.

The friends of Cecilia had gathered around her, and, in the cares they lavished on her, displaced her mask. Alas! all my doubts were dissipated; but a frightful pallor covered those features so dear to my memory. I felt as if life was about to leave me, when Cecilia breathed, raised her head, and looked at the persons who surrounded her. 'Ah! all is well now,' said she. 'I am better. I no longer suffer. I ask pardon, and thank you all. This crisis is never long, but I would have wished to have spared you the pain of witnessing it. In that case I should not have come, or have gone away sooner. I will no longer interrupt your pleasures; the air and a walk will complete my recovery.'

Shortly after we set out, and M. Savernier intrusted his daughter's arm to me. She was near me—close to my heart. I conversed freely with her. I spent ten minutes of the fullest, the purest happiness that ever mortal was permitted to enjoy on earth. Cecilia walked with a light and firm step. She seemed happy. Her father, with one arm passed round her, congratulated himself on seeing her so well, and attributed her late illness to the fatigue of dancing, or to some sudden emotion, the secret of which he gaily refused to penetrate. The space we had to walk was very short. We arrived. 'Adieu till to-morrow,' said the colonel—'till to-morrow! To-morrow, the fairest day of all our lives, if my hopes be not deceived. But the night is past, and this fair to-morrow must be near its second hour. At four o'clock in the evening,' said he, embracing me; 'and this time we shall all three sit down to table. Sleep, the toilet, and hope, will help to shorten the time till then.' They retired. I still hear Cecilia's adieu.

Next day was Sunday. The hour so impatiently expected at length arrived—the hour at which I was to see Cecilia! Cecilia, by whom I believed myself loved! Cecilia whom I adored! The street through which I had to pass, and which I had seen nearly deserted the evening before, was now filled with people. I attributed this difference to the solemnity of the day; but I could not explain why the crowd formed itself here and there into motionless and silent groups. I rapidly threaded my way through those little assemblies, and only by chance caught a few confused words to the following effect:—'An aneurism?' said one; 'persons do not die of aneurism at that age.' 'One dies when the hour of

death is come,' replied his neighbour. A little farther on was a young girl, adorned and veiled, to whom one of her companions was listening in tears. 'At half-past two, when leaving the ball, she said truly that she would never be married!' A horrible light glanced in upon my mind. I was not more than twenty steps from the house. I ran. The many years which have elapsed since then cannot weaken the impression of that fearful moment. The door was hung with white; in the passage was a coffin, surrounded with torches.

'Who is dead? Who is dead in this house?' I exclaimed, violently laying hold of the arm of a man who seemed to have charge of the preparations.

'Mademoiselle Cecilia Savernier!'

DR MANTELL ON ANIMALCULES.

We quote below the title of a recent volume by Dr Mantell,* the object of which is 'to present a familiar exposition of the nature and habits of some of the invisible beings which people our lakes and streams.' Invisible beings! and yet not the creatures of superstition and dreamland, but actual substantial existences, that, unseen by the eye of sense, perform, within a single drop of water, the circle of an economy as perfect in its kind as is that of man himself. The object is in the highest degree commendable, and the name of the author is guarantee sufficient for its correct and agreeable treatment. There is no branch of science more interesting, none whose revelations are more wonderful, than that which unfolds the forms and nature of the minute creatures which people every stagnant pool, inhabit the leaves of every forest, and which take up their abode even in the fluids and tissues of other living beings. Nor is it a study the result of which is merely amusement and wonder; for, like the minute parasitic vegetation whose growth absorbs the elements of decay, and which occasionally create such havoc among human food, and engender disease and death, the myriad animalcules in nature may execute similar missions, sometimes repressing putridity, at others becoming the sources of the most loathsome and fatal diseases. It is, therefore, only by a knowledge of the nature of these creatures, and of the causes and sources of their development, that man can call in their aid or control their results, as his purposes may demand. So simple, moreover, and so easily discernible is the organization of many animalcules, that the physiological functions of their structure is fully exposed to view—functions which find their counterparts in the higher animals, but in whom the mode of operation is hopelessly obscured. Apparent as are the advantages resulting from a study of microscopic life, it must not be supposed that the little work before us either affords an ample exposition, or adds new discoveries to the subject. All that is attempted, is a familiar description of a few common facts, a description which will in some degree instruct the ordinary reader, and lead him—if he can be led at all—to further investigation, while works of greater research and higher pretensions would have been unintelligible and forbidding.

Dr Mantell's idea is a happy one: he takes a little water from a neighbouring pool, and confining himself to the examination of this, describes, in simple but attractive terms, what he sees, figuring at the same time, with the greatest delicacy and elegance, the objects of his observation. 'From some water containing aquatic plants, collected from a pond on Clapham Common, I select,' says he, 'a small twig, to which are attached a few delicate flakes, apparently of slime or jelly; some minute fibres, standing erect here and there on the twig, are also dimly visible to the naked eye. This twig, with a drop or two of the water, we will put between two thin plates of glass, and place under the field of view of a microscope having lenses that magnify the image of an object two hundred times in linear dimensions. Upon looking through the instrument, we find the fluid swarming with animals of various shapes and magnitudes. Some are darting through the water with great rapidity, while others are pursuing and devouring creatures more infinitesimal than themselves. Many are attached to the twig by long delicate threads; several have their bodies enclosed in a transparent tube, from one end of which the animal partly protrudes, and then recedes; while numbers are covered by an elegant shell or case. The minutest kinds—the monads—many of which are so small, that millions might be contained in a single drop of water—appear like mere animated globules, free, single, and of various colours, sporting about in every direction. Numerous species resemble pearly or opaline cups or vases, fringed round the margin with delicate fibres, that are in constant oscillation. Some of these are attached by spiral tendrils; others are united by a slender stem to one common trunk, appearing like a bunch of harebells; others are of a globular form, and grouped together in a definite pattern on a tabular or spherical membranous case for a certain period of their existence, and ultimately become detached and locomotive; while many are permanently clustered together, and die, if separated from the parent mass. No organs of progressive motion, similar to those of beasts, birds, or fishes, are observable in these beings; yet they traverse the water with rapidity, without the aid of limbs or fins; and though many species are destitute of eyes, yet all possess an accurate perception of the presence of other bodies, and pursue and capture their prey with unerring purpose.' To the uninitiated this must be a startling revelation; more wonderful, because real, than all the multitudes with which superstition and fancy have peopled the realms above, beneath, and around us.

The animalcules above enumerated now become the subjects of individual examination—there being nearly a dozen different genera in the small phial of water selected. The first and most conspicuous of these is the *Hydra*, or fresh-water polype, an animalcule visible to the naked eye, appearing, when at rest, a mere globular speck of jelly, but, when active, protruding into a funnel-shaped body, furnished with a number of long, delicate tentacula or arms, by which it secures its prey. This polype is carnivorous in its habits, feeding on small worms and insects. 'I have seen,' says our author, 'a polype seize two worms at the same instant; and to reach them, the arms were extended to such a degree of tenuity, as scarcely to be perceptible without the aid of a lens; and the worms, though very lively, and struggling violently, were unable to break asunder these delicate instruments, and escape, but in an instant were struck motionless. This phenomenon strikingly resembles the effect produced by the electric eel; and it is not improbable that the hydra, like that fish, kills its prey by an electric shock.' The fresh-water polypes are exceedingly prolific, several hundreds of thousands springing from one parent stock in the course of a few months. The generation or mode of multiplication in the hydra is one of its most striking peculiarities. In its ordinary condition, this takes place by gemmation, or buds, as in certain plants. A small protuberance appears externally on some part of the body of the polype, and gradually enlarges, and becomes elongated; arms speedily spring forth from the free extremity, and a miniature hydra is formed, which in a short time separates from its parent, and assumes its individual existence. Nor is this all: a single hydra may be cut into several pieces, either across its body, or longitudinally, and, what is wonderful, every section will in time become a polype, as perfect as the original of which it formed a part! Further, the animal may be turned inside out like a glove, and the original outer surface will perform the function of digestion, while the former lining of the stomach becomes the skin; and this without the creature apparently suffering any inconvenience.

From the examination of the *hydræ* or polypes, which are giants in comparison, Dr Mantell passes to the consideration of the true Infusoria—those minute animalcules which were sporting in the drops of water between the plates of glass placed in the field of his microscope.

* Thoughts on Animalcules; or a Glimpse of the Invisible World Revealed by the Microscope. By Gideon Algernon Mantell, Esq., LL.D. London: Murray. 1846.

'The existence of these minute beings having been first detected in water containing vegetable matter, such as hay, grass, &c. it was taken for granted that they were peculiar to certain infusions; hence the term *Infusoria*, given to this class of animals, in allusion to their supposed origin. This name is still employed as a general designation, although it has long been known that the presence of animalcules in infusions has no necessary relation to the vegetable ingredients, except so far as the decomposition of the latter may tend to the production of a proper medium for the development of the invisible eggs, or germs, of these creatures, which are everywhere present. The essential characters of the Infusoria—in other words, those points of organization in which they differ from all other animals—consist in their bodies being destitute of any true articulated or jointed limbs, and locomotive members or feet; their varied movements being performed by means of processes or filaments, which are always in motion, and are termed *cilia*, from their supposed resemblance to the eyelashes. The cilia, in many species of the Infusoria, are more or less generally distributed over the surface of the body; in others they are disposed in one or more circles around the mouth or aperture of the digestive organs; and in some, are arranged in zones on one or more circular or semicircular projections on the upper part of the body.' The examination of these minute creatures requires great tact and patience. From the original drop of water a particular species is first selected; it is then removed, transferred to a drop of pure water, and placed under the field of the microscope—the observer beginning with low powers, till he obtain a general knowledge of the form and appearance of the species, and afterwards examining the several parts of the body with the most powerful glasses.

By such a scrutiny, Dr Mantell detects, in the original glass of water, a number of species of the most beautiful forms, and of the most curious economy. Among these are *Monads*, animated spherules of various colours, little more than the thousandth part of a line in diameter; and yet each exhibits an individual activity, feeding, disporting, and propagating its kind with inconceivable rapidity. The floating coloured slime which sometimes appears in the water of stagnant pools, is an aggregation of countless myriads of these beings—not individually distinct, but visible only in the mass. There are also *Vorticellæ*, or bell-shaped animals, and *Stentors*, or those of trumpet shapes—fixed singly, or in clusters, by the narrow extremity, and waving in the water their wider extremities, fringed with cilia, like so many animated harebells of astonishing minuteness. The digestive organs of these tiny creatures 'consist of a series of globular stomachs—hence the term polygastria—connected by a common tube, which allows entrance to the food, and exit to the effete particles. The food is brought to the mouth by the currents produced in the water by the cilia; aëration is performed by the agency of the same organs; and the increase of the species is effected by spontaneous division, each part, like the severed portions of the polype, growing into a perfect individual.' Besides these polygastric animalcules, which are the lowest of the Infusoria, there are in the water under examination numerous species of *Rotifera*, or wheel-bearing animalcules, so called from the circular rows of cilia which fringe the upper parts of their bodies, and which, when in motion, appear like wheels revolving round a common axis. These are more highly organized than the former class: 'the digestive canal is a tube more or less straight, which in many genera is provided with jaws and teeth, which, like the masticatory organs in birds, are situated low down, are very distinct, and present considerable diversity of form and arrangement.' Jaws and *teeth* in creatures invisible to the naked eye! Yet so it is: like the miniature watch set in a finger-ring, its wheels and springs are not less perfect because of their tiny dimensions. In the Rotifera there are indications of nerves, muscles, and punctiform eyes, all shadowing forth, as it were, the dawn of higher existences. Some are oviparous, others viviparous—the eggs in many species being in size equal to one-third of the animalcule. These ova 'retain their vitality for almost an unlimited period, and are transported by the water and wafted by the winds—for, whether dry or moist, they remain uninjured—till, thrown into the conditions suitable to their organization, they become developed, and the apparently pure waters teem with myriads of highly-organized beings. Even the adult animals of some species—the common Rotifers, for instance—after being apparently dried up for several years, will start into life upon the addition of a few drops of water, and throw their rotatory organs into full play, as if roused from a refreshing slumber.'

Of these Rotifera, Dr Mantell detects several genera: some flower-shaped, *Floscularia;* some crown-shaped, *Stephanoceros;* the common wheel-animalcule, *Rotifer;* and other species covered with siliceous shells and spines, *Brachionus*. These last are perhaps the most wonderful, as they are, geologically speaking, the most important of their class. 'Their cases or shells consist either of lime, silex (flint), or iron; and these retain their form and structure for unlimited periods of time. From the inconceivable numbers of these shell-animalcules, which swarm in every body of water, whether fresh or salt, and the immense rapidity with which the species increase—by spontaneous fissuration, germination, and ova—extensive deposits, or strata of their cases, are constantly forming at the bottom of lakes, rivers, and seas. Hence have originated the layers of white calcareous earth common in peat-bogs and morasses, the tripoli, or polishing-slate of Bilin,* consisting wholly of the siliceous cases of animalcules, and the bog iron, composed of the ferruginous shields of other forms. In short, the extensive and important changes that have been produced on the earth's surface by this agency in the earlier ages of the physical history of our planet, and those of a like nature which are going on at the present time, are in the highest degree interesting, and have but lately become the subject of scientific investigation.'

The contents of the little phial have now been explored, the microscope removed, and all that remains is a small twig, two or three minute leaves, a few flakes of mucus, and a turbid condition of the water from the presence of earthy particles. 'All the diversified forms of life that were sporting in the apparently wide waste of water have vanished from our sight, and are as though they were not; yet what a world of wonders, what a marvellous display of Infinite wisdom, are there concealed! Within that narrow space, the microscope has shown us the mysterious principle of vitality embodied in structures of which we had previously no conception, and under conditions which, if estimated according to our experience of the visible creation, would appear incompatible with animal existence. Were we to describe the facts that have come under our notice to persons unacquainted with the optical powers of the microscope, and tell them that the seeming particles of earth in the water are creatures of various forms and structures, endowed with life, and the capacity for its enjoyment; that those flakes of mucus are aggregated thousands of animals, in the shape of flowers, which increase, like plants, by buds and by self-division; that some of these creatures are carnivorous, feeding on living atoms more infinitesimal than themselves; that others are herbivorous, and nourished by particles of decomposed vegetables too minute to be visible till accumulated in the internal organs of the animalcules; that we selected some of these animals, and caused them to swallow carmine, and thus imparted a red colour to their digestive organs, and rendered their structure more obvious; that some are free, and roam through the water at pleasure, others always sedentary, others locomotive in youth, and fixed to one spot in after-life; that many have eyes, the number and colour of which can be distinguished; that the difference in the relative magnitude of these creatures is as great as that between a mouse and an elephant; that if the water in

* The polishing-slate of Bilin, in Prussia, forms a series of strata fourteen feet thick, and is entirely composed of the siliceous shields of Infusoria, of such extreme minuteness, that a cubic inch of the stone contains forty-one thousand millions of distinct organisms.

which these beings are now immersed be allowed to evaporate, and the sediment become as dry as dust, and this be moistened three or four years hence, many of the individuals at this moment sporting through the water will be resuscitated, and appear in full activity, although, had they remained in their native element, the term of their existence would have extended but through a few days—thus realising one of the beautiful fictions of Arabian story—would not this statement be deemed unworthy of belief!—would it not be regarded as improbable and as extravagant as the wildest chimeras of the imagination! And yet such a narrative would be but the simple truth—an unexaggerated, unadorned matter-of-fact summary of the phenomena that have come under our observation!' Verily, there are more things in nature than the uninquiring dream of.

Like animals of higher organization, these microscopic creatures suffer and perish from sudden transitions of temperature. Atmospheric air is as necessary to their existence as to ours; and they are killed by substances which affect the chemical composition of the water. Fresh-water species instantly die if sea-water be suddenly added, though the latter may swarm with marine species; but they survive if the mixture be gradual; and many kinds inhabit brackish water. Infusoria always appear in vegetable infusions, because their ova or germs, being everywhere present, find in such fluids a proper medium for their development. Every stream is laden with them; every breeze wafts its myriads of myriads. Though the influence of light is favourable to their life, yet it does not appear indispensable, for they abound in the waters of deep mines, which are always in impenetrable darkness. 'The ordinary duration of life in the Infusoria varies from a few hours to several days, or even weeks. Rotifera have been traced to the twenty-third day of their existence. The death of these animals is generally sudden; but in some of the larger species, convulsive struggles attend their dissolution. Shortly after death, the soft parts rapidly decompose, and all traces of their beautiful structures disappear: the species which are furnished with earthy cases, or shells, alone leave durable vestiges of their existence.'

Such is an outline of Dr Mantell's 'Thoughts on Animalcules,' which we cordially recommend to the perusal of the young and intelligent. They may or may not become original inquirers—they may never adjust the focus of a microscope, or place one drop of an infusion under the lens of a magnifier—but this need not prevent them from making themselves acquainted, through the discoveries of others, with a department of knowledge than which we know of none more replete with interest and instruction.

FATHER BLACKHALL'S SERVICES.

SECOND ARTICLE.

The leading features in Father Blackhall's history, at least the sole ground on which his memory has been resuscitated by the printing of a substantial quarto volume, is the services he performed to 'three noble ladies,' as they are minutely set forth by himself. In the preceding article we have given whatever appeared curious or entertaining in his intercourse with the second of his noble employers. We now examine the third book of his circumstantial history, in the hope that it may provide some further incidents worthy of notice.

His former patroness, the widowed and lovely Lady Aboyne, on her deathbed earnestly recommended to Blackhall's protection her daughter, the Lady Henrietta Gordon. It is in the form of a letter to this lady that Blackhall describes his efforts to accomplish her mother's dying exhortation. His main object was to secure an appointment for the young lady in the household of the queen of France, the French court being then an asylum in which many of the decayed or oppressed aristocracy of Scotland found refuge. To pass over from the north of Scotland to France was a journey accompanied by no small array of perils in the early part of the seventeenth century; and it was not the less so, that the country was now raging from end to end with the troubles arising from the Covenant. The father had not proceeded many miles, before he encountered a rather formidable adventure. Along the north-west border of Aberdeenshire, where it marches with Banffshire, there is a wide, desolate moor, stretching over many miles of country to the foot of the mountain mass called the Buck of the Cabrach. It is a wild, dreary district at the present day, differing probably but slightly in its outward features from its state in Blackhall's time, however different may be the guests one would find in the primitive inn of Rhynie, which, when we last partook of its hospitalities, had as venerable an air as if it had been the actual house in which the following scene occurred. The narrative is, by the way, remarkable as illustrating the antiquity of *Finnan haddies*, which must have been a highly esteemed dish; otherwise they would not, as in this instance, have been conveyed inland nearly forty miles from the place where they were cured.

'Passing by the muir of Rhynie,' says Blackhall, 'I intended to give my horse a measure of oats there, because I had eight miles to ride over the Cushnie Hills, as wild a piece of ground as is in all Britain.' He then inquires of a man coming out of the inn if he would get good oats there; and 'the unhappy rascal answering, said, Yes, sir; and good ale and beer also; but did not tell me the house was full of men, as drunk as men could be.

'I entered in the court, suspecting nothing; and as I descended from my horse, a gentleman, called John Gordon, son to Leicheston, did embrace me very kindly. He was exceedingly drunk.'

Blackhall then enters into the hall with him, which hall he describes as being 'full of soldiers, as drunk as beasts, and their captain, William Gordon of Tilliangus, was little better;' adding, 'that Tilliangus had got a patent to list a company for the then holy, but now cursed, Covenant; and John Gordon of Leicheston was his lieutenant;' and hinting that every Covenanting man was then more loyal than the king himself.

Blackhall, when he went into the hall, kept his valise in his own hand, because there was in it a suit of mass clothes, which might have discovered him; and as he was about to salute the company, 'the captain, in a commanding way, said, Who are you, sir? which did presently heat my blood. And as I thought he spoke disdainfully to me, I answered in that same tone, saying, This is a question indeed, sir, to have been asked at my footman, if you had seen him coming in to you. He said it was a civil demand. I said it might pass for such to a valet, but not to a gentleman. He said it was civil, and I said it was not. Leicheston seeing us both very hot, and ready to come to blows, taking me by the hand, said, Go with me, sir, to a chamber, and let this company alone;' to which Blackhall agrees; but the captain follows them, refuses to drink with them, but sits down, and again reiterates his demand, when Blackhall tells him that, if at first the request had been made with kindness, it would have been complied with, but having been made in a disdainful manner, and refused, he could not now with honour grant it, lest it should seem that fear, not complaisance, had been the cause; adding, 'And I am resolved not to do anything prejudicial to my honour, neither for fear of death nor hope of reward; but at the next meeting, whensoever it is, I shall freely tell you, for then I hope our party will not be so unequal as it is now, and therefore will not then be ascribed to fear or baseness, as it is now.

'With this answer he went from us to his company; and, as we thought (that is, Leicheston and I), if not contented, at least paid with reason. In the meantime Leicheston did call for Finnan haddocks (or fish like whitings, but bigger and firmer). The mistress did give four to her servant to roast for us. When they were roasted, the captain did take them from her, and

ate them up, with his soldiers. The servant came and told us that the captain would not suffer her to roast any for us, nor bring us those she had roasted for us. Whereupon I said to the mistress, in great anger, Goodwife, I pray you give me some haddocks, and I will go into your hall and roast them, or some better thing for them, for I will not be so braved by your captain. My money is as good as his, and therefore I will have haddocks for my money, or know wherefore not. She said, You shall have, sir, but you shall not go in among them who are bent to kill you. I pray God deliver my house from murder. I would give all I have in the world to have you safe out of my house. I shall go and roast the haddocks, and bring them to you myself; which she did, and we did eat them, and drink to the health of one another without any trouble; for our resolution was taken, to sell our skins at the dearest rate that we could, if it behoved us to die; for Leicheston had already sworn to die or live with me.'

The captain is then represented as returning to them, sitting down and renewing his first demand, to which he receives the same answer, and departs in great wrath to his soldiers. Then Leicheston's servant comes and tells his master, in Irish, that they were making ready to compel Blackhall to tell who he was, or kill him; upon which Leicheston and Blackhall take measures for their reception. But the captain having delayed to come, Blackhall sent Leicheston to show him that it would be a blot against his honour to bring twenty men against two, and offering rather to fight with him hand to hand. Whereupon the captain was highly delighted with his courage, and said, 'I did never meet with a man of greater resolution, wherefore I shall honour him wheresoever I shall see him; and tell him I need not fight combats to show my courage: it is well enough known in this country where I live, and I believe so be his where he is known.' And shortly after the captain came to Blackhall, and said, 'I am come to crave your pardon for the affront that we have done. Good sir, said I, be pleased to change the name, and call it wrong, but not affront; for a man who is resolved to die in defending his own honour, may receive wrong indeed, but not an affront; and as to me, I never yet received an affront, nor do I think to be so base as ever to receive any.' Then, after further demonstrations of cordiality between Blackhall and the captain, the soldiers are brought in unarmed, to testify their friendship also; and Blackhall says, 'I did take each of them by the hand very kindly, and drank to them, and they to me. They were in all five-and-twenty; and a minister called Mr Patrick Galloway, who had been lately banished out of Ireland, in the insurrection that the Irish made against the Scotch in the north of Ireland; whereby ye may judge if I would not have been a good prize to these soldiers of the unholy Covenant. They would have been better rewarded for taking a priest nor [*than*] for a lord.' He then diverges to the praise of John Gordon of Leicheston, who had stood by him so stanchly in his extremity, saying, 'He was a very gallant gentleman, and as personable a man as was of any name in Scotland; tall, well-proportioned, with a manly countenance, which his generous heart did not belie. For without any other obligation, but only because he did casually meet me in the court, and civilly did bring me in by the hand to their company, he resolved to share with me of life or death, and did embrace my cause as if it had been his own; showing no less interest for my life than he would have done for his own.'

When the worthy father had accomplished the object of his mission, he joyfully prepared to leave France; but if, in his native country, he met with dissipated, quarrelsome people, he was exposed in that where he was now sojourning to greater danger from a multitudinous array of robbers. 'I passed on my way,' says he, 'asking in the villages, as I passed, if they did hear anything of voleurs [robbers] on the great way. Their answer was commonly, It is marvellous how you have escaped them, for the way is all covered with them. These were no comfortable news to me, who had all my money upon me in gold.' But if it was practicable for one man so to fortify himself as to be impregnable to multitudes, Blackhall had done so. Behold his account of his travelling arsenal. 'I had behind my saddle a great cloak-bag, in which were my new clothes and cloak, and a new hat; and at the top of my saddle two Dutch pistols, with wheelworks; and at my two sides two Scotch pistols, with snap-works; and a very wide musket, charged with nine pistol balls, hanging from my neck; and a good sword at my side.' It was not to be wondered at that, so accoutred, robber after robber passed him unmolested; but it must be remembered, that we have only his own word for the statement, that they had ever any design to meddle with him. The following is one of his escapes:—

'When I was passing Fleurie, the taverners, as their custom is, cried, Monsieur, we have good wine and good oats; will you give your horse a measure of oats? to whom I answered, My horse hath dined, and myself also: I will not light down. Then a strong, young fellow did come out of a tavern, who said to me, Monsieur, it is very dangerous for you to go through the wood alone in these times: if you will stay but a little, my master is in the tavern drinking a chopin with another gentleman; they will convoy you through the wood. I answered him, saying, I do not fear any man, neither in the wood nor out of it; and therefore I will not stay one moment for any company. I suspected that they might be voleurs; and he also then said, Since you have so good courage, I will go with you. The way, said I, is free to all men. But why do you not wait upon your master, to come with him, seeing, as you say, the danger is so great? Oh, said he, they are two, well mounted, and fear no voleurs. I believe you, said I. So we went on until we entered into the wood, and then my fellow redoubled his pace, to come nearer to me; which I seeing, turned the mouth of my musket towards him, and commanded him to stay there. Wherefore that? said he. Because I will so, said I: thou shalt not make me thy prey. Therefore, if thou advance but one foot, I shall discharge my musket in thy belly. He stood, and said, You need not fear, having so good a baton in thy hand. I fear no man, said I; but I will make thee fear if thou remove one foot forward until I be out of the wood. In the meantime I was ever advancing forward, and mine eye towards him. So, seeing that I did hold my gun bent towards him, he turned his back to me, and went into the thick of the wood, and I did not see him any more. Then the peasant, who all the time had kept a good distance from me, but so as he did both see and hear what was passing betwixt us, said, God be blessed, sir, who inspired you with His grace to distrust this voleur, and hold him back from you; for if you had suffered him to come near you, he would undoubtedly have got hold of your clothes, and pulled you down from your horse, and stabbed you. Behold, he is hiding himself in the wood: you have saved your own life and mine; for how soon he had killed you, he would have killed me also, for fear I might have discovered him hereafter.'

On his way back to Scotland, the father was wrecked on the coast of Holy Island; and he gives the following most expressive account of the state of society among a people who profit by shipwrecks:—'The country people convened the next day, to take the goods which the sea had cast to the land; amongst which there was a caseful of castor-hats, with gold hat-bands, for which the minister of the parish, a Scotsman, named Lindsay, and a gentleman dwelling near the island, did fight; and the minister did sore wound the gentleman; and the common people did get away the case, and broke it, and every one took away what he could get of it, whilst the church and the state were fighting for it in vain.' He then mentions, 'that the tempest having ceased, we went a-walking in the island, and did go to

the governor, Robin Rugg, a notable good fellow, as his great red nose, full of pimples, did give testimony. He made us breakfast with him, and gave us very good sack, and did show us the tower in which he lived, which is no strength at all, but like the watch-towers upon the coast of Italy. We did take him with us to our inn, and made him the best cheer that we could. He was a very civil and jovial gentleman, and good company; and among the rest of his merry discourses, he told us how the common people there do pray for ships which they see in danger. They all sit down on their knees, and hold up their hands, and say, very devoutly, Lord, send her to us; God, send her to us! You, said he, seeing them upon their knees, and their hands joined, do think that they are praying for your safety; but their minds are far from that. They pray God, not to save you, or send you to the port, but to send you to them by shipwreck, that they may get the spoil of her. And to show that this is their meaning, said he, if the ship come well to the port, or eschew shipwreck, they get up in anger, crying, The devil stick her, she is away from us!'

After a multitude of difficulties and dangers, which we cannot follow out in detail, the father returned with his ward to France; and here he found a new impediment in her intractable, haughty temper. With true Highland pride, the damsel thought that crowned heads were her only earthly superiors; and in the palaces of the French nobility, as different from her own rude home as a peer's mansion in London is from a farmer's cottage at the present day, her Highland blood boiled against the etiquettes and deferences to which the highest of the young nobility of France gave implicit obedience. Being placed in the family of the Countess of Brienne, to be trained for attendance at court, we are told that 'Both the count and countess, for the queen's sake, were very civil to her; but the more they honoured her, the less did she respect them. Whether that proceeded from pride, thinking that and much more was due unto her, or from inadvertency, not reflecting upon their civilities, which is called a kind of brutality, I know not; God knoweth. But what I have seen with my eyes, and heard with mine ears, that I write here, and nothing more; for I have seen my Lady of Brienne sit in her own carriage, without her gate, upon the street, fretting a whole quarter of an hour for Mademoiselle de Gordon, sending and sending over and over again for her to go to the mass; and which did highly displease me, when she was at the carriage, stepped into it, not opening her mouth to make any excuse for making the lady stay for her, no more than if she had been mistress of the carriage, and the lady but only her servant. This I have, with much grief, seen more than two or three times; and that lady did complain to me of her as often as I did go to see her.'

We must conclude with a specimen of the extremities to which the damsel's pride reduced her, notwithstanding the anxiety of her courtly friends to serve her; premising, for the reader's comfort, that the whole ended in her being received into the queen's household.

'When they arrived at St Germain, the queen knew not how to dispose of her, because the number of her filles [maids of honour] was complete, and Madame de Brienne would not meddle with her any more. The queen told her that she, having no vacant place for her, would place her with Madame la Princesse. She answered her majesty very courageously, saying she had never done anything to displease her relatives, who, she knew, would be highly displeased, hearing that she, who came to France to wait upon her majesty, had descended to serve the Princess of Condé; and prayed her majesty to excuse her, if she refused to do what her relatives would disavow in her. The queen did not take it ill of her, this her generous answer, but did pray monsieur the prince, and madame, to keep her with them as a friend, until she could take her to herself, which at the present she could not do. They, to oblige the queen, did accept of her as a friend, and made her sit at their own table, where she remained in that posture until the princes—to wit, Condé, Conti, and Longueville—were sent prisoners to Bois de Vincienne; and then the princess would not keep her any longer, but, a few days after their imprisonment, sent her to Madame de Brienne in a sedan; and Madame de Brienne would not receive her, but sent her to my Lord Aubeny, who sent her back to Madame de Brienne, and bade tell her that he had no woman in his house, and therefore could not receive her without disparagement of her honour and his. Madame de Brienne would not let her come within her house, but sent for Madame de Ferrand, a councillor's lady, and prayed her to take the young lady in her carriage, and deliver her to Madame de la Flotte in the Palais Royal. When they arrived there, it was near nine o'clock at night. Madame de la Flotte, seeing them come to her at that time of night, and thinking that this lady—to wit, Madame de Ferrand—had been but one of Madame de Brienne's gentlewomen, did claw her up soundly for bringing Mademoiselle de Gordon to her at that time of night.' But Madame de la Flotte, when she saw she was mistaken in the lady, asked her pardon, and showed her how she could not possibly receive Mademoiselle de Gordon that night, but would next day; and back she was taken to Madame de Brienne, who, late as the hour was, refused to let her in; and Madame de Ferrand was at last constrained to take her with her to her own house; Blackhall remarking, 'So Mademoiselle de Gordon might have learned, by Madame de Brienne's unkindness towards her, how improvident a thing it is to neglect powerful persons, able both to do good and evil.'

DR COMBE ON THE OBSERVATION OF NATURE IN THE TREATMENT OF DISEASE.

In the *British and Foreign Medical Review* for January last, the editor, Dr Forbes, presented an elaborate paper on Homœopathy, in which, while treating that novel system more liberally than is customary in the orthodox profession, he made such a number of admissions as to the state of ordinary medicine, as, coming from such a quarter, might well startle the public. We do not propose to say more on this paper at present, than that it meets but too aptly conclusions at which we have long arrived regarding medical practice. Our immediate aim is, to direct attention to a paper which the above has elicited from the pen of Dr Combe, and which appears in the number of the Review for April. This eminent person, as is his custom, takes the subject at once before the bar of nature. He sees disease to be 'a perverted state of a natural organic action, and not a something thrown into the system by accident, and obeying no fixed laws. In the cure of disease, therefore,' says he, 'the business of the physician is not to supersede nature, but carefully to observe what is wrong, and to aid the efforts made by her to re-establish regularity and order. Accordingly, experience shows that the physician and the remedy are useful only when they act in accordance with the laws of the constitution and the intentions of nature; hence in chronic, and even in acute diseases, the most effective part of the treatment is generally the hygienic, or that which consists in placing all the organs under the most favourable circumstances for the adequate exercise of their respective functions. If this be done systematically, every effort of nature will be towards the restoration of health; and all that she demands from us in addition, is to remove impediments, and facilitate her acts.'

The learned physician deplores that his medical brethren, in general, should look so much to what is called active treatment, and so little to hygiène, or the regulation of external conditions. He is not for leaving the patient to the efforts of nature, in the common sense of the phrase: he would take care neither to counteract her own efforts, nor to substitute another method of cure for hers. 'So far from sanctioning

inactivity on our part, an intelligent reliance on nature implies that we shall exercise, throughout the whole course of disease, the most watchful observation over its phenomena and progress, and not only timously remove obstacles which may interfere with its proper course, but rigidly fulfil all the conditions which a sound physiology shows to be most conducive to the well-being of the various bodily organs, and to their restoration when disordered. *In this way the physician may often exercise the most salutary influence, nay, even be the means of saving the patient's life, and yet not give one particle of medicine.*' It is first necessary that the physician should thoroughly know the laws of the healthy system; then, that he should observe the manner in which the various disturbing causes act upon the different functions, and the *kind, course*, duration, and termination of the morbid action which they produce; implicitly believing, and having ever present to his mind, that 'all the operations and actions of the living body, whether healthy or morbid, take place according to *fixed and discoverable laws*, and that God has left nothing to chance.' 'That there are,' he pursues, 'forms of disease in which a determinate nature and course cannot be easily traced, is quite true; but there are many more in which the natural course is as obvious as that of the sun. Take the familiar example of cow-pox, small-pox, fever, or ague. The disease is regulated by fixed laws in such a palpable manner, that every medical book describes, with perfect accuracy, the appearances which each will present on given days of its progress in an average constitution. The same holds with measles, scarlatina, and many other acute affections; and less clearly, but still perceptibly enough, with gout, rheumatism, and inflammation. All of these go through a regular course in a shorter or longer time; and when everything goes according to rule, we feel assured that the constitution is safer than where some unusual accident has interrupted the natural progress of events. This, be it observed, is the course towards health which the Creator, in constituting man, considered best for him; and the wisest thing we can do is to act in accordance with it, and seek only to remove impediments. It is not we to whom the cure is intrusted, or by whom it is effected. The Creator has perfected all the arrangements for that purpose, and our sole business ought to be to give these arrangements full play.' As an additional illustration, 'take even a severe cold, with which all are acquainted more or less. Everybody knows that when once set in, treat it how you like, it will run through a determinate course of increase, maturity, and decline; and that all we can do is to shorten a little the duration of its stages by diminishing its intensity, or lengthen it by increasing its severity. Occasionally, it is true, an incipient cold may be stopped by a "heroic" remedy, such as a tumbler of warm punch at bed-time; but much more frequently the heroics leave the patient worse than they found him, and the common experience of mankind shrinks from their use. Even a common boil on the fingers runs through its regular stages of inflammation and decline, or of suppuration and ulceration, each stage being hastened or retarded by external or constitutional causes, but never inverted. But if we apply to the one stage the means which are adapted only to the succeeding one, the result will be injurious; or if we lower the system so much that it becomes inadequate to carry on the regular succession of actions required for recovery, mischief must once more be produced.'

Dr Combe exemplifies this principle in small-pox and measles. In these cases 'the excitement often runs very high in the first or eruptive stage, and means are required to moderate it. But if we bleed too freely, it is well known that the eruption (which we shall suppose to have come out) will generally disappear, and increased danger to life ensue; because the order of nature being forcibly interrupted, some internal disease is brought on, or the system sinks exhausted. Whereas if, instead of bleeding excessively, we keep the patient very quiet, in a cool, well-aired room, and administer cooling drinks, mild laxatives or antimonials, and reserve bleeding for cases of necessity, the probability will be much in favour of recovery. To apply this to the pleurisy. Instead of being intent on cutting it short, the moment we ascertain its existence, we would have respect to its natural course and duration, and reserve our means to carry it safely through its regular stages. So far as my observation goes, cures would be more numerous and complete were this principle followed. If a severe bleeding disturbs fatally the progress of small-pox eruption, may it not also, when unseasonably used, injuriously influence the course of internal inflammation, and lead, for instance, to fatal oppression or effusion?'

Dr Combe counsels no inactive practice; for his views, to be fully carried out, would call for much greater vigilance and care than are usually bestowed. 'Disease,' says he, 'arises either from the habits of the individual, from accidental causes, or from peculiarities of constitution acted upon by these. Hence, on being called to a patient, the first step in the natural investigation is to examine the constitutional qualities, to make ourselves acquainted with the mode of life, feelings, &c. and to trace the manner in which the cause has acted or continues to act. All these influence very greatly both the nature of the disease, and its probable course. They also bear directly upon the kind of treatment, and its probable success. If, however, we are content to regard disease as an entity, arising by chance, and observing no laws, we shall have no inducement to trouble ourselves or the patient with any of these inquiries. Such is, in fact, the practical faith of the great majority of professional men. They discover the existence of an entity, which in medical works has a certain name, and, knowing that in the same books certain remedies are said to be good for that entity, they prescribe them accordingly, without giving themselves much concern about their mode of action or fitness for the individual constitution, age, or stage of the disease, and without inquiring whether there is anything in the mode of life tending to reproduce the malady or not. In many chronic ailments, removable causes are thus often left in full operation, while the effect is partially mitigated, but not cured, by the use of active medicines, and in a short time the whole evil returns in its full force. Whereas if, proceeding according to the order of nature, we can trace the disease to any error in the mode of life, to any external source of danger, or internal peculiarity of constitution, aggravated by either of these two conditions, we can convince the patient of the fact, and give him a rational and confiding interest in the changes which we may recommend, and thus not only promote his recovery, but render him proof against all the seductions of quackery. According to the prevailing kind of intercourse between patient and physician, namely, unhesitating dictation on the one hand, and ignorant obedience on the other, blind faith is the pivot on which their mutual connexion turns—a faith which is thus necessarily at the mercy of the chapter of accidents, and is often supplanted by reliance on the first bold and confident quack who comes in the way. People wonder that quackery abounds, and medical men ask for power from the legislature to put it down. They themselves, however, are in no small degree its abettors, and they have the remedy already to a great extent, although not wholly, in their own hands. If they who are educated, and should know better, accustom their patients to the principles of quackery, by themselves treating them empirically, can they wonder that patients who are not professionally educated, and are trained and treated on purely empirical principles, should be as ready to listen to the assurances of the quack as to those of the regular practitioner, whose manner of proceeding is often so nearly allied in kind, as to present no very obvious marks of distinction from that of the quack? In fact medicine, as often practised by men of undoubted respectability, is made so much of a mystery and is so nearly allied to, if not identified

with, quackery, that it would puzzle many a rational onlooker to tell which is the one and which the other. And this being the case, it requires no ghost from another world to explain why the profession has decidedly sunk in public estimation, and does not exercise that wholesome influence on public opinion which it ought to do.'

We would only add, that if a reform of medicine to the effect contemplated by Dr Combe is ever to be brought about, the public must take a share in it. They must cease to tempt their medical attendants into 'vigorous practice' by their irrational eagerness to see *something done*. They must be prepared to wait with patience to see nature, with the proper negative as well as positive assistance from man's hand and skill, regain her healthy action. And, as a first step to this improved treatment of their sick friends, they must altogether abandon that vulgar faith in doses and bleedings which has so long been—we speak in all soberness—a scourge to our race.

SHEMAHEIT, OR THE COCKNEY'S IRISH FEAST.

A TRUE STORY.

A WEALTHY Cockney, as is oft the case,
Possessed in Erin's land a handsome place;
A fine old castle, and some thousand acres,
With bog, wood, mountain, tenants, rocks, and breakers.
But hitherto he had been quite content
To see his property in shape of rent;
And never dreamt of such a hair-brained notion,
As that of venturing across the ocean:
Leaving the land where beef and pudding smile,
To dine on 'taters in the Emerald Isle;
Albeit the 'land of saints,' he heard it named,
For handsome women and strong whisky famed.
But our good Cockney was a married man,
And, drinking claret, cared not for a dram.

Now to my tale:—Unthought-of in those days
Were steamboats, coaches, tunnels, and railways;
A journey then was a vast undertaking,
A work of stern necessity's own making.
A voyage now to our Antipodes,
Would be performed with less fear, and more ease,
Than was the passage then across the Channel,
Loaded with lots of prog, and cased in flannel.
I said our hero married was, and wealthy;
But riches failed to make his children healthy;
For, one by one they budded and decayed,
As early spring buds 'neath a keen frost fade.
And two alone were left of seven or eight,
To keep his home from being desolate:
And they were delicate, this girl and boy,
And did of course their parents' thoughts employ.
And many a wakeful night and anxious day
They spent, in trying to devise a way
To keep those frugile, precious plants alive.
But ah! the more they're watched, the worse they thrive.
Oh wretched, pitiable state! full well
I know no sorrow that can this excel.
At length the doctors one and all declare
No hope remains but change of scene and air:
And when the parents their decision learn,
They settle on a visit to old Erin.

But passing over every preparation,
Their fears, their tears, at leaving their own nation,
Behold them settled in their Irish castle,
Attended on by many a ready vassal.
But ah! as yet no hopeful change appears
In the loved objects of their cares and fears;
And the desponding father, day by day,
Paced up and down his nicely-gravelled way,
Where the poor children slowly moved along,
Their easy carriage drawn by footmen strong;
As the ill-judging parents had the notion
Their limbs were quite too delicate for motion,
And that 'twas better thus to loll at ease,
Than skip and gambol 'mong the flowers and trees.

It chanced that often in his walks he came
Near to his gatehouse, where a comely dame
Toiled night and morn among a busy throng
Of noisy urchins, ruddy, fat, and strong;
And often he would stop, and turn his gaze
On the glad children at their merry plays;
Then, with a sigh, contrast them with his own,
And wonder how they had so healthy grown.
Soon he resolved to question the good dame,
And with this purpose to her dwelling came,
And after some slight prefatory chat,
'What food,' said he, 'makes your young squad so fat?
My cook is wearied making up new dishes—
Soups, sauces, curries, fricandaus, fruits, fishes;
No time or labour's spared, no cost or care,
To furnish for my children dainty fare.
But all our work and trouble's useless quite,
It does not bring them to an appetite;
And this one thing with wonder strikes me dumb—
The more they eat, the poorer they become.
For pity's sake, pray tell how you contrive
The dainty dish on which your young ones thrive?'
The woman, being with sense and wit endued,
Saw very plainly how the matter stood,
And that the children pined for proper food;
And feeling much for the afflicted man,
She in her mind resolved upon a plan
By which she hoped his children to restore
To better health than e'er they had before.
So she replied, 'Kind master, save on Sunday,
We dress no meat from Monday until Monday;
My children scamper to the bog or wood,
To bring home sticks or turf to boil our food;
Or, if too small for work, they play about,
Now here, now there, now in the house, now out:
Then hungrily they hot potatoes eat,
With sometimes milk, but oftener *shemaheil*.'
'But tell me how this dish is to be drest?'
The master cried. She answered, 'Sir, 'twere best
To send, when you return unto the hall,
Your cook to me, and I will tell him all:
But mind you, put that little coach away,
And let the children through the garden play:
'Twill give them a good appetite to eat
Our famous Irish dish of *shemaheil*,
Which, with potatoes, is our wholesome treat;
And bid them dress to-day no other meat.'

The cook was sent, the carriage put away,
The liberated children gladly stray
Through garden, shrubbery, and meadow fair,
Delighted at the wondrous things found there:
How sweet the pink, how beautiful the rose,
How bright the stream that through the meadow flows;
How gay the butterfly with painted wing,
How blithe the birds that in the branches sing,
How happy the young lambs that skip and play!
Oh! if they thus could spend each passing day,
How pleasant then were life—how worth possessing!
Then every hour would be indeed a blessing:
Not the dull, heartless, wearying case, that now
Clogged all the wheels of life, and clouded every brow.

At length the longed-for dinner-hour drew near,
When this most dainty dish was to appear;
This wonder-working food! health-giving meat!
This first of delicacies—*shemaheil!*
All was prepared; the table was laid out
With richest plate, as if for some grand route;
Silver, and china, and cut-glass were there,
All to do honour to this best of fare.
So the fond father ordered that his wealth
Might pay due homage to the food of health.
Scarce had the dinner-bell's enlivening call
Given its first summons to the eating hall,
When quick the folding-doors were thrown aside,
And, handing in his lady with great pride,
Dressed in the highest fashion of the day,
Forth came our hero in full court array,
Followed by both the children, wild with fun,
Talking of all that they had seen and done.
They take their seats—the worthy sire says grace,
'Big expectation' staring from his face;
Four liveried servants come—what have they got?
Four dishes of potatoes piping hot.
Again they come; on silver trays they bring
Four rich-chased silver covers—quite the thing.
The important hour's arrived, big with the fate
Of his loved children's health. Some moments wait,
Until he nerves his agitated spirit,
To face a dish of such surpassing merit.
Now raise the covers. What a vast surprise!
Lo! it is done—and *nothing* meets his eyes!
There lie the dishes, empty, cold, and bare,
As vacant as the astounded Cockney's stare.
Turning at last unto the footmen, he
Asked for the solving of the mystery;
Said, as it was a holiday, he would
Forgive the joke, but begged they'd bring the food.
What! not a tongue to answer; no foot stirred
To bring the expected dish. 'Speak out the word;
Tell me at once, has the cook spoilt the meat?
And is there *nothing* left of *shemaheil*?'
The angry master cried. Then all declare
They did his bidding—*shemaheit* was there!
The cook was called; he said, 'Twas master's wish
To have potatoes, and no other dish!'
'But *shemaheil*?' the indignant master cries;
'But *shemaheil!*' the stormy cook replies.

'And where, then, is it? Here is *nothing!* Look!'
'Can *anything* from *nothing** come?' says cook.
'Tis hard to say how long this war had lasted,
Had not the children, who all day had fasted,
Charged the potatoes with such appetite,
It changed their father's anger to delight;
So, ordering up a jug of milk, they all
Made a right hearty dinner in the hall.
The children too, being strengthened by their meal,
And not oppressed, as they were wont to feel,
Soon as the frugal feast was cleared away,
Began to chat about their pleasant day;
And the fond parents' hearts beat high with joy,
While gazing on their happy girl and boy;
Already fancying that they clearly trace
Health's brightening sunshine gleaming in each face;
And gratefully they bless the friendly cheat,
That gave them for their dinner *shemaheit!*

My tale is o'er. Suffice it now to say,
That each returning year, on this same day,
The happy father, mother, daughter, son—
Ay, and their children's children, many a one—
All their domestics, and, you may be sure,
The gatehouse woman who had wrought the cure,
Assembled round the table, richly spread
With silver covers, font, and sides, and head,
To do due honour to their frugal fête
Of hot potatoes, milk, and *shemaheit!*

M. A. G.

* *Shemaheit* is the Irish word for *nothing*.

A FEW WORDS ABOUT SAVINGS' BANKS.

A FRIEND of the rural labouring population publishes, in the 'Agricultural Gazette,' the following address, with a request that those who have it in their power may contribute to its more extensive circulation. We readily respond to this request by transferring it to our columns, and by recommending its advice to the industrious classes generally—whether manufacturing or agricultural:—

'So you are a poor man, willing to lay by a shilling a week, but want to know first a little about a savings' bank?—well, then, it shall be told you. A savings' bank is an institution for receiving small savings, established by wealthy people, who would like to see you better off in your circumstances, and more respectable in your condition. They neither receive profit nor advantage from it—on the contrary, they devote much of their time and attention to its management: they would rather you should save your money by depositing it in a savings' bank, than by spending it in a wasteful way at the alehouse or at home. They would wish you to save what part of your hard earnings you can spare, against a time when it will stand a friend to you—when you may want it more than you do now—when every shilling may be worth to you as much as two shillings are at the present moment. This they would have you do for your benefit, and then by and by you will be able to help yourself in a time of scarce employment—in a time of sickness—in a time of old age—when it will comfort and relieve you, instead of having starvation at home, poverty at your sick-bed, and your old days ended in a workhouse. A savings' bank is a place of profit, as well as a place of deposit. This is a great advantage to you; because, if there were no such institution as a savings' bank, you could receive no such profit for your money, whereas a savings' bank gives you interest for small sums, which you could receive nowhere else. A savings' bank is a place of security—better, in fact, than any other security you could get elsewhere. Remember this, that as soon as you place money in a savings' bank, you become, by the possession of your deposit-book, the creditor of the nation—that is, the government who represent the nation are your debtors. In short, your money is just as safe there as if you placed it in the Bank of England; because your money eventually forms a part and parcel of the money in the Bank of England, and you have as much right to recall it as any nobleman who may have fifty thousand pounds there, with this difference only, that you apply for it through the agency of the gentlemen at the savings' bank, who are your trustees in the matter. Lastly, at a savings' bank you receive back your money when you wish it, without being asked what you want it for. If at any time you should desire ten shillings or a pound, you have merely to take your deposit-book and apply for it, and it is paid you immediately. Remember, too, that in a savings' bank you are subject to no income-tax, nor any other tax. You are not obliged to take all your money when you want only a part: you may take out what you please. If you do not receive your money at the end of every half-year, you have added to your account interest in proportion to the amount you have in the bank. If it please God that you may not want to receive any part of it, and still keep on adding to it, you will in a few years have in the bank something to comfort you in sickness—provide for you in old age—or befriend you in a time of need. If nothing of this sort should happen, you will have the comfort of leaving to your family a few pounds at a time when it will be most needed. Think on these things—consider well for whose benefit savings' banks were established—if for yours, fail not then to embrace the advantages held out, and begin immediately by depositing your first shilling.'

'A PATCH ON BOTH KNEES, AND GLOVES ON.'

[From the Boston Courier.]

WHEN I was a boy, it was my fortune to breathe, for a long time, what some writers call the 'bracing air of poverty.' My mother—light lie the turf upon the form which once enclosed her strong and gentle spirit—was what is commonly called an ambitious woman; for that quality which overturns thrones and supplants dynasties, finds a legitimate sphere in the humblest abode that the shadow of poverty ever darkened. The struggle between the wish to keep up appearances, and the pinching gripe of indigence, produced endless shifts and contrivances, at which, were they told, some would smile, and some, to whom they would recall their own experiences, would sigh. But let me not disturb that veil of oblivion which shrouds from profane eyes the hallowed mysteries of poverty.

On one occasion it was necessary to send me upon an errand to a neighbour in better circumstances than ourselves, and before whom it was necessary that I should be presented in the best possible aspect. Great pains were accordingly taken to give a smart appearance to my patched and dilapidated wardrobe, and to conceal the rents and chasms which the envious tooth of time had made in them; and, by way of throwing over my equipment a certain savour and sprinkling of gentility, my red and toil-hardened hands were enclosed in the unfamiliar casing of a pair of gloves, which had belonged to my mother in days when her years were fewer, and her heart lighter.

I sallied forth on my errand, and on my way encountered a much older and bigger boy, who evidently belonged to a family which had all our own dragging poverty, and none of our uprising wealth of spirit. His rags fairly fluttered in the breeze; his hat was constructed on the most approved principle of ventilation; and his shoes, from their venerable antiquity, might have been deemed a pair of fossil shoes—the very ones on which Shem shuffled into the ark. He was an impudent varlet, with a daring swagger in his gait, and 'I'm-as-good-as-you' leer in his eye—the very whelp to throw a stone at a well-dressed horseman, because he was well-dressed; to tear a boy's ruffles, because he was clean. As soon as he saw me, his eye detected the practical inconsistencies which characterised my costume; and taking me by the shoulders, turning me round with no gentle hand, and surveying me from head to foot, exclaimed, with a scornful laugh of derision, 'A patch on both knees, and gloves on!'

I still recall the sting of wounded feeling which shot through me at these words. To parody a celebrated line of the immortal Tuscan—

'That day I wore my gloves no more.'

But the lesson thus rudely enforced, sunk deep into my mind; and in after-life I have had frequent occasion to make a practical application of the words of my ragged friend, when I have observed the practical inconsistencies which so often mark the conduct of mankind.

When, for instance, I see parents carefully providing for the ornamental education of their children, furnishing them with teachers in music, dancing, and drawing, but giving no thought to that moral and religious training from which the true dignity and permanent happiness of life alone can come, never teaching them habits of self-sacrifice, and self-discipline, and control, but rather by example instructing them in evil-speaking, in uncharitableness, in envy, and in falsehood, I think, with a sigh, of the patch on both knees, and gloves on.

When I see a family in a cold, selfish solitude, not habitually warming their houses with the glow of happy faces, but lavishing that which should furnish the hospitality of a whole year upon the profusion of a single night, I think of the patch on both knees, and gloves on.

When I see a house profusely furnished with sumptuous furniture, rich curtains, and luxurious carpets, but with no books, or none but a few tawdry annuals, I am reminded of the patch on both knees, and gloves on.

When I see public men cultivating exclusively those qualities which win a way to office, and neglecting those which will qualify them to fill honourably the post to which they aspire, I recall the patch on both knees, and gloves on.

When I see men sacrificing peace of mind and health of body to the insane pursuit of wealth, living in ignorance of the character of the children who are growing up around them, cutting themselves off from the highest and purest pleasures of their natures, and so perverting their humanity that that which was sought as a means insensibly comes to be followed as an end, I say to myself, 'A patch on both knees, and gloves on.'

When I see thousands squandered for selfishness and ostentation, and nothing bestowed for charity; when I see fine ladies, be-stained and be-jewelled, cheapening the toils of dressmakers, and with harsh words embittering the bitter bread of dependence; when I see the poor turned away from proud houses, where the crumbs of tables would be to them a feast, I think of the patch on both knees, and gloves on.

FACETIÆ, &c.

Convivial Blunders.—It is, or might have been, recorded in the opera of Josephus Molaris, that a person at a public dinner, who had drank to the health of the Adelphi, which had been proposed in honour of the two brothers, the Duke of Wellington and the Marquis of Wellesley, but who probably imagined that the toast had some relation to the 'Health of Towns Commission,' rose and proposed the health of his own quarter of the town—Charing Cross. Of the same nature was the mistake of the Mr Toole of a former day, when the lord mayor, at a dinner given to the French ambassador, proposed the health of the three consuls. This toast was repeated by Mr Toole's predecessor, as the 'Health of the three per cent. consols. Hip, hip, hip, hurrah!'—*Amos's Advantages of a Classical Education.*

Exclusivism of Italian States.—The Paris papers lately mentioned that two works on galvanism had been seized by the pontifical government at Rome, under the impression that they related to—Calvinism. To this we can add a similar fact, not before published, namely, that on a gentleman landing a few years ago at Naples, with a copy of Mr Combe's Essay on the Constitution of Man in his trunk, he experienced considerable difficulty in passing the custom-house, the government officers regarding the volume as a political work in favour of the constitutional cause.

Consequences of War.—The *New York Express* gives a view of this subject with regard to the present crisis, so pithy, and so generally instructive, that we think it worthy of a place in this more permanent record. 'The banishment of our merchant ships and coasters from the ocean and lakes; suspension of specie payments; universal rag-money; direct taxes; no revenues from the customs; no commerce; taxes on farms; taxes on cattle; taxes on crops; stamp taxes; taxes on everything; a national debt of two hundred millions for a war of four years; the bombardment of New York, Oswego, Buffalo, Detroit, Chicago, and Charleston; the blockade of all our ports, rivers, and sounds; constant plunderings upon the sea-coast; repeated summonses to arms; conscription among the militia; widows, orphans, hosts of men with one leg, one arm, one eye, maimed, mutilated, &c. These are but partial pictures. All will end in the resumption of negotiations; and if the negotiators cannot agree, in arbitration—the point we start from!'

A Learned Mayor.—Lord Mansfield, when on the circuit at Shrewsbury, having been asked to dinner by the mayor of the town, his lordship observing an antique clock in the room, remarked to the mayor, 'That he supposed Sir John Falstaff fought by that clock;' to which the mayor replied, 'He could not tell, *for he had not the pleasure of knowing Sir John.*' Lord Mansfield then tried his host on another subject, and remarked, 'That the town appeared very old;' to which the mayor replied, '*It was always so, please your lordship!*'

CERTAIN ATTENTIONS IN LETTER-WRITING.

The neglect of the following points in our letters often produces inconvenience and trouble, and not seldom more serious evil. They ought to be impressed upon, and practised by, learners.

1. Attain and preserve a *legible signature.* Many letters miscarry or remain unanswered from the impossibility of making out *who* wrote them. Your *address* should also be written as carefully and legibly as your signature.

2. Sign your Christian or first name *full*, that your *sex* may be known to a stranger, to whom you write. Signing by the initial letter only is a slovenly practice, and often produces ludicrous mistakes in the answer received. Ladies are addressed 'Esquire,' and gentlemen 'Mrs' or 'Miss.'

3. In *every* letter, or even card, get the habit of giving your address full, as for the post-office. Some people think that if they do so once it is enough, and the *second* letter comes dated, it may be, '*London.*' If the first has been mislaid or destroyed, and their number is forgotten, to say nothing of their street, they cannot be surprised if they get no answer. They write another letter, wondering that you have not written; *that* letter too dated '*London.*'

4. When you write a *proper* name of person, place, or thing, recollect that, if it be carelessly and illegibly written, the context gives the reader no help. Therefore get the habit of writing such words plainly, almost in *print hand*, if you would not cause your correspondent the trouble and loss of time of writing to you again, to request you to do the very thing which you ought to have done at first.

5. Call to mind to *whom* you are writing, when you come to *announce yourself* at the end of your letter. Very many people are too familiar. This is always offensive: the respectful, even beyond the necessary, never is so. 'Yours truly' suits well equals in age and station. 'Yours faithfully' is a little more respectful. 'Yours respectfully' is proper to seniors and persons above you in station, when you know them well. 'Your obedient servant' is proper to *all* strangers, and persons of condition. But good sense and right feeling will, in the circumstances, always suggest the right expressions. Above all, avoid the over-familiar.

6. Always use an envelope, and seal with *wax*, when in the least on ceremony.

7. *Always*, when you request an answer in a matter of your own, enclose a postage stamp, or more if necessary. A ready-stamped and addressed envelope is still better. This attention neglected, tells seriously on persons who have information to furnish which others are interested to obtain. A friend of ours, who has acquired some notoriety through the newspapers in consequence of a peculiar contrivance in the domestic arts, tells us that he receives a great number of letters wishing to know all about it, and not in one of them a postage stamp for his answer—itself a pretty heavy tax upon him.

SCIENTIFIC PROPHECY.

Newton expresses his deliberate opinion that cohesion, light, heat, electricity, and the communication of the brain with the muscles, are all to be referred to one and the same cause—an ether or spiritus, which pervades all bodies. We might smile at such an opinion from many quarters; and had Newton been only the author of the 'Principia,' we might perhaps think his head a little exalted by the excitement attending the close of an arduous labour (though, in truth, the scholium, from which the above is extracted, does not appear in the first edition); but when we consider his prediction, that the diamond would be found to be combustible, that the earth was between five and six times its weight of water, and others which have turned out correct, we feel something like a presentiment that the opinions just cited may in some degree share the same destiny.—*Dublin Review.*

VALUE OF COMMUNICATION.

Both our mental and moral acquisitions increase by their communication to others: which gives an illustration of two truths—first, that we are framed to carry out the law of love; and second, that the possessions which multiply in the imparting are naturally the most valuable.—*Literary Florets*, 1846.

THE AUTHOR IN HIS STUDY.

'THOUGHTS ON COURTSHIP.

'There is a brief period of romance in the life of every man and woman; it is the time when those attachments are formed which usually lead to the permanent union of kindred hearts. Sweet flower-time of our life's year! Dull, indeed, and sordid would existence be, if this season were left out—a year without a May! Yes, summer may bring its hay, and autumn its sheaves, and our well-spent prime and middle-age may leave not only ample stores for a dignified elderhood, but, what is of far more value, the self-satisfied reflections which await those who can look back on an active and useful life; but yet, if this brief time of blossom were to be omitted, an important element would be wanting in our recollections; life would appear as if spent in vain; and it is questionable if our latter days would, in that event, be so happy.'

Pretty well so far. A romance, forsooth! Such a May in our life's year as Mays usually are with us, compared with the Mays of the poets. A good deal of the east wind to temper it. One thing I know, that when I made up acquaintance with Georgina, it was one scene of torment from beginning to end. In the first place, nearly all her friends disliked me. My mother was jealous of a daughter-in-law—what mother ever was not?—Georgina herself had an old unsettled balance of attachment to her father's chief clerk, who had been sent out of the way; so even her inclinations to the match were a matter of some doubt. What worryings there were from all these things together! The only smooth point was her father's favour for me, which my mother always said was from a regard to my family and fortune. Such was *my* time of blossom!

'It is not that the season of courtship is merely a pleasant time, which furnishes agreeable food for the memory afterwards, although this we conceive to be one of its most important characters; it appears in a higher light, when we consider the effect which it usually produces on the human character. For that time, at least, common worldly views are lost sight of, and a generous devotion to the interests of another is substituted for our usual selfishness. It is in the moral effects of the tender passion that we may most fully appreciate the interesting place which it takes in the great scheme of things.'

I must keep all about settlements in the background of course. Neither is a word to be said of inquiries into how much the lady has, or of her claims in the matter of pin-money.

'In that period of youthful passion, how delightful those moments when the parties are privileged to be alone—forgetting all the world, or rather all the world to each other! Then it is that the banks of the limpid rivulet have their attractions, particularly when the golden sun has just given place to that tenderer luminary which, time out of mind, has been associated with the thoughts of lovers. The dew is on the grass; the nightingale makes vocal the neighbouring grove. A silver radiance is spread over the face of nature, and all ordinary sounds are hushed. What heartfelt rapture is it, then, for the youthful pair to wander along, unseen of all but each other—no word spoken; such communion of soul requiring no words; only looks, and gentle sighs, and throbbing hearts, making up the conversation. Oh, bliss beyond compare—too exquisite to last! And well it is so; for were it otherwise, man would make of earth his all-sufficient heaven!'

This will do, I think, for the young ladies. I may only remark, that a parlour and a couple of candles more frequently form the scenery of such little dramas—even lovers being wise enough to know that a damp evening, by a water side, is apt to lead to that morbid affection which usually demonstrates itself by a running of the nose. Troublesome work it often is, especially where the house is not remarkable for spare apartments. Always there is some inconsiderate school-girl sister, who *will* insist upon coming in to do her practisings on the piano; or else a little wag of a brother, who can't be frightened from playing off tricks upon you—such as tapping at the door, and running off with a great laugh, or sending in the servant with scuttle and broom to mend the fire, when it is quite unnecessary. Only once, taking an afternoon walk with Georgina, we sauntered into a path by a river side; but we were soon brought to a stand by a farmer, who told us, in no very gentle terms, that we were trespassing, and ordered us back. Poets who would wander by

> Shallow rivers, to whose falls
> Melodious birds sing madrigals,

do not usually reflect that river sides are property, and that intruders are liable to be 'prosecuted with the utmost rigour of law.' Once more, however, to the breach.

'The happiest courtship, like the most beautiful day, must come to a close. But there is a time which is neither courtship nor matrimony, but something intervening, and which may be said to partake of the different kinds of happiness appropriate to both. Then, reposing upon the sweet consent which he has gained, the lover feels that any anxieties which he lately underwent are more than repaid. Fear he has dismissed; he smiles at the thought of a rival; he now knows that this sweet angel, who walks so lovingly in his arm, is she with whom he is to spend the rest of his days. The interest formerly felt in her is now, therefore, infinitely deeper and more tender. Mysterious affinity of souls—wonderful are the gushes of happiness which flow from it! It is a pleasant duty of that

time to make the acquaintance of each other's relations and dearest friends. All are so happy to see their new associate. It seems like doubling all the enjoyments derivable from social life at once. Most agreeable, too, is it to select and establish that home where the pair is to commence their wedded existence. Two minds are concerned in the case, with all their various tastes and likings; but the discussion of particulars is only a source of pleasure for the occasion it gives to consenting. The lover rejoices in the traits of sense, forethought, and economy which he sees in his adorable; she equally glows at the marks of a conceding and obliging disposition which she finds in him. The first glimpses they thus get of each other in a domestic capacity are truly delightful, perhaps more so than any other circumstance in the whole chronicle of their loves. Such recollections dwell on the memory through all subsequent events. At length the long-looked-for day arrives; and amidst the flutter, the brilliancy, the mingled tears and smiles of a bridal party, closes this one brief unrepeatable chapter of human existence—COURTSHIP.'

There, now—that will do. The reality of the case most people will be able to supply for themselves. Assurance against rivals!—more likely the poor youth has some faint notion that the young lady's mamma has 'managed' him into it! Friends, too. Gracious powers, save me from the friends!—all criticising you in every point; many disapproving. Your adorable's grandmother quite disappointed in her choice: she again finding her designed mother-in-law either candidly cold or forcedly agreeable. When were friends ever a source of happiness at a marriage? Then those odious visits to Mr Trotter's, to choose beds and basin-stands. Oh, upholstery! why hast thou so much to do with young love? The Paphian bower was surely not formed of mahogany-trees. Such a debating about drawing-room curtains and tables. Such a worrying as to that expensive pier-glass. The lady's mother and sisters all against you too. The first glimpse of her in a domestic character indeed! Well is it for you, my friend, if, with one thing and another, you are not worried out of your senses long before your wedding-day.

THE ACCOMMODATION BILL.

BY ELIHU RICH.

IT was somewhat before his usual hour of business that Charles Percival, the proprietor of a respectable trading establishment in the environs of London, might have been seen to enter his counting-house, and throw himself into a chair with an air of extreme dissatisfaction. Seeing that it still wanted a few minutes to the time for which he had received an appointment, he took a memorandum-book from his pocket, and slowly conning its pages, gave vent to his disturbed feelings in certain monosyllabic ejaculations.

At length a gentle tap was heard at the door, and a man of apparent respectability entered the office. The compliments of the morning were briefly exchanged; and the new-comer seated himself with the familiarity of an old acquaintance.

'So, Percival,' he began, at the same time taking a pinch of snuff from a silver box, which he passed across the table to his friend, 'you really cannot assist me in this unpleasant business?'

'I really do not see how I can, Mr Johnson. My own engagements are extremely heavy, and everything of late has been excessively dull. In fact, if you cannot pay the bill when it is presented, I have but one alternative.'

'But surely,' replied Johnson, with a searching glance of mingled apprehension and defiance, 'you would not law an old friend?'

'I would do nothing, my dear sir, to inconvenience any man alive, unless circumstances compelled me. But how am I to act? So far from being prepared to meet an emergency like this, I have all along calculated upon receiving the balance of your account.'

'Oh, as for that,' was the cool retort of Johnson, pausing for an instant, with a fresh supply of the 'real Irish' between his finger and thumb, 'it's quite out of the question; so you must make up your mind to wait. I have spent all my capital on the buildings, and, I may as well tell you candidly, shall not possess a shilling until I sell or effect a mortgage;' and, seeing the discomfiture of his friend at this announcement, he assumed an air of complacent indifference, and formally concluded the olfactory manipulation in which he had suffered a moment's interruption.

The temper of Percival was by no means a choleric one, but many circumstances had of late conspired to make him somewhat excitable. Johnson owed him a large sum of money, for the want of which he was obliged to suffer many advantages to pass by unimproved. At length he had succeeded in procuring the defaulter's acceptance to a bill of exchange, which would fall due on the morrow, and, as it now appeared, must either be taken up by Percival himself, or be openly dishonoured.

'Really, this is too bad,' he exclaimed, rising from his chair with vexation; 'you keep me in the dark until the last moment, and then plainly tell me I must pay your debts or lose my own character. Is it possible, Mr Johnson, I can be deceived in you?' he added, suddenly confronting him.

'In other words, you mean to ask whether I intend to be honest? I am not, however, disposed to quarrel with you. It is true I have no ready money at present, but the property will very soon realise something handsome; and all I ask is, that you will help me over a month or two.'

'I would most gladly, but I rather need assistance myself,' was the unwary rejoinder; and a sudden sense of the absolute truth which it conveyed to his companion subdued the ebullition in which Percival had indulged, and brought him to his seat with an irresolute and melancholy air. Johnson eagerly embraced the opportunity offered by this exhibition of weakness.

'Then I'll tell you what we must do to get over our difficulties. In the first place, I will give you another acceptance for all I owe you, *in exchange for one of yours*, and then mortgage or sell at once to meet the bills as they fall due.'

'But, you know, I always object to this mode of dealing.'

'Oh, it's all in the way of trade; only you're so very particular; and, besides, what else can be done under the circumstances?'

The conversation, which we need not follow in detail, now assumed a more friendly tone on both sides; in fine, the bills were severally drawn, much to the satisfaction of Mr Johnson, who, armed with the good name and credit of his friend, had no longer any doubt of withdrawing his acceptance on the morrow. Percival also, by this arrangement, expected to receive a supply of ready cash; but the risk he ran far outweighed even in his own estimation, when he calmly reflected upon the transaction, any immediate benefit he could receive. His supposed friend might prove treacherous, or, if not, his affairs might become involved—perhaps illness or death might overtake him. Yet this, unfortunately, is the prevailing method of conducting business. No sooner does a little difficulty occur, which in many cases prudence might prevent, or industry and self-denial overcome, than the fatal facilities afforded by the bill system are put in requisition, and the most intricate paths of mercantile policy entered upon—rashly, blindly, dishonestly. It frequently happens that one of the parties to these transactions is a designing scoundrel, who finds a short-lived advantage in the other's folly, and leads him to irretrievable ruin.

In order to ascertain how far these remarks are applicable to Percival and Johnson, we will introduce our readers to a more intimate acquaintance with each of them, and endeavour to portray the little incidents of the evening which closed the day of the above transaction.

Charles Percival returned home as usual in the early

part of the evening, and immediately his little Alicia, upon whose brow the rosy light of five summers reposed in the freshness of its beauty, bounded with a gleesome step to her father's side, and greeted him with a child's welcome of love; but an unwonted shadow seemed to cloud his countenance, and, after the first few moments of gratulation, the playful sallies of the child were all unregarded; so she crept to her mother's side, seeming to feel that her spirit was rebuked.

The evening meal, as might be expected after such a prelude, passed over in silence; for Mrs Percival had sufficient of true womanly intelligence to feel that a husband's confidence is not to be won by abrupt and pointed questioning. It was her aim, on occasions like the present, rather to awaken his kindlier feelings by a tacit acquiescence in the humour of the moment, than by the exhibition of that careless good-fellowship which is sometimes regarded as the most unexceptionable means of reclaiming an absent heart. The heart of Charles Percival, however, was not wont to be estranged; and even now, while he brooded over the conceptions of future difficulty and danger, which had rapidly succeeded each other in his mind, it was the thought of his beloved home, and the hardships that might be entailed upon his family in the event of his friend's failure, which embittered his reflections. In this mood, the smiles of his little one could but awaken a more heart-searching melancholy. Her silence, therefore, and her mother's sensitive kindness, formed for him, even at his own hearth, a solitude in which the stronger feelings of his nature might gradually subside, and allow the gentle stream of home-affection to roll on in its accustomed channel. He might, indeed, for a time appear wholly absorbed in his own reflections, and apparently unmindful of his wife's solicitude; but as the light of home kindled in his heart, and the gloom cleared from his brow, a rich reward was hers in the fulness of his confidence, and the trusting faith with which he reposed on her truthful and hopeful counsels.

Her clear perception of right and wrong was expressed on the present occasion with more than her usual decision, but with a proportionate increase of affectionate zeal for his honour and welfare. Earnestly endeavouring to point out the fallacies by which men of business too frequently suffer themselves to be misled, she appealed to his own conscience whether the transaction of the morning was not a deception in the worst sense of the word. 'Mr Johnson,' she remarked, 'is considerably in your debt; and not only so, but he confesses the necessity he is under, in consequence of trading beyond his means, of dishonouring a bill rightfully drawn and accepted in the regular way of business. This single fact proves him to be a man unworthy of your confidence; for it clearly shows that he cannot restrain his speculative disposition within the bounds of prudence. Your true interest, therefore, if you will pardon my rebellious tongue, dear husband, would consist in closing your account with him; and whatever inconvenience the loss might occasion to myself, trust me, Charles, I would willingly endure it. Unfortunately, you have suffered his words to beguile you, and, while kindly thinking of your own family, have furnished him with a recommendation to every tradesman in the town, upon which he may increase his credit to an indefinite extent, and do tenfold mischief to the families of others.'

'In this at least, Anne, you are mistaken. He has no recommendation from me, I assure you, and never will have, until I am better satisfied of his integrity.'

'Your very name, my dear Charles, on the accommodation bill is a recommendation; and is it not a gross deception upon society, that, at the very moment when he owes you a large sum of money, you give the world a written certificate that you are in his debt? But the result of this affair,' she added playfully, little thinking with what prophetic truth she spoke, 'will furnish a new text for my argument, and then we shall see.'

The conversation having arrived at this point, was adroitly turned by Mrs Percival to other subjects. A masked ball was appointed to take place that evening at the assembly rooms, not far from their residence. The merits and demerits of this exhibition were the subject of debate, when a carriage was heard approaching, and in a few moments a visitor was ushered into their presence in the person of Tom Mason, the accepted admirer of Mrs Percival's sister. He was not the less welcome, after a conversation so grave as that we have recorded, for the laughter excited by his grotesque appearance—being habited for the masquerade in the melancholy garb of a Hariolus of the olden times, and wearing a long gray beard. His ready wit and good-humour were soon evinced in the bantering which passed from side to side. But the fair Matilda, who had agreed to play Miranda to this veritable Prospero, was awaiting his arrival at the enchanted hall, and thither we will take the liberty of following him.

Our purpose in mingling with the gay throng is neither pleasure nor pastime; we therefore single out the objects of our pursuit, and at once resume the thread of our narrative.

One of the dances had but just ended, when our potent magician was beckoned aside by a superbly-dressed masquerader—a king or an emperor at the least—who, as they moved towards a retired part of the room, was heard to mutter something about the difficulties of business: but thus it ever is with your great men.

'Oh, a plague on your business to-night,' was Tom's hasty reply; 'you're always in some difficulty. But what is it you want, for I see my Maud has already discovered that I am playing the truant?'

'Why, the fact is,' replied his interlocutor in a coaxing tone, 'I want a bill discounted the first thing in the morning, and unless you can oblige me, I hardly know how to accomplish it.'

'Well, I'm sorry for you, but paper money is rather out of my way just now. *Scrip*, you know,' added the waggish magician with a significant wink.

'No; honour bright, I assure you. In fact, the bill is accepted by your own particular friend, Percival. No suspicion of kite-flying in that quarter, I hope!'

'Well, I believe not; and if the amount is not too large, I'll try what I can do for you. But hark'ee, Johnson; eleven o'clock at soonest, after such a night as I mean to make of it.'

And so saying, Tom rejoined his fair companion, whom he led through the mazy dance with a joyous spirit; for he was really proud of her beauty and accomplishments, and a few months would make her his own. Though associated for a brief space with the heartless and the frivolous—of which quality a large proportion of such midnight revellers too often consists—it was nevertheless impossible that the lovers could become insensible to their own earnest purposes. The realities of life had so moulded the disposition of each, that they deemed their approaching union the seal of a solemn contract not only with each other, but with society at large. It is true, and by no means ought such a truth reflect anything save the goodness of their hearts, their ideal of happiness was somewhat coloured by romance, and grounded on extravagant plans of benevolence; but, on the whole, their expectations were rational and well-founded. Mr Mason had hitherto prospered in business, and the little surplus which he had realised over his floating capital was amply sufficient for the wants of a first establishment. Under these circumstances, their minds were by no means absorbed by thoughts of selfish pleasure; and, being ever careful to preserve the conscience void of all offence, no heart-burnings or vain regrets could follow the innocent hilarity with which they enjoyed an occasional irruption into the domain of mirth and humour.

Johnson, on the contrary, was unaccompanied by any real friend on this occasion—a circumstance affording in itself presumptive evidence against a man of pleasure, since it shows a lamentable want of the finer sensibilities in social intercourse. How he passed the hours intervening between the close of the ball and high noon on the morrow, we care not to inquire; suffice it that, about the time mentioned, he called on Tom for the redemption of his promise, and went to sleep in his chair before the

check could be drawn. When aroused from this utter oblivion by the voice of his good-natured friend, a resort to his unfailing expedient, the snuff-box, served well enough to close the business with an air of self-possession, and help him across the threshold without stumbling. It now only remained to pay the amount of Percival's draft, which he mechanically accomplished, and then farewell to any anxiety on his part for three months longer.

* * *

It is one of the worst features of the traffic in these paper securities, that its legitimate functions are too often overruled by expediency; and one expedient begets another, until they become so involved, as to assume the fatal aspect of necessities. Percival, in assenting to the accommodation proposed by Johnson, saw clearly enough that he was risking double the amount of the original debt: but he had no suspicion that his own hands had forged the chain by which his future operations would be impeded, and which—unless, like an Alexander of his class, he had genius enough to cut the knot by a straightforward resort to principles in place of policy—might ultimately starve him into acquiescence with the meanest proposals. It was not long, however, before he began to perceive that he was in the toils.

For certain reasons, known to no one so well as themselves, the lovers had fixed an early day for the wedding—a period within two months after their appearance at the *bal masque*. The preparation for this important event occasioned what Mason termed 'a hard pull' upon his banker's account; and the rate of discount being somewhat higher than usual, he was unwilling to appear solicitous for any immediate favours. But as he held Percival's acceptance, and had no reason to suppose that his friend was in difficulties, he determined upon asking him to honour it about three weeks before it became due. On intimating to Percival that such a course would do him considerable service, no objection was made. Too prudent to explain his circumstances, and too proud to confess to the real nature of the transaction, Percival promised the money in a day or two, and naturally fell back upon Johnson for the supply.

That gentleman now saw the predicament in which his dupe was placed, and pleaded his utter inability to meet such an unexpected demand. He had made arrangements for mortgaging the property, but it would be some days before he could draw any portion of the money. Here, then, it seemed expedient to exchange bills once more—a transaction by which Percival's risk of loss was tripled; for Johnson's first acceptance was taken up with money raised on Percival's security, and that security was now redeemed before its time by Percival himself, and another issued in its room. This complication of troubles, however, was but a beginning of difficulties. The completion of the promised mortgage was now deferred, under the pretence that the houses were not yet habitable, and the mortgagee would not be troubled with them in their unfinished condition. At length Percival was induced to provide materials and workmen, hereby exhausting all his resources and his credit in the desperate hope of retrieving his first false step. That ultimate success would crown his efforts, he never doubted; for, by the advice of his wife, he had obtained what he considered a fair guarantee for the risk—a *lien* upon the property—which he was now straining every nerve to bring into the market. Meantime bills were freely exchanged, and frequent renewals on every hand became a thing of course.

Long before the property was ready to be disposed of, Percival had become deeply involved; but the guarantee, which he thought he had been fortunate in securing, was the sheet-anchor to which he clung. Under the most unfavourable circumstances, even supposing a forced sale to be unavoidable, a much larger sum would be realised than would suffice to discharge every obligation, and the profit upon the extra labour would well enough repay the anxiety he had suffered: as to the morality of the means by which he had first supported the credit of Johnson, and finally his own, that he reasoned away by an appeal to the necessity under which he had acted. Alas! the conviction of its utter fallacy was to be forced upon him by a fearful awakening reverse.

As the works approached completion, he observed, with some degree of uneasiness, that Johnson frequently absented himself for days together, and even began to neglect the precautions they had adopted for warding off suspicion as to the nature of their bill transactions. After a day of considerable anxiety on this account, he returned home to seek, in the bosom of his family, that oblivion of the care-producing world which could alone restore his wonted serenity. For some time past his wife had carefully avoided the mention of a subject upon which she was aware he felt so anxiously, as that of Johnson's conduct: but his increasing despondency weighed heavily on her mind; and seeing now that he tried in vain to assume a cheerfulness which was evidently far from his heart, she took an opportunity, in the course of the evening, to make inquiry, and learnt with surprise the ground which existed for renewed suspicions of treachery on the part of Johnson, as well as the total ruin which its success would entail upon themselves. A retrospect of all the circumstances suggested so many causes of alarm as to the validity of the guarantee held by Percival, that it was resolved to seek satisfaction on the morrow, though it might confirm their worst fears, and hasten the catastrophe.

On this errand Percival departed early in the morning, and in two short hours returned with an age of care marked upon his brow, and a torrent of indignation boiling in his veins. The agitation of his manner was too extreme to escape the notice of his wife as he suddenly entered the sitting-room. The issue of his inquiries was too evidently the utter prostration of their hopes, to need either question or answer. He took a few turns across the apartment without uttering a syllable, and then suddenly paused on observing, for the first time, the little Alicia cowering before his angry glance, and really fearing to smile or speak. This was too much for the father's heart, and he moved hastily towards the door; but his wife threw herself upon his bosom, and with streaming eyes intreated him to be calm. 'Their own unalterable love for each other would lend to every hardship they overcame the charms of a triumph; and as for the unprincipled hypocrite by whom they had been deluded,' she added, 'leave him to enjoy his dearly-purchased success—at best, a short career of sordid iniquity, and a feverish joy in life.'

But Percival had not yet summoned philosophy or calm religion to his aid, and this allusion to his enemy seemed to smite him with a fresh plague of wrathful indignation.

'My curse upon him,' he muttered between his teeth—'the curse of a ruined family; and may it rankle in his treacherous heart until he feel as wretched as I do!'

'For shame, Charles; for shame,' exclaimed Mrs Percival in a low tone, placing her finger on his lips. 'The curse of evil needs no invocation; for, alas! it grows with the growth of wickedness in the will itself. But look you, my love,' she suddenly added, gazing into his eyes with intense affection, 'if we are to be tried in the fires of temptation, be assured we shall lose nothing but dross and corruption; and, please God, we will resume our pilgrimage, poorer, maybe, in the sight of the world, but richer in heart than heretofore.'

'I can hardly hope it, Anne. When I think of the change wrought by that consummate villain, and the power of evil everywhere, I feel nothing but indignation and unmeasured abhorrence——'

'There—stop, my dear Charles; suffer that indignation to expend its force, but control its direction with your own earnest will. Its rightful mission is to overturn every disorderly passion in our own breasts; and would God,' she continued with a sigh, 'it might always spring up in the mind of the wrong-doer like the east wind in the desert, and stifle every evil with its hot breath!'

'In that case,' added Percival, whose severity had gradually relaxed, 'I suppose you think there would be some hope of such a rogue as Johnson! But come, you bade me God-speed when I departed on my unlucky

errand, and it is but right you should know what has occurred.'

Percival then informed his wife that the guarantee to which they had trusted was utterly useless, Johnson having previously mortgaged the property to his father, who had now, in right of the deed, taken full possession. Everything else to which the creditors might have preferred a claim, was secured with equal cunning—even the household furniture being seized, under a pretended distress for rent; and not a single good debt that he could hear of towards paying the expenses of a commission of bankruptcy.

This account was disheartening enough; but their own affairs needed every energy. It was certain the satisfaction of every demand would leave them houseless and penniless. Should they now candidly avow the circumstances, and pay the uttermost farthing, or temporise with their creditors, in order to make advantageous terms? The mazy labyrinth of policy had already been tried; and it was at length heroically determined to trust in the simplicity of right conduct. A meeting was therefore immediately summoned, and the unreserved assignation of their property, in house and in trade, freely offered. One creditor alone advocated harsher proceedings; but the feeling of mercy prevailed, and Percival's offer was unanimously accepted. Tom Mason, with refined generosity, secretly offered the creditors a sum of money for the household furniture, which was accepted, and so their homestead was untouched. But many years elapsed before Percival was firmly re-established, and many sore trials were overcome, in none of which—to his lasting honour, and for the encouragement of others similarly circumstanced, be it spoken—did he forfeit his good name by again yielding to the vicious policy of 'accommodation.'

LITERATURE OF THE MIDDLE AGES.

Two interesting volumes of essays on subjects connected with the history, the literature, and the superstitions of the middle ages, have recently been published by Mr Thomas Wright, well known for his researches in this department of antiquities.* In these volumes we find many curious odds and ends of information, collected and arranged in a most agreeable manner, as well as much lively criticism and ingenious speculation on historical points. As the middle ages are a subject with which our readers are not likely to be more familiar than most of their contemporaries, a few of Mr Wright's illustrations will no doubt be welcome to them.

The first essay is one on Anglo-Saxon poetry; and, contrary to an opinion which we have sometimes heard expressed, it is here shown that, in the literary remains of our Anglo-Saxon ancestors, there are many things worth preserving; and consequently, that the devotion of a few men in a generation to Anglo-Saxon scholarship, is by no means a waste of industry. 'The prose writings of the Anglo-Saxons,' says Mr Wright, 'are numerous, frequently not very interesting, yet often filled with noble sentiments and acute observations. First, both for elegance and purity of language, stand the works of Alfred, which, as they remain to us, consist chiefly of translations; sometimes (as in the case of the Pastorale of Gregory, as yet unprinted) of authors who are not now very valuable, but always in his manner of paraphrasing the original, and in his own observations, which are by no means sparingly interspersed, showing us how the great and noble mind of our king improved everything on which he put his hand.'

The Anglo-Saxon poems Mr Wright divides into two classes—those composed while the Anglo-Saxons were yet Pagans, and those composed after their conversion to Christianity. The older poems, he says, are bolder, freer, and more original than the later ones. The only complete specimen of the former extant, is the poem of Beowulf the Geat—a monarch supposed to have reigned over the Angles in Sleswick and Jutland a considerable time before the Saxon invasion of England. This composition must, therefore, have been brought into England by the Angles, where, no doubt, it was modified into the form in which it is now preserved. Mr Wright has given a short version of it, acting on a principle which might be applied with advantage in the whole field of our pre-Elizabethan literature; namely, that the only way in which those fine antique compositions can be turned to popular account in the present day, is by preparing careful abridgments of them in spirited and musical prose. It is in this manner that our author has treated the Anglo-Saxon poem of Beowulf. 'The poem,' he says, 'is a magnificent and accurate picture of life in the heroic ages. Its plot is simple: a few striking incidents, grandly traced, and casting strong and broad shadows, form the picture. It is a story of open, single-handed warfare, where love is never introduced as a motive of action, or stratagem as an instrument. Beowulf, like Hercules, seeks glory only by clearing the world of monsters and oppressors. A report had reached him that the court of Hrothgar, a Danish king, was infested by an unearthly monster, the grendel, which nightly entered Heorot, the royal hall, and slew the warriors in their sleep. The emulation of the Geatish prince was raised. He felt himself equal to the task of combating the depredator; for, as the story tells, he possessed the strength of thirty men; and, with a chosen band of his followers, he embarked for the Danish coast.

"The men pushed out the bound wood (the ship). Went then over the deep waves, driven forwards by the wind, the foamy-necked ship, likest unto a bird; till, about the hour of one on the second day, the twisted vessel had so far proceeded, that the voyagers saw land; the sea-cliffs glittering, the steep hills, the broad promontories."

On his name being announced to King Hrothgar, who was well acquainted with his family and his renown, the hero was ushered into the royal presence, to give an account of his mission. Beowulf then related to the king, in a set speech, how the report of the grendel's depredations had reached his country; how his companions in arms, who had often witnessed his valour, and the success of his exploits, had counselled him to go to the assistance of the unhappy Danes; and how he was now come to offer his aid against the monster which persecuted them; and ended by expressing his resignation to the fate which Heaven might send him in the encounter. "If I fall," says he, "it will be in the performance of my duty"—

"Thou needest not to hide my hafela, but he [the grendel] will have me stained with gore. If death shall take me, bear forth my bloody corpse; remember to bury me; let the solitary passenger eat unmournfully; mark my fen-dwelling; thou needest not about my corpse-feast to care longer. Should the war take me, send to Higelac the best of war-coverings, the most precious of clothing—that which guardeth my breast: it is the legacy of Hrædla, the work of Weland. Fate will always go as it must."'

Hrothgar is but too glad to accept the offer of Beowulf; and after entertaining him with an account of the depredations of the grendel, invites him and his companions into the hall, where the feast is spread. There are envious and jealous persons everywhere, even, it appears, in a Scandinavian court; for while the hero is feasting with King Hrothgar, up rises one Hunferth, the son of Ecglaf, and 'makes a quarrelsome speech, because to him the journey of the bold seafarer, Beowulf, was a matter of much annoyance, seeing that he was unwilling to grant that any other man should possess more reputation in the world under the heavens than himself.' Among other things, Hunferth twits Beowulf with the recollection of a certain swimming-

* Essays on Subjects Connected with the Literature, Popular Superstitions, and History of England in the Middle Ages. By Thomas Wright, M.A. F.S.A. 2 vols. London: John Russell Smith. 1846.

match, in which he had been engaged with Breca, and in which, after seven days' conflict with the waves, he had been fairly beaten by the said Breca. He, Hunferth, is far from denying Beowulf's courage; only it will be better for a man who lost that swimming-match to have nothing to do with the grendel. This speech of Hunferth's naturally calls Beowulf to his feet. Lo, my friend Hunferth, he says, thou art drunk with beer; and as for that long story of thine respecting my swimming-match with Breca, I will give thee the true version of it. Breca and I, when we were mere boys, challenged each other to a friendly swimming-match; and we accomplished it thus.

'"We had our naked swords hard in our hands when we rowed upon the deep; we thought to defend ourselves against the walruses. He could not, in any degree, more swift on the deep, swim far from me over the waves of the sea: I would not from him. There we two together were on the sea the space of five nights, until the flood drove us asunder: the boiling fords, the coldest of storms, the darkening night, and a wind from the north, fiercely turned us away; rough were the waves. The courage of the sea-fishes was excited: there my body garment, hard-locked by the hand, gave me aid against foes; my twisted war-dress lay upon my breast, furnished with gold. The variegated enemy dragged me to the bottom; he had me fast grim in his gripe: nevertheless it was granted me that I the villain reached with my weapon. With my war-bill, the mighty sea-beast received the war-rush through my hand."'

Beowulf, after continuing much longer his account of the swimming-match, and of his various exploits, then and at other times, against sea-monsters, concludes by expressing his astonishment that the grendel still continued to infest the coasts of King Hrothgar, seeing that Hrothgar had among his subjects so valiant a personage as his friend Hunferth thought himself to be. At length the feast is ended, and Hrothgar and his courtiers withdraw, leaving Beowulf with his companions to guard the hall during the night. In the dead of night, who should come but the grendel in person, who, supposing Beowulf to be asleep, attacks him. Beowulf, however, is not asleep. A terrible struggle ensues; the monster at length receives a mortal wound, and rushes out, making for its den. The following day is spent in rejoicings, which, however, are interrupted by the appearance, during the night, of the grendel's mother, who, in revenge for the death of her offspring, snaps up Æschere, the prime minister, or favourite counsellor of Hrothgar, and then retires to her cave under the sea. Beowulf follows her to this submarine residence; fights and kills her; and comes up again to receive the applauses and the gifts of Hrothgar before returning home. After a life of similar adventures, Beowulf at last perishes gloriously, in his old age, in an encounter with an enormous fire-drake.

Other specimens of Anglo-Saxon poetry are given by Mr Wright; but what we have quoted is, we presume, sufficient for our readers. Before leaving this part of the book, however, we may remark, that the opinion which we perceive Mr Wright entertains, in common with almost everybody else, that our present English language is a mere modification of the old Anglo-Saxon, produced by the lapse of time, and the introduction of Norman words, has recently been controverted. It is maintained by some, that a language substantially the same as our present English was spoken by the common people of England during the whole Anglo-Saxon period, and therefore from the time of the possession of the island by the Romans; that Anglo-Saxon was *not* the general language of the English people from the sixth to the eleventh century, but a learned language, spoken at court, and by the upper classes, just as subsequently the Norman was; and that, for some thirteen centuries at least, our present idiomatic English has been the popular and rudimental tongue in this island, spoken contemporaneously first with Latin, then with Anglo-Saxon and Latin, then with Norman-French, Anglo-Saxon, and Latin—all these being mere partial or professional languages, from which English has freely borrowed words and phrases, but of which it is wrong to say that English is historically a compound. This is a somewhat daring theory, and we are not competent to pronounce a judgment upon it, although the point in dispute does not seem to be one which it would be impracticable to settle, supposing that due pains were taken.

The second of Mr Wright's essays is one on Anglo-Norman poetry. 'If,' he says, 'the Normans ever had a literature of northern origin peculiar to themselves, it seems to have been nearly forgotten before their entrance into England, where their literary productions were formed upon the models presented to them by the language which they had then adopted in place of their own. Their first romances were those of Charlemagne and Arthur.' Many of their compositions are of a humorous kind called *fabliaux*. During the thirteenth and fourteenth centuries, these fabliaux were produced in abundance in France, and circulated, by means of the minstrels, over all parts of Europe where French was understood. 'Many of them, however, bear internal evidence of having been written in this island. The object of a fabliau is generally to provoke laughter and mirth—some pleasant joke, some crafty stratagem of knight or clerk to cheat a villan (that is, rustic); some licentious amour; or some ludicrous scrape into which those persons had fallen in the attempt, is their most common subject. Sometimes, indeed, the case is reversed; and it is the peasant, the lady, or the lady's husband, who practises the deception—the knight or clerk who is the dupe.' The most common subject of ridicule is the villan.

'It was, after all,' says Mr Wright, 'a strange texture of mind that of our forefathers of the middle ages, capable in the same person of presenting, at different times, and under different emotions, an unbounded diversity of character. At one time, all generosity; at another, giving loose reign to the most merciless cruelty; now, exemplarily pious and devout; and then again giving itself up to the excess of licentiousness. The extremes of profligacy and piety seem, indeed, to have been then by no means difficult of reconciliation; and in the same manuscript, written by the same hand, we often find religious poems mixed with fabliaux equally disgusting. Their religion, however, was extremely passive; the line of demarcation between right and wrong is not over-distinctly traced; and even the religious stories often give more encouragement to vice than to virtue.' As an example of one of these stories, our author quotes the following:—'At a certain abbey were a number of workmen, carving, in stones, figures of saints and devils; and the sacristan, who was looking on, took a strange fancy of carving a devil himself. To work he went, with hammer and chisel; and, by great care and study, he succeeded in making a fiend so passingly ugly, that no person could look at it without terror. Delighted with his performance, he retired to his couch perfectly satisfied with himself; but at midnight he was roused from his slumber by a terrible noise in his cell, and, lo! there was the Evil One himself. "Wretch!" cried he, "why hast thou made me so ugly?" and he threatened the poor monk vehemently, unless he would promise to mend his work. Three nights did the devil renew his visit, with menaces more dreadful every time; and always was he defeated and put to flight by the brother's holy water.' The devil, determined to have revenge, causes the sacristan to fall in love with a fair widow, dwelling near, who persuades him to steal all the abbey plate, and fly with her to a distant land. 'The sacristan, laden with the plunder, was on the way to join his mistress, when the devil entered the abbey, awakened the whole fraternity, and announced that the abbey had been robbed. The monks left their beds in haste, overtook the offender, and put him in prison. The devil again appeared before the sacristan, reproached him for his former obstinacy, and promised still to deliver him, provided he would promise to deface his image, and make one handsomer in its place. The monk agreed willingly to the proposal; the tempter took his place in the dungeon, and he

sought his couch; and next morning, when the monks found him quietly performing his duties in the chapel, and would have led him back to prison, he professed an entire ignorance of what had passed. They immediately, suspecting that some delusion had been played upon them, went to the prison, found there the Evil One in the garb of a sacristan, and instantly came the father-abbot, fearfully armed with cross and holy water, to put the enemy to confusion.

"From holy cross quick fled the devil
(The monks I guess were not o'er civil):
Against the wall he stumbled, souse!
Knocked down a corner of the house,
And then, as 'twere in vengeful mood,
Snatched up a brother by the hood.
The monk himself was fat and heavy
(Perchance the largest of the bevy);
His hood gave way, and, sad to tell,
Right on his brethren's heads he fell,
Who, as they stared in sore confusion,
Were all knocked down by the concussion."

The monks then hastened to the monastery, to apologise to the sacristan for the evil opinion they had formed of him; and the latter, according to his promise, brake in pieces his ugly devil, and laboured hard to form one which might be less objectionable to the personage whom it represented.'

Passing an essay on the 'Chansons de Geste, or Historical Romances of the Middle Ages,' we come to one of the most interesting chapters of Mr Wright's work—that on the Proverbs and Popular Sayings of that era. 'England,' he says, 'is still extremely rich in proverbs, as well as in popular superstitions. Both bear strong marks of a northern origin; and it is probable that not a few of them were as familiar in the mouths of our Saxon forefathers, who came in under the banners of Hengist and Horsa, in the fifth century, as they are in those of our contemporaries of the nineteenth. Of our proverbs, however, many have been introduced, at a comparatively modern period, from external sources, and many have arisen from circumstances and ideas of a later growth, so that it is interesting to us to know not only our own proverbs at different periods, but also those of surrounding nations.' One of the oldest collections of proverbs extant, is that published from the manuscript in Paris in 1831, under the title of 'Proverbes et Dictons Populaires.' This ancient tract 'begins with an enumeration of the appropriate names for an assembly of people of different ranks and orders, as also of various kinds of domestic animals: as an "assembly of knights," a "company of clerks," a "mob of villans," &c. in the application of which our forefathers seem to have been very exact. Next follows an enumeration of proverbial phrases, which had become characteristic of certain orders of people. The greediness of the priesthood gave rise to the saying, "The avarice of the ecclesiastics"—"*Avarisce de provoire.*" The white monks were distinguished by their covetousness—"*Convoitise de moines blancs;*" and the black monks by their ambition and jealousy of others—"*Envie de moines ners;*" the Templars by their pride—"*Orgueil de Templiers;*" and the Hospitallers, or Knights of St John of Jerusalem, by their vanity and presumption—"*Boban d'Ospitaliers.*" We learn also, from these sayings, that the chapters of canons were proverbial for the discord and dissensions which generally reigned amongst them—"*Descort de chapitre.*"'

There are proverbs, many centuries old, which give the reputed national characteristics, at that ancient date, of the various peoples of Europe. The wisest men are said to be those of Lombardy; the wisest merchants those of Tuscany; the most deceitful people in the world, the Saracens; the greatest traitors, the Hungarians and the Greeks; the most slavish, the Sclavonians (the word *slave* itself being derived from a Sclavonic term meaning *glory*); the most irritable people were the Germans; the most frank and open, the French; the most stupid, the people of Bretagne; the most inquisitive, the Normans: the finest women were those of Flanders; the finest men, those of Germany; the largest-bodied men were the Danes; the best drinkers in the world were the English; the most wandering and beggarly people in the universe, the Scotch; and the wildest and most intractable, the Irish.

It is remarkable how many proverbs are common to different nations; how many, for instance, which we believe to be peculiar to Scotland, or even to particular districts of Scotland, are found in the same, or nearly the same, literal form, in Germany, in France, and in Spain: the common possession of a proverb sometimes seeming to establish a connexion between spots distant hundreds of miles, and holding no intercommunication. The origin of proverbs, and the manner of their distribution over Europe, form a puzzling subject of speculation. Mr Wright contents himself with criticising, or rather satirising, a theory of the origin of proverbs, propounded by Mr John Bellenden Ker, and which is certainly one of the most extraordinary fancies ever made public. In order to understand Mr Ker's theory, first published in 1834, in the form of 'An Essay on the Archæology of our Popular Phrases and Nursery Rhymes,' let our readers scrutinise attentively, for we cannot ask them to enunciate, the following apparent piece of gibberish:—

'Guise guise gae'n daer!
Weêr schell-hey waené daer
Op stuyrs nendoen stuyrs;
End in mêlyd is schem baer.
Dere ei! met een ouwel-man!
D'act, wood n'aet, sle ee is Par-heers.
Hye tuck heim by die left legghe
End seer ruwe hem doe aen stuyrs.'

This, according to Mr Ker, is a lampoon or satirical effusion, current many centuries ago among the English or Anglo-Saxon peasantry, against the monks and priests who oppressed them by their exactions, in the form of rates, &c. Its meaning, somewhat freely rendered into modern language, is given by Mr Wright as follows:—

'Hear their insolent clamour!
The committee, what axes
From us church-ridden elves
Nought but rates and new taxes.
There they sit in the tap-room,
Nor once think of compassion:
We must pummel their noddles,
If they grind in this fashion.
Let us stop their long speeches,
Their high vaunting words;
And when they're gone to pot,
We shall all live like lords.'

Such lampoons became at length so rife, that they did positive harm; and the friars bethought themselves of some way of counteracting their effects. 'The remedy they devised,' says Mr Ker, 'was ingenious, and worthy of the astuteness of friars. An unparalleled and constant corruption of the dialect in which they were composed, was taken advantage of, and the invective of the lampoon was gradually undermined by the introduction of a harmless, unmeaning medley of a precisely similar sound and metre, in the latest forms of the altered dialect; till in time the original import was forgotten, and its venom and familiar use replaced by the present nursery rhymes.'

Thus, in the instance of the obnoxious lampoon quoted above, what the friars did was as follows: they prepared a doggerel verse, composed of the corrupt English which was beginning to be spoken, exactly resembling in sound the old lampoon, but having quite an innocent meaning. The verse so prepared ran as follows:—

'Goosy goosy gander!
Where shall I wander?
Up stairs and down stairs,
And in my lady's chamber:
There I met an old man
That would not say his prayers;
I took him by the left leg,
And threw him down stairs.'

This rhyme, sounding pleasantly enough, the stupid peasantry accepted willingly, allowing themselves to be cheated out of the bitter old lampoon. In a similar way

the other lampoons were withdrawn from circulation, and replaced by harmless rhymes: the device of the friars, it will be seen, exactly resembling that by which a sailor manages to steal rum on board a ship. He places a bottle full of water, with the neck downwards, over a pipe inserted through an orifice in the cask, comes back in an hour or two, and finds the bottle full of the spirit, which has displaced the water, in virtue of its inferior specific gravity. Mr Ker extends the same explanation to our common proverbs and popular sayings. Thus, 'We will bell the cat' is, he says, a priestly substitution for the dangerous political reflection, *Woe wel beul, dije guit;* which means, 'And though there is a hangman, yet you see robbing still goes on.' 'Hobson's choice' is an exchange for *Op soen's gheeijsch*, 'At the command of a sacrifice.' Nay, the name 'Canterbury Tale' is a corruption of the profound idea which figures thus in Dutch, *Gaen-deur-op-eere-te-heel;* that is, 'To get through by the help alone of reiterated appeals to honour.' 'He took the bull by the horns,' was originally, *Hie tuck tije bol by, die hooren's;* the meaning of which is, 'Here head calls contrivance in, that is as it ought to be.' 'It makes my blood run cold,' was, *Et muyck's meê bloed er een kule;* which signifies, 'The muck, when blood is joined with it, soon grows hot;' a dreadful revolutionary sentiment, it will be observed. Falstaff's 'men in buckram' are not mere rogues in buckram suits, as we have ever imagined them to be: they are a much more profound thing; they are *Men in backe ruim;* a Dutch phrase, which means, 'Men who are contained within the space of the mouth that brags of them;' that is, fancy or ideal people. 'He was as busy as a hen with one chicken,' is also deep Dutch; it is *Hij wasse als boose, als er her wijse wan schick in;* meaning, 'He became quite furious when it was proved to him that all which could come from what he had been so busy about must be a failure.' To conclude with one specimen more of a nursery rhyme:—

'Jack Sprat
Had a cat:
It had but one ear;
It went to buy butter
When butter was dear.'

This very innocent effusion is a monkish substitution for the following formidable stanza:—

'Jackes praet
Huydt er guit;
'Et huydt Bot wan hier;
'Et wint toe Baei Bot er;
Wee 'n Bot er! Wo aes dij hier!'

Which, being translated, sounds somewhat thus:—

The tales of the parson,
Faith! they're all mighty good!
They fill the rogue's belly
With poor cloddy's food.
These smooth-faced tormentors
Live upon cloddy's labours,
While cloddy, poor soul!
Must go beg of his neighbours.'

Such is Mr Bellenden Ker's extraordinary theory of the origin of proverbs and nursery rhymes: they are substitutions, by the monks, of innocent or unmeaning English sentences for old lampoons and political maxims in the Dutch or Anglo-Saxon languages. If it could be thought to require any serious refutation, the following sentences from Mr Wright will be sufficient. 'Mr Ker,' he says, 'has committed an error in attempting to raise a theory to explain the origin of popular proverbs before he investigated their history. He should have known that our own proverbs have, in the course of some centuries, more or less changed their forms; that words which had become obsolete had often been rejected for others of the same signification; that, with the gradual change from Saxon to English, the sentences which expressed these proverbs have changed often in form and construction; that older proverbs have themselves become obsolete, and been succeeded by later ones. If he had considered well all these circumstances, the similitude which he thinks he has discovered between the proverbs in their more modern form, and the Dutch sentences which he has constructed, would itself have raised in his mind a suspicion of the falseness of his theory. In addition to this, he ought to have known that these same proverbs, which we find in our language, occur also in the other tongues of the Teutonic stock, and in French—nay, even that they are found in Dutch itself, with the same sense and application as in English.'

A WORD FOR THE WORDLESS.

THERE is nothing more common than to ascribe the conduct of many of the lower animals to feelings of hatred, revenge, cruelty, and the like—evil passions which, unfortunately, are too often manifested in human behaviour. That this is an error, and a glaring one too, is abundantly evident, unless we presume a moral responsibility in the brute creation, or regard as evil those instincts with which they have been endowed by the Creator for their support and guidance. This ignorant transference from the catalogue of our own crimes has been the cause of much injustice and cruelty towards the creatures that surround us, and has served to perpetuate within man a savagery which is at utter variance with those principles of love and kindness which he professes to follow. Nor is it a mistaken view, participated in merely by the vulgar and uneducated; for poets and moralists, whose vocation is peculiarly that of humanity, seldom rise above the error, but indulge in epithets towards the inferior animals calculated not only to cherish the most malignant feelings, but to awaken them where they did not formerly exist. Thus the poet of 'the Seasons'—who, though in one place singing,

Let no presuming impious railer tax
Creative Wisdom, as if aught was formed
In vain, or not for admirable ends—

is himself guilty of so many libels against the brute creation, that the most prejudiced jury could hardly find an extenuating circumstance whereupon to recommend him to mercy. We mean to take a peep at his principal poem for a few proofs of this assertion.

While denouncing the change from a strictly vegetable diet to one of a mixed nature—which denunciation, by the way, is nonsense—the poet laments the fate of the sheep and ox, and very tenderly asks what they have done to merit death at our hands? But while thus the advocate of a mistaken mercy—seeing that these animals have been given for our use, and that we are guilty of no cruelty, so long as we put them to no unnecessary torture—he in the same breath tells us—

The beast of prey,
Blood-stained, deserves to bleed—

a maxim which would justify the extermination of every carnivorous animal, not on the plea of necessity, but on the ground of the most sanguinary vengeance, and without reflecting that the beast of prey is quite as necessary to the harmony of creation as is the beast of burden. 'The beast of prey deserves to bleed.' Why? Because he is 'blood-stained;' and, therefore, man is to demean himself to the level of the brute, and stain himself with its blood in turn. Most curious morality! The whole scheme of creation is one of relationship: so far as our own safety or comfort demands, reason justifies the repression of creatures that become noxious to us; beyond this, every step is cruelty and error. Error, inasmuch as the undue diminution of the carnivora would give undue preponderance to other classes, which would, in turn, interfere perhaps more seriously with our comfort. But it is not our own comfort alone which must be taken into account. It is a narrow and imperfect philosophy which views the inferior creation as destined merely to subserve the purposes of man, and which sees not in the rest of the scheme a scene of joy and enjoyment, without any reference whatever to man's existence. Besides, the poet errs on the ground of Christian morality: his maxim is, blood for blood—a precept of

vindictive cruelty, at utter variance with that spirit which would overcome evil with good, and bless those that would despitefully use us.

Nor is it alone the larger beasts of prey—your lions, tigers, and wolves,

> Burning for blood; bony, and gaunt, and grim—

that have cause to complain of this poetical injustice; the bard is equally abusive of the poor spinner of a cobweb. Only mark with what vehemence he vents himself as he turns his eye to the window-sash—

> Where, gloomily retired,
> The *villain spider lives, cunning and fierce,*
> *Mixture abhorred!* Amid a mangled heap
> Of carcases, in eager watch he sits,
> O'erlooking all his waving snares around.
> Near the dire cell the dreadless wanderer oft
> Passes; as oft the *ruffian* shows his front.
> The prey at last ensnared, he dreadful darts,
> With rapid glide, along the leading line,
> And fixing in the wretch his *cruel* fangs,
> Strikes backward, grimly pleased: the fluttering wing
> And shriller sound declare extreme distress,
> And ask the helping, hospitable hand.

The italics are ours, but the sentiments are entirely the poet's, in whose humanity few, we believe, would be inclined to participate. According to his views, the little hunter, whose wonderful meshes, whose dexterity and perseverance, have been a fertile theme of the naturalist, and whose toilful ingenuity has often relieved the tedious hours of the prisoned captive, is a villain, a ruffian—cruel, cunning, and fierce—a mixture so abhorrent, that the sooner you crush him against the wall the better. Such, indeed, must be the feeling that arises in the mind of the young who may unhappily take their creed from the poet of 'the Seasons.' 'Cunning and fierce, mixture abhorred,' grins the schoolboy, and next instant the 'villain' spider is plastered against the beam whence he had suspended his cobweb. The simple and gentle philosophy of Uncle Toby, who, opening the window, let forth the fly which had buzzed about his nose during dinner, with a 'Go, poor wretch; the world is wide enough for us both!' has little chance against the violent declamation of the poet: an apology for our crimes is more eagerly laid hold of, than a command to be virtuous. After all, what do the denunciations of the poet amount to? Why, merely to a strong expression of ignorant impulse. The spider, in every point of his character and organisation, is formed, and formed alone, for the kind of life he leads: his wonderful apparatus, and reason-like instincts, were given him for the capture of insects, and in exercising these, he only fulfils the intentions of his beneficent Creator. The spider could no more subsist on other kind of diet, than the lion could on straw; and when he fixes his fangs in a helpless fly, he has no more idea of cruelty, than the poet had when he chanced to thrust his fork into the wing of a roasted turkey.

Such instances of poetical libel by the author of 'the Seasons' are by no means rare. He cannot speak of a party of gadflies, sporting and quadrilling it in the noonday sun, without denouncing them as 'angry;' nor of a snake, coiling itself for pleasure among the grass, without abusing it as a 'monster'—a child of 'vengeful' nature: as if nature, forsooth, created one part of her works to be avenged on the other; or, in the words of the old adage, 'cut off her nose, to be revenged of her face.' Again, the wolf is a 'ruffian,' the brindled boar a 'monster,' and the fox a 'villain'—all very offensive and improper epithets, which decent society very sparingly, if at all, admits into its qualifying vocabulary. Nor is this the worst of it: bad names are bad enough, but, says the proverb, 'they break no bones;' and the poor brutes might have cared but little for the poet's abuse, had he not urged on their murder in such a savage style as the following:—

> Slunk from the cavern, and the troubled wood,
> See the grim wolf; on him his shaggy foe
> Vindictive fix, and let the ruffian die:
> Or growling horrid, as the brindled boar
> Grins fell destruction, to the monster's heart
> Let the dart lighten from the nervous arm.
> . . . . . Give, ye Britons, then,
> Your sportive fury, pitiless, to pour
> Loose on the nightly robber of the fold;
> Him from his craggy winding haunts unearthed,
> Let all the thunders of the chase pursue.

And all this, too, in the face of a very tender and tearful passage, in which he deprecates the chase of the stag, hare, and so forth, proclaiming—

> These are not subjects for the peaceful Muse,
> Nor will she stain with such her spotless song:
> Then most delighted when she social sees
> The whole mixed animal creation round
> Alive and happy.

Thus inconsistent, too, is the author of 'the Seasons.' Can we suppose him to have been sincere in both cases; or was he only, as an artist, eager in search of strong and impressive images, with little regard to their correctness or harmony with each other? So, we fear, it is with too many of the tuneful brethren; the mere creatures of feeling and passion, revelling in these, and too often subordinating the calmer—though, in truth, not less poetical—dictates of enlightened knowledge.

Let us not be misunderstood. 'The Seasons' abounds in many, very many humane and exalting views of nature: what we censure is the frequent application of the worst of human epithets to the natural and instinctive conduct of the brutes—a transference wholly erroneous, unless we are prepared to gift them with a portion of human responsibility. How the bard of 'the Seasons' might have regarded this alternative, we cannot tell; but this we feel assured of, that no one, entertaining correct views of nature, can consider his treatment of many of the brutes as otherwise than libellous in the extreme, and tending to convey anything but a just view of the designs of God in the animal creation. Some may no doubt regard it merely as a little too much colour in the brush; for our own part, 'the Seasons' would be amongst the last text-books we should place, without comment, in the hands of a child, were we training him in the paths of a broad and generous humanity.

DR CARUS AND THE ENGLISH.

Two summers ago, the king of Saxony, with a select suite, took a run through the principal districts of our island, visiting such objects of interest as lay in his route. Since then, the royal physician, Dr Carus, has given to the German public an account of the journey, with which, in an English dress, we are now presented by the publishers of the 'Foreign Library.'* Individually or nationally, we are naturally curious to learn the opinions of others respecting us, and under this impulse we turn to the doctor's jottings, which, we may hint at the outset, are of no ordinary character. The writer is evidently one of those men who, whatever untoward circumstances may assail them, are not to be depressed, at least through any want of a good opinion of themselves. As may be expected, therefore, a buoyant self-confidence runs through the whole of his narrative, which would become decidedly offensive, were it not for a vein of good-humour and cordiality which tempers the indiscretion. The doctor is a physiologist, a speculatist in morals and religion, an artist, antiquary, and a hundred things besides; so that, if the portraiture of our nation is not complete, it is owing more to the stubbornness of the material, than to any deficiency in the qualifications of the draughtsman. Passing, however, his descriptions of scenery, criticisms on

* The King of Saxony's Journey through England and Scotland in the year 1844. By Dr C. G. Carus, Physician to his Majesty. London: Chapman and Hall. 1846.

works of art, and much of that light gossip which necessarily belongs to such narratives, we shall glance at the opinions which concern us principally as a people.

Setting out with the maxim, that the history of a people and their peculiarities can be only rightly comprehended when we have gained a true idea of the *physical* characteristics of their country, Dr Carus devotes some space to the geography and geology of our island, and then proceeds to the consideration of the 'remarkable and highly-inventive race of men' who inhabit it. As he always proceeds upon philosophical grounds, he lays down, as a principle, that there is nothing more favourable to, or promotive of, the development either of an individual or of a nation, than to be sprung from a vigorous, fine, and intellectual stock. 'The peculiarities and high importance of the people of England are, therefore, mainly to be sought in the descent of the English from the mixture of so many different races, all of a vigorous character; the intermarriage of the original inhabitants of England—the Cymri or Britons—with the Romans, Norwegians, Danes, Normans, and Germans, from whence the new British, or, properly speaking, English people, sprang. When we look at the subject from this point of view, it is remarkable to perceive that those districts of Great Britain in which the original races exist with the least admixture of foreign nations, and have still preserved the use of their original Celtic or Gallic language, as in Wales and the Highlands of Scotland, are those the inhabitants of which cannot in any respect be compared in mental energy and development with those who, properly speaking, belong to the new British race; and are constrained to yield to the genuine English, whose language is a compound, derived from Roman, Norman, Scandinavian, and German roots. It is this little England—this England containing about 15,000,000 of inhabitants—which has made itself the centre of a kingdom greater than any in the civilised world, whose provinces surround our globe; and even excluding the shifting, but still numerous, population of Hudson's Bay, reckons a population of above 200,000,000; whilst Russia, the most powerful empire on the continent, only reckons about 64,000,000 of subjects.

'As to the race, the German and Scandinavian elements are clearly discernible in the physical constitution, in the strongly-built frame, above the middle size, the oval form of the skull, the fair skin, and the great preponderance of brown and light hair over black. These elements are even more obvious in the public institutions of the people. On examining this point more carefully, the old German customs and the old German laws will still be seen not only to exist, but to flourish in a multitude of institutions, which have been completely lost in Germany itself, either through the constant and varying influences of other nations, or sometimes through indolence of character in the people themselves. The various forms of administration throughout the country afford proofs of this remark: every district, every town, every parish, possesses a species of independence; elects its own parish, local, or municipal officers; and, by means of its representatives, enjoys and exercises a great share in the general administration of the whole country; in a word, it possesses those great rights which belong to a free constitution. Then the public administration of justice and trial by jury, the great preponderance of open and verbal modes of transacting business over written, the unlimited, free, and public expression of individual opinion upon all subjects, the performance of administrative duties in many cases without salary, and the holding of offices which are mere signs of public confidence, and of a prominent position, all enter into this inquiry. It would, indeed, require a long and careful examination, accompanied and supported by strict historical research, to be able to declare what of all this has passed from the Scandinavian, what from the Roman, what from the German stock, into the life of the English people. It would, then, unquestionably appear that the Roman forms by far the smallest element in the composition, and the German incomparably the greatest.'

Having thus decided how much of our greatness we owe to a German paternity, the next principle laid down is, that quiet and retirement in youth, either of individuals or of nations, is essential to the development of a powerful and self-relying character—a theorem which we readily grant him. Being confined to the limits of their island, and thus almost wholly withdrawn from contact with other nations, the English—such is his reasoning—had time to lay the foundation of a physical individuality, which was capable of being developed into a great and important character, before they came into much active intercourse with other people. 'One result of this retirement has been, that a multitude of singularities, of customs, usages, institutions, and manners, both in public and private life, have taken such deep root in England, as to become immovable; and this might seem the more astonishing in a nation which carries on the most active intercourse with all parts of the world, and with nations of the most different habits, customs, and laws, did we not bear in mind that almost all these characteristic singularities date from a period when the people were absolutely isolated, and their forms of life were developed to full maturity from within themselves; and that, therefore, there is a universal inclination to hold firmly by that which, in other countries, is subject to continual change from the influences of neighbouring nations, and sometimes changes of itself. In recent times, it is true, comforts and luxuries, in all their various relations, have enormously grown and increased in England; but the basis of all these usages and customs may be clearly shown to rest upon others, handed down from time immemorial. These very developments, therefore, always assume a peculiar historical character, and make obvious the reason why the English themselves have such intense pleasure in thinking of, and designating their country as, *Old England*.' Such is Dr Carus's theory of our conservatism; for, notwithstanding all our power and progress, we are really the most conservative nation in Christendom.

In close connexion with this long-cherished principle of exclusiveness and retirement—which lies at the foundation of the English character—our author places the subject of dwelling-houses; and we only wish that his views on this matter were as enthusiastically participated in by every one of ourselves. 'Up to the present moment, the Englishman still perseveres in striving after a certain individuality and personal independence, a certain separation of himself from others, which constitutes the foundation of his freedom. This, too, was completely an ancient German tendency, which led our remote ancestors to prefer the rudest and most inconvenient, but isolated homesteads, to the more convenient and refined method of life in aggregation: it is this that gives the Englishman that proud feeling of personal independence, which is stereotyped in the phrase, "Every man's house is his castle." This is a feeling which cannot be entertained, and an expression which cannot be used, in Germany or France; in which countries, ten or fifteen families often live together in the same large house. The expression, however, receives a true value when, by the mere closing of the house-door, the family is able, to a certain extent, to cut itself off from all communication with the outward world, even in the midst of great cities. In English towns or villages, therefore, one always meets either with small detached houses merely suited to one family, or apparently large buildings extending to the length of half a street, sometimes adorned like palaces on the exterior, but separated by partition walls internally, and thus divided into a great number of small, high houses, for the most part three windows broad, within which, and on the various storeys, the rooms are divided according to the wants

or convenience of the family: in short, therefore, it may be properly said that the English divide their edifices perpendicularly into houses, whilst we Germans divide them horizontally into floors. In England, every man is master of his hall, stairs, and chambers; whilst we are obliged to use the two first in common with others, and are scarcely able to secure ourselves the privacy of our own chamber, if we are not fortunate enough to be able to obtain a secure and convenient house for ourselves alone.'

Another element in Dr Carus's philosophical estimate of our national character, is that suggested by the question—By what age can the English be regarded as, in some measure, represented—by childhood, youth, manhood, or senility? 'There can be no doubt,' says he, 'that, after a very short observation of their whole mode of action and conduct, they must be characterised by the mature, late, but still vigorous age of man. A firm adherence to principles once adopted, a quiet, historical foundation and development, a decisiveness and vigour, a Catonian severity of morals, but, together with these, a great measure of pedantry, and, even as a people, conspicuous and unconcealed egotism, are precisely the very circumstances and conditions which must soon impress themselves upon the mind of the observer, and become consolidated into a firm and decisive judgment.' But this vigour, courage, and decisiveness of character—this stiffness, pedantry, and egotism—are repulsive of all that may be called the poetic element in the spirit of the nation. We are neither poets, musicians, artists, nor philosophers. 'On these grounds, it often appears to me impossible to believe that Shakspeare could have been an Englishman; and his really being so, only becomes intelligible by remembering that, in the time of Shakspeare, a real *merry England* actually existed. It is, moreover, for this very reason too, that there is at present such poverty in the really active pursuit and cultivation of all that deserves the name of the higher arts. England has never produced a single great historical painter, and will scarcely ever produce one. The same is true of sculpture and music.

'As to poetry, England, like other countries, possesses even now, it is true, a great many poets; and men of distinguished talents appear from time to time in the field of events; but the tendency towards the *gloomy side*, the melancholy, or the sentimental, and often even the bitter element of life, is constantly gaining the ascendant; and this fact of itself proves that poetry, properly so called, is a stranger to the country at present. True, indeed, I will not venture to say that the Englishmen of the present day are *destitute* of the spirit and feeling of poetry; for what people are completely in this condition? But these are limited to an earlier period of life, and are regarded as a disease incidental to the development of the mind, rather than as a great poetical view of life, pervading the whole existence, harmonising with the deep poetry of life, and exercising a most important influence upon the whole moral and intellectual character. The prevailing English character is, therefore, by no means destitute of passion and poetry; but all this appears like the early eruption of a volcano, which is speedily exhausted, and then the crater only remains, covered with ashes, hard and dry.

'Everything pertaining to the theatrical arts is almost in a worse condition in England, at present, than even the structural arts and music; and although we can make no particular boast of the state of the drama amongst ourselves, it would not be easy to exaggerate its superiority over the miserable and soulless drama of England. It is something repugnant to one's feelings to see that the people who formerly produced the greatest of all dramatic poets, should now be almost wholly destitute of dramatists, and that the art should share so little genuine sympathy; but a moment's consideration of the whole circumstances of the country, and it no longer remains a riddle. Industry absorbs all the energies of life; with the progress and application of steam-power, not only are thousands and thousands of new productions developed, but the population itself: the number of large towns with 30,000 or 40,000 inhabitants, whose names are yet scarcely known in foreign countries, increases with enormous rapidity; and the regulation, occupation, and supply of all these demand continual and progressive activity. How is it possible that, in the midst of such a tendency of public life, any time should be allotted to the artistical gratification of the finer and more intellectual wants of the human mind?

'For these reasons, even the sciences, considered by themselves, are not objects of pursuit; and least of all in the higher departments of mental philosophy; but they are cultivated zealously and effectually in as far as they are useful, and promote the immediate advantages of life. In England, *natural philosophy* by no means corresponds with the *Natur-philosophie* of the Germans, but consists of a combination of mathematics and physics; and is endured only as such; whilst every truth is decidedly repulsed which is calculated to promote such a free spirit of inquiry, or mental development, as might, in the most remote degree, interfere with, or trench upon, any traditional, political, or orthodox ecclesiastical dogma.' Admitting that there is but too much truth in some of these remarks, we cannot altogether subscribe to the sweeping generalisations of the learned traveller. The elements of poetry and taste exist in the national mind as vividly as ever, with this advantage, that they are now incomparably more widely diffused: it is only the object and aim that is changed; and this Dr Carus, trained and tutored amid a state of things that belong to a bygone era, seems unable to comprehend. Leaving, however, these general strictures—for which, in the spirit of the prayer,

> Oh that some power the gift would gie us,
> To see ourselves as others see us,

we ought to be thankful—we shall now turn to the less studied, and perhaps more truthful, *en passant* observations of the doctor's journey; we say the *doctor's* journey, for *ego et rex* is evidently the style of his Latinity.

We have seen that Dr Carus was prepared to find in the English a remarkable people — vigorous, active, decisive; but when he comes to view their navy, army, institutions, factories, mines, railways, wealth, and sumptuous living, his preconceptions fall infinitely short of the reality. He can afford to scoff at their lack of the poetical element—at their music, painting, sculpture, and theatricals; but the comforts, the substantialities, the power, if we may so speak, of their everyday life, brings him to his knees in absolute idolatry — What a tale I shall tell to my friends in Saxony! It must be observed, however, that, being an attaché of royalty, the doctor moved only among the noble and wealthy—everywhere there was a decking out for the reception: even the public crowds presented themselves in a sort of holiday attire—facts that must be borne in mind in the interpretation of his numerous superlatives. On landing at Dover, the royal party proceeded to the hotel, where, in company with the captain of her majesty's steamer, and the commander of the garrison, they had lunch—*déjeuner dinatoire*. 'The richness and abundance of the plate surprised us Germans, unaccustomed to such displays in our inns; and many national peculiarities in the viands were immediately observable. The rich ox-tail soup, the massive piece of admirable beef, fish of every description, and, together with sherry and port, common at all English tables, genuine porter, which, in consequence of its aromatic bitter, was peculiarly well calculated to repair the discomforts of sea-sickness, from which some of our party had suffered.' Again, when lunching with Lord Amherst at Knowle—'I can truly say that, as I sat down at the rich table, adorned with massive plate, and decked with flowers, and around me the members of the same family that had enjoyed all the pomp of

nobility before the reign of Elizabeth, and in a room hung with the portraits of a long line of ancestors, whose arms were emblazoned on glass in the tall, Gothic windows, I felt as if I were in a dream, and found myself transported into a scene before the age of Shakspeare; and times and things long gone by flitted before my mind.' Further, when his royal master was the guest of our queen at Windsor—'In the evening, dinner was served upon the most splendid scale—even of royal magnificence. What rooms, what pomp, what brilliancy and splendour; the fairy tales realised before my eyes, and all this in an old, gray, weather-beaten castle! Covers were laid for sixty persons, and all were served upon gold. Dr R——, the physician of the emperor of Russia, who sat next to me, told me that such an entertainment was unparalleled even in St Petersburg.' But this wealth and splendour meet him everywhere: this everlasting magnificence is more than German frugality can endure; and so, while at Blenheim, the seat of the Duke of Marlborough, he gets fairly out of humour with it. 'One gets a tolerable idea of the almost extravagant opulence which is here displayed, when I say that, in a large vaulted hall for preserving milk, cream, and butter, a splendid fountain has been erected, to throw up the clearest spring water, which falls down along several basins, growing gradually larger, until it comes to a large basin at the bottom, which is so arranged as to have upon its brink vessels and pans for containing the cream and butter, which thus, in the warmest weather, are kept at the degree of coolness so necessary to these useful kinds of food. In any other place, this fountain would be used to ornament the entrance avenue, whilst here, it merely serves to cool a dairy!' The poetical element again! But we should like to know of Dr Carus, if a nobleman can command a *jet d'eau* for his dairy, as well as for his entrance avenue, why he should not enjoy the luxury of the one as well as the ornament of the other?

Wonderful as was the display of wealth, whether in the halls of royalty, in the dining-room of a public hotel, or in the dairy of a private nobleman, the *tout ensemble* of a London crowd, alike for the gaiety of its appearance, and the respectability of its demeanour, seems to have been no less remarkable. 'Curiosity to see the train of open royal carriages, accompanied by a guard of lancers, had collected such a vast mass of persons along the whole line of road from Buckingham Palace to the station of the Great Western Railway—about half an hour's ride—that every possible position for seeing was occupied. Elegant carriages, often two or three rows deep, were drawn up on the sides of the way, and were intermixed with a great number of ladies and gentlemen, mounted on beautiful horses, who either stopped whilst the court equipages passed, or occasionally accompanied and followed them. The houses, too, were all full of life; windows and balconies in all directions crowded with spectators, male and female; and, in addition to all this, an immense throng of persons on foot—such as is momentarily collected in London—of omnibuses, hackney-coaches, and cabs, which traverse London in all directions in thousands. The crowd at and around the railway station was immense; but, notwithstanding this, the best order was everywhere preserved, partly from a natural love of order in the people themselves, and partly by the activity and good management of a large body of police, distinguished by their simple but elegant blue uniform. The London constabulary are not provided with arms of any description, but merely carry a short staff of office in the breast pocket, which, although short, is heavy, and may, when occasion requires, be used as a weapon both of offence and defence. In the police, however, the people recognise the preservers of peace, order, and law, and cases are very rare in which any opposition is offered, or resistance made, to their authority.' But the grandeur of the city is quite as enchanting as the appearance of its inhabitants. Paris is but a country town in comparison. 'The large and splendid shops in Regent Street, with their enormous plate-glass windows, and looking-glasses in gilt frames, are truly magnificent exhibitions. The perpetual movement and life in the streets, at once so wonderful and exciting. When I think of Paris, and compare it with London, it now leaves on my mind the impression of *a small town!*' Again, speaking of Regent's Park and the public promenades—'Places of public refreshment, coffee-gardens, and the like, without which a German can scarcely form an idea of a promenade, do not exist here, at least in the places frequented by good society. This is quite to my taste, as among us the most delightful places are completely destroyed by being made assembling places for smoking cigars and drinking beer.' Such is Carus, ever astonished and delighted so long as you keep him off the fine arts, metaphysics, and philosophy; but let him once trench on these, and the queen's piper makes sounds (he cannot call it by the name of music) so horrible, that 'no form of apostrophe can characterise it.' The English are prone 'to mistake mere noise for a species of music'—St Paul's is 'one of the most tasteless collections of columns, vaulted roofs, eaves, and statues, that encumbers the earth'—Westminster Abbey is 'great, but not imposing'—the design of the new Houses of Parliament has something in it 'organically irrational'—the workmanship of some silver-plate which he examined was 'neat and skilful, but without genius'—in the Royal Academy's exhibition of paintings he had to 'read in the catalogue all that he did *not* see in the picture:' even the English 'Hurrah' offends him; it is not half so musical as the German 'Hoch! Hoch!' About tastes, however, *nil disputandum*.

But whatever may be our deficiency in these matters, the invention, ingenuity, power, and rapidity of execution which everywhere met him, are really beyond his comprehension. Be it an iron-work in Wales, the dockyard at Portsmouth, a gun manufactory at Birmingham, the post-office in London, or the getting up of the *Times* broadsheet—all are alike marvels to the dreamland of a German idiosyncrasy. Speaking of the post-office arrangements, he remarks—'The English have certainly the art of inventing, in all such matters, capital abbreviations for business, which would often take up much time. Thus there are always printed tables of everything necessary for the house, the kitchen, or the cellar; so that a man, by looking over these lists, immediately sees what he has, or what he wants. In the same way, no one keeps any large sum of money in the house; his banker manages all that; and he has only a little book with cheques, out of which he has nothing to do but tear a leaf, write upon it the sum he owes, and give it to his creditor; and so of other matters.' But our activity, ingenuity, and busy-making may be carried to extremes; so at least thinks Dr Carus. 'The latest newspapers were constantly offered at the stations: we bought some; and the rapidity with which news is here circulated may be guessed from the circumstance, that the *Times* of this morning, just arrived, gave a full and minute account of his majesty's visit to Hatfield House yesterday! In this manner all that takes place at the court in London, visits, invitations, excursions, &c. are particularly chronicled and printed in all the newspapers; and now I see that the reporters, even on their journey, report with the same rapidity. At every station, a person in one of the nearest carriages kept continually looking towards our carriage, and fixed his eyes upon us, as if he were working upon a sketch of the travelling equipage for a wood-cut in the *Illustrated News!* I confess that all this spying and universal small-talk of the newspapers seems to me to be doubly mischievous: first, to the people, who are thus accustomed to trouble themselves about a multitude of trivial circumstances, family affairs, and the most ordinary events; and secondly, for those who are the objects of such incessant prying and observation. Such a people as the English should be far above such littleness.' The doctor is right, and we humbly kiss the rod of rebuke. We certainly ought to be above the littleness

of silly, intrusive gossip, which is edifying to none, and must ever be offensive to some. It is easier, however, to find fault than to correct an error; and Dr Carus ought to have remembered, in penning his narrative, that what is blameworthy in a nation, cannot be very commendable in the case of an individual.

RESISTANCE TO GREAT TRUTHS—JENNER AND VACCINATION.

No more fatal or formidable disease has ever scourged the human race than one—now happily becoming a subject for history—the small-pox. Authoritative evidence has of late years been adduced to show that it existed in the Mosaic period, and in China it has been known from the earliest ages. Most of the fearful plagues which from time to time, on various portions of the earth's surface, have swept myriads into untimely graves, were no other than devastating visitations of this dreaded disease; and even when pursuing its ordinary course, it carried off one in fourteen of all that were born. In Ceylon, whenever it broke out, entire villages were abandoned; and in Thibet, on one occasion, the capital was deserted for three whole years. In the Russian empire, two millions of human beings died of small-pox in twelve months. Bernouilli calculated that fifteen millions fell victims to it every twenty-five years, taking the whole world, or six hundred thousand annually, of which number not less than two hundred and ten thousand were estimated for Europe alone. And to come down to more recent times, the readers of Mr Catlin's work on the Indians of North America will remember the terrible accounts of the destruction of whole tribes by this deadly malady. Regarded as inevitable, it came also to be considered as irremediable, and the world submitted to its ravages as a calamity of fate. In 1714, Dr Timoni of Constantinople published a work on the subject; and to the good sense, courage, and influence of Lady M. W. Montagu, who caused her son to be inoculated in the Turkish capital by Mr Maitland, surgeon to the embassy, England is indebted for the counteracting practice. In 1722, her daughter was inoculated in this country by the same gentleman; and the method was generally adopted until 1740, when it had fallen nearly into disuse; but favourable accounts coming from abroad, it was again revived; and, to propagate the salutary modification, the then Princess of Wales caused two of her daughters to be inoculated. The new remedy, however, met with great opposition. Some denounced it as an attempt, 'at once impious and unavailing, to counteract the visitations of an all-wise Providence;' asserting that, in the case of adults who voluntarily submitted themselves to it, the crime was that of suicide; but in respect to children, 'it was horrid murder of the little unoffending innocents.' It was anathematised from the pulpits as an invention of Satan, and its 'abettors' as sorcerers and atheists. A clergyman of London, named Massey, declared that it was no new art, as Job had been inoculated by the devil.

Owing to the careless practice of the time, there was some show of right in the opposition. The infected were not kept separate from others; and as inoculation always produced the true disease in its usual infectious form, it became more widely disseminated, and the mortality frightfully increased. In the year 1800, it broke out no less than twenty times in the Channel fleet alone; and the records of the Asylum for the Indigent Blind showed that three-fourths of those relieved lost their sight from small-pox. Its victims in Great Britain amounted to forty-five thousand annually; and the celebrated La Condamine, pleading for the adoption of a remedy in France, said, 'La petite vérole nous décime'—'The small-pox decimates us.' Such were the fatal effects of a disease described by Sir Matthew Hale, even in those who recovered, as 'the very next degree to absolute rottenness, putrefaction, and death itself.'

The world was in this distressing condition when a remedy at once mild, harmless, and effectual, first attracted the attention of Jenner, then a young man pursuing his studies under a practitioner at Sodbury, in Gloucestershire; where the subject of small-pox being mentioned in the presence of a country girl who came for advice, she exclaimed, 'I cannot take that disease, for I have had cow-pox.' 'This incident rivetted the attention of Jenner. It was the first time that the popular notion, which was not at all uncommon in the district, had been brought home to him with force and influence. Most happily, the impression then made was never effaced. Young as he was, and insufficiently acquainted with any of the laws of physiology or pathology, he dwelt with deep interest on the communication which had been casually made to him by a peasant, and partly foresaw the vast consequences involved in so remarkable a phenomenon.'* Possessing much patience and firmness of purpose, Jenner was willing to wait the fruition of his ideas; and contented himself at first with speaking of the prophylactic virtues of the cow-pox among his friends, which he recommended them to investigate. But they treated it as an idle notion; and, as he persisted in bringing it before them, they threatened to expel him from their society, 'if he continued to harass them with so unprofitable a subject.' His firmness of purpose came to his aid; he persevered in his inquiries. It was continually urged, in reply to his assertions, 'The evidence is altogether so inconclusive and unsatisfactory, that we put no value on it, and cannot think that it will lead to anything but uncertainty and disappointment.' His opinions, in many instances, met with abhorrence and contempt, and were treated with general indifference.

Jenner was fortunate in possessing the friendship of the celebrated John Hunter, under whom he had studied in London, and to whom he communicated his views. The reply of the great anatomist supported and stimulated his courage—'Don't think, but *try*; be patient, be accurate.' He knew how to wait. In 1775, his ideas and prospects began to assume a definite form: he foresaw something of the great work before him. To one of his friends, to whom he had explained his theory, he said, 'I have intrusted a most important matter to you, which I firmly believe will prove of essential benefit to the human race.' He vaccinated his own son on three different occasions. Many years, however, elapsed before he had an opportunity of completing his experiments, in the course of which a formidable obstacle was encountered: he found that cow-pox was not, in every case, an effectual preventive of small-pox. This led him to discover the true from the spurious vaccine matter; of which the former alone produces any specific action on the constitution. Though this disappointed, it did not discourage him. He investigated the facts, and arrived at last at the true explanation. He talked of it; wrote of it to his friends; and it was mentioned in London in 1788 by medical professors in their lectures.

In 1798, he published the result of his observations in a quarto of about seventy pages,† in which he gave details of twenty-three cases of successful vaccination on individuals, to whom it was afterwards found impossible to communicate the small-pox either by contagion or inoculation. After weighing every sentence with the greatest care, it was submitted to the judgment of his friends. The work is interspersed with remarks on the identity of the matter in the cow, and in the heels of the horse, when suffering from the disease known as

* In after-life, Jenner was accustomed to relate an anecdote of the days of Charles II. Some one telling the beautiful Duchess of Cleveland that she would soon deplore the loss of her beauty from the effects of the small-pox, then raging in London, she replied there was no ground for fear, as in her own country she had undergone an attack of the cow-pox, which was a preservative.

† An Inquiry into the Causes and Effects of the Variolæ Vaccinæ; a disease discovered in some of the western counties of England, particularly Gloucestershire, and known by the name of the Cow-pox.

'grease;'* and concludes, 'Thus far have I proceeded in an inquiry founded, as it must appear, on the basis of an experiment in which, however, conjecture has been occasionally admitted, in order to present to persons well situated for such discussions objects for a more minute investigation. In the meantime, I shall myself continue to prosecute this inquiry, encouraged by the hope of its becoming essentially beneficial to mankind.'

The publication of this work, so modestly and temperately written, immediately excited the greatest attention. In the same year the author had occasion to visit London, where, during his stay of nearly three months, he could not meet with a single person willing to come forward to test the experiment. Mr Cline, however, afterwards tried the vaccine matter, and proved that, when it had gone through the system, it was impossible to communicate small-pox to the same person. Two ladies, whose names are deserving of record—Lady Ducie, and the Countess of Berkeley—broke through the prejudices of the day, and caused their children to be vaccinated. The countenance and co-operation of the higher classes of London were in great part secured by the instrumentality of Mr Knight, inspector-general of military hospitals: and it appeared that females were most conspicuous in the good work; arising, probably, from their natural anxiety as mothers for the safety of their offspring. Lady Peyton urged the professional men in her neighbourhood to adopt the practice. In the following year the children of the Duke of Clarence, then residing at Bushy, were vaccinated; and a feeling began to spread in favour of the protective remedy.

Jenner watched for the realisation of his hopes. The happiness appeared to be his 'of removing, from among the list of human diseases, one of the most mortal that ever scourged our race.' But the opposition was brewing; and first, after the publication of his 'Inquiry,' came that of Dr Ingenhousz—a name celebrated in medical and scientific history. He was on a visit to Lord Lansdowne at his seat in Wiltshire, when, hearing of a case of small-pox in a man who had previously caught the cow-pox while milking at a dairy, he wrote to Jenner, pointing out the mischief his doctrine would cause, 'should it prove erroneous.' Jenner replied temperately and conclusively; but his opponent, who signed himself 'physician to the emperor and king,' became 'rude, and truly imperious,' in proportion as his arguments were confuted. We are informed that 'he knew no more of the real nature of cow-pox than Master Selwyn did of Greek.' But, said Jenner, writing to a friend, ''Tis no use to shoot straws at an eagle. . . My friends must not desert me now: brick-bats and hostile weapons of every sort are flying thick around me. . . My experiments move on, but I have all to do single-handed.' In a subsequent letter to Ingenhousz, he explains, 'Ere I proceed, let me be permitted to observe that truth in this, and every other physiological inquiry that has occupied my attention, has ever been the first object of my pursuit; and should it appear, in the present instance, that I have been led into error, fond as I may appear of the offspring of my labours, I had rather see it perish at once, than exist and do a public injury.'

Many eminent professional men now appeared to favour his views, while others received them with derision and distrust. Some doubted all the facts and reasons adduced in his 'Inquiry;' a second party denied the merit of bringing forward a fact which had been long known in obscure places in the country; a third affirmed that everything relating to it had yet to be discovered; and a fourth, that the discoverer's opinions were worth nothing—that he had originally obtained the vaccine virus from another practitioner; and, even admitting his reasons, the protective powers of the new remedy would be lost after the lapse of four years. The declared enemies to the practice were less fatal to its success than its pretended friends: the latter had a professional status, which lent authority to their statements, that imposed on the unthinking part of the community. Experiments were made at the Small-Pox Hospital in London, which proved most disastrous to the infant cause; as, from want of care, the true variolous matter, as Jenner expressed it, was 'contaminated' with small-pox, and differed in effect but very slightly from the real disease. This drew upon him the indignation of the metropolitan practitioners; who, however, as it was afterwards established, had been actually disseminating the tainted matter over many parts of England and the continent.

In 1799, Dr Woodville, a physician of London, published a report throwing doubts on the real efficacy of vaccination, which tended to check the high expectations that had been formed of it. Another member of the medical profession, Dr Pearson, lectured on the subject, and issued circulars, offering to distribute the matter to all who applied; thus constituting himself the chief promoter of the new method, to the prejudice of the discoverer, to whom his nephew wrote, 'All your friends agree that *now* is your time to establish your fame and fortune: but if you delay taking a personal active part any longer, the opportunity will be lost for ever.' It had been intimated to Jenner, that if he would settle in London, he might command a practice of L.10,000 per annum. He observes, in his reply, 'Shall I, who, even in the morning of my days, sought the lowly and sequestered paths of life—the valley, and not the mountain—shall I, now my evening is fast approaching, hold myself up as an object for fortune and for fame?'

But the good cause continued to make progress. Its author, in a letter written to the Princess Louisa at Berlin, in December of the same year, states that 5000 persons had then been vaccinated, and afterwards exposed to the contagion of small-pox; but without any ill effect. Lord Egremont took great pains, in a correspondence with Jenner, to clear up the anomaly arising from impure vaccination at Petworth, where he took all the patients, fourteen in number, into his mansion, to prevent the spread of the disease. This nobleman subsequently became one of the most zealous promoters of the new method.

Notwithstanding the violent and unscrupulous opposition manifested in many quarters, the new cause made progress. In this same year attempts were made to form vaccine institutions for gratuitous vaccination, in which Bath took the lead, followed soon after by London. At the head of the latter was Dr Pearson, of whom mention has been already made. He arrogated to himself all the honours and advantages as head of the establishment; and, following his 'rule of doing justice,' as he stated in a letter to Jenner, had reserved for him the honour of 'extra-corresponding physician.' Jenner declined the offered dignity, and wrote to Lord Egremont his objections to the plan proposed by Dr Pearson—the man who had denied and distorted his experiments—and declared firmly against any compromise or contradiction of his own views. Although a fierce war was then raging, the fame of the new remedy found its way to the continent. Drs Odier and Peschin of Geneva wrote and lectured on the subject: and in the two following years 1500 persons were vaccinated in that city. It was known in America before it had been heard of in Paris. Dr Waterhouse of Massachusetts first made the American public acquainted with it, through the medium of the newspapers, as '*Something Curious in the Medical Line.*' The president Jefferson, with his sons-in-law, vaccinated nearly two hundred persons among their own connexions. At the same time it reached our colony of Newfoundland.

Soon after, a vaccine institution was opened in Paris, superintended by committees appointed to obtain precise information, through whose labours the salutary remedy was made known throughout France. The Spanish go-

* It is now known 'that there are at least *four* animals—namely, the horse, the cow, the sheep, and the goat—which are affected with a disorder communicable to man, and capable of securing him from what appears to be a malignant form of the same disease.

vernment, in 1800, took up the question with extraordinary zeal, and fitted out an expedition to convey vaccination to their South American colonies. In 1801, a mission was sent to carry it to Gibraltar and Malta; and in the same year Dr Walker accompanied Sir Ralph Abercromby's forces to Egypt, and vaccinated great numbers of the troops. It was also introduced at Palermo, where, in the preceding year, 8000 persons had died of small-pox; and into our vessels of war by Dr Trotter, physician to the fleet, who said, in one of his letters, 'The Jennerian inoculation will be deservedly recorded as one of the greatest blessings to the navy of Great Britain that was ever extended to it.' It was eagerly welcomed in Germany: and the successful vaccination of Princess Louisa caused its effective introduction into Prussia, the result of which was, the foundation of a Royal Inoculation Institute at Berlin. In Vienna, the use of the new remedy was at first forbidden, having been confounded with small-pox inoculation: the restrictions were, however, soon removed, and some of the most successful experiments performed in that city. At Brunn, in Moravia, a philanthropic nobleman, Count Hugh de Salm, exerted himself, by the distributing of rewards and treatises, to disseminate the practice in that part of the empire. A temple was erected, and dedicated to Jenner, in which his birthday is still annually celebrated.

In 1801, the vaccine was sent from Breslau to Moscow, where the empress-dowager 'zealously promoted the new practice,' and desired that the name of *Vaccinoff* should be given to the first infant—a female—submitted to it. She sent a diamond ring to Jenner, with a letter signed by her own hand, expressive of 'her gratitude to him who rendered this signal service to humanity.' Jenner replied, that the imperial favour was not for him alone; 'it will be felt by the whole world; for sanctions like these will materially tend to extinguish prejudice.' In Denmark and Sweden, so effectual were the measures taken for the propagation of the antidote, that the small-pox was extirpated, and did not return for twenty years; and in Wirtemburg, penalties were exacted from all those who neglected vaccination.

Jenner himself offered one thousand guineas towards fitting out a ship to convey the vaccine to Asia, when it had been delayed by the parsimony of the government. It reached the East Indies in 1801; and the physicians at Bombay corresponded with the discoverer on the subject. The co-operation of the Brahmins, and the favour of the natives, were secured by a trick. A short poem was written in Sanscrit, on old paper, purporting to be of great antiquity, and to have been early known in the country, in which the remedy was recommended; and appealed directly to the religious feelings of the natives, as the 'wonderful preventive' was said to have been originally derived from a cow. It was carried to Africa by way of the Mediterranean; and in 1802, Lord and Lady Elgin, being then on a tour, successfully introduced it into Turkey, Greece, and the Ionian Islands. The matter was sent overland to Bagdad, on lint secured between glass closely sealed, and dipped in melted wax until it became covered by a solid ball, then packed in a box with paper shavings. It arrived safe, and succeeded at the first trial. In other instances, the matter was found to be efficacious after twice crossing the Atlantic, and retained its virtues during a tedious mission through the remotest provinces of the Russian empire to the borders of China.

The progress of the 'extirpator' was such, that in 1802 it was stated, in evidence before a committee of the House of Commons, that 2,000,000 of persons had then been vaccinated, of whom not one had died of the affection. These numbers were, however, but a small proportion of what they might have been, had the practice of vaccination been allowed to have free course—unopposed by ignorance, prejudice, or selfishness. Though there were many to do justice to the immortal discovery, yet a host of others, on very slender grounds, raised a fierce and clamorous opposition. Few even of its friends took the pains to make themselves well acquainted with the principles of the new method. A 'faction' of physicians got up a spirited opposition in the papal states, and reported that vaccination had been forbidden and abandoned in England. The most ridiculous and absurd reports were published. A lady complained that, since her daughter was vaccinated, 'she coughs like a cow, and has grown hairy all over her body;' and in one part of the country the practice was discontinued, because those who 'had been inoculated in that manner bellowed like bulls.' A Mr Gooch of Suffolk had, with his wife, vaccinated 611 patients, of which he observes—'In spite of all ignorant prejudice, and wilful misrepresentations, this wonderful discovery is spreading far and wide in this county. The first people we inoculated in Hadleigh were absolutely pelted, and driven into their houses if they appeared out.'

The same arguments that had been used nearly a century earlier against small-pox inoculation, were directed against vaccination; while, in Switzerland, pastors were recommending it from their pulpits, the most uncompromising hostility was shown in other places. Ehrmann of Frankfort undertook to prove from Scripture, and the writings of the fathers, that 'vaccine was nothing less than Antichrist.' Sermons, abounding in invective, were preached against it. The leading physician of Philadelphia pronounced it to be 'too beastly and indelicate for polished society.' In later years, the celebrated Cobbett also denounced it, in his sledge-hammer style, as 'beastly,' and unfit for adoption.

Dr Rowley, a physician of London, was perhaps more violent in his attacks than any other opponent; and his work is so far useful, as it gives us the sum of the arguments used against vaccination, and shows at the same time to what extreme lengths individuals may be carried by passion and prejudice. The doctor set himself up as the hero of anti-vaccination; for which he formed a society to examine all cases of failures, and of small-pox after vaccination, which he condemned as a 'greasy, horse-heeled project. The sooner cow-pox infatuation is abandoned *in toto*, so much the better for society. . . The world has been viper-broth mad—tar-water mad—magnetism mad—cow-pox mad. . . Cow-pox devastation—all supported by ignorance, knavery, folly, and false faith. . . Those will be considered the greatest enemies to society who longest persist in spreading the criminal and murderous evil. . . Chase from their houses all who propose vaccination . . . Glaring tyranny, to force vaccination on the poor. . . The world did not require cow-pox; the cow-pox was forced into the world. . . Earth trembled! and Heaven profusely shed tears. . . The most excellent physicians are always modest, candid, and unassuming:' whilst vaccinators are 'infatuated visionists,' who pursue an 'irrational and destructive practice. Wild, light-headed adherents, who have distinguished themselves by ignorance.' The doctor appears to have exhausted the vocabulary to find terms for the expression of his abuse, which was not unproductive of evil. It was proved that, although vaccination was performed gratuitously at the Bloomsbury dispensary, yet not a single person applied during several months of the year 1806. An able reply was published by a surgeon named Blair, who turned the doctor's weapons upon himself, in a pamphlet whose title was quoted from one of his learned opponent's fiery paragraphs: it was entitled 'The Vaccination Contest; or Mild Humanity, Reason, Religion, and Truth, against fierce, unfeeling Ferocity, overbearing Insolence, mortified Pride, and Desperation.'

The attacks on the invaluable discovery were, at the same time, vigorously carried on in other quarters. We should be at a loss to understand the motives of so much hostility, did we not see something of the kind in our own day, in the sneers occasionally bestowed on novel matters of science. The cause, however, triumphed. Ribaldry, scorn, and abuse, have dwindled down to a mere echo, and are scarcely or

never heard. The glory of a great man is ever attended by envy. The nations of antiquity would have raised altars to Jenner's memory, or stamped his effigy on their coins—as was the case in some of the states of Greece, and was done by the citizens of Cos in honour of their countryman Hippocrates. Cuvier said, 'If vaccine were the only discovery of the epoch, it would serve to render it illustrious for ever.'

Part of Jenner's reward was in the letters he received from all quarters of the world, filled with expressions of grateful reverence, and anticipations of the benefits of his discovery. His case was brought before parliament, and, not without opposition, the sum of L.30,000 was voted to him in two grants. It was proved that, had he kept vaccination a secret, he might have made L.20,000 a-year; but he worked not for himself. The chancellor of the exchequer said of it, during the debate, that it was 'the greatest, or one of the most important, discoveries to human society that was made since the creation of man.'

But far greater the reward, in the consciousness that he had saved to the world millions of lives, and secured humanity from its deadliest destroyer. It is not what we undertake, but what we accomplish and confirm, that constitutes glory. Jenner died with the title of benefactor to his kind. In the words of his friend Dr Lettsom, 'His claim is that of having multiplied the human race, and happily invoked the goddess of health to arrest the arm that scatters pestilence and death over the creation.' His is one of those English names with which intelligent foreigners are, as might be expected, most familiar. Often have such persons, taken to Westminster Abbey, and told that it is devoted to the names of our great men, asked for the monument of Jenner. Strange to say, while much military prowess, now of little account, is there recorded, this truly great and memorable man is without his stone, and likely long to remain so.

THE THREE FRIENDS.

[From a volume of little heart-warm pieces, breathing the new feelings of our time, by our friend Camilla Toulmin. Orr and Company, London. 1846.]

THERE were three friends—that is to say,
They were men meeting every day;
Grasping each other's hands with earnest pressure
Upon the mart, or in the hours of leisure.

The eldest had a large and finely-tempered heart,
Thought a few thoughts in which the world had not a part,
And as the mountains are the first to win
A dawning glory ere the day begin,
He saw to trace his life-chart on a plan
Of simple grandeur meet for such a man.

His acts oft puzzled worldlings, who, you know,
Bat-like, are blinded by the noonday glow
Of deeds to which they cannot find the clue
Of double motive or a selfish view.
And yet as mountain sun-crowns downwards creep,
Till o'er the plain the generous day-beams sweep,
So from the height of his great soul were caught
Some peerless lessons by example taught.

'But,' says the reader, 'to these three great friends,
I cannot see which way your story tends.'
Patience; and yet, perchance, when all is told,
Meaning or moral you may not behold!
Of station, fortune, equal all had been,
But to the younger two came losses unforeseen.
Generous and prompt, the first with open hand
Made free his fortune to their joint command;
Saying, 'It is a gift or loan, it matters not,
According to the chances of your future lot.'
A test of friendship bravely, nobly borne;
But though the theme be much less trite and worn,
It is almost as hard—I own not quite—
To take with grace, as to bestow aright,
Favours like this; which try mind-metal more
Than shielding life with life amid the battle's roar.

One was profuse of thanks; yet you might see
He bit his lip half-peevishly,
And to his cheeks the chafed and feverish blood
Sent fitfully its tell-tale flood.

The other said, 'God bless thee!' fervently;
'God knows, I would have done the same for thee.'
And several signs stood out in strong relief
To mark the twain; but, to be brief,
The one a slave, in struggling to escape,
Broke up his household gods of every shape,
To melt them—in his heart—into one figure rude
Of monstrous mien, which he called Gratitude:
Until, self-tortured by his hideous guest,
Day brought no peace, and night no rest!
The other one walked upright as when he
First knew his friend in all equality.
There was no servile crouching; no revoke
Of differing thoughts he once had freely spoke
(For e'en as discords harmony may make,
So kindred minds some different views may take).
The only chain the gold 'twixt them had wrought,
Drew them more near, and dearer friendship brought.
'God knows, I would have done the same for thee!'
'*I* know he would have done as much for me!'
Was felt—not said—by each respectively.
An unsung music to themselves most dear,
As one may silent read a page, not hear.

The writhing slave knew nought of such sweet peace;
His visits shorten, and at last they cease.
As for the lender, if his thoughts be told,
He mourns to lose a friend, and not his gold.
Unto the other once he said, 'Your words are true.
You've tested me; but I have tested you!
It pains my heart to know *he* could not comprehend
The rights and pleasures of a faithful friend.'

'It chances,' said the third, 'that you and I
Do understand each other perfectly.
But frankly tell me, do not you opine
That, out of every hundred, ninety-nine
Of poor mankind do not know how
Either t' accept a favour, or a boon bestow?
No matter what on Friendship's shrine the oblation,
They shrink in horror from an obligation!
So little are the ties of brotherhood
Between earth's children understood;
So few who seem such thoughts to understand,
That I could count, upon the fingers of one hand,
With whom I know such bonds might be,
And give or take all equally,
Without disturbance of our self-respect,
Or some regret the curious might detect.'

'"Tis very sad!' the first one sighing cried;
'God's gifts we most unequally divide.
How shall we teach one human brotherhood?'

'Trust God! and trust the might of doing good!'
The other answered. 'There's a dawn draws near
(May eyes grow stronger ere the noon appear,
For some I know that not e'en now can bear
Truth's struggling beams that pierce this murky air!)
Why, 'tis a wholesome sign, you will aver,
That even you and I can thus confer!'

RISE OF THE MULGRAVE FAMILY.

The first diving-bell we read of was nothing but a very large kettle, suspended by ropes, with the mouth downwards, and planks to sit on, fixed in the middle of its concavity. Two Greeks at Toledo, in 1588, made an experiment with it before the Emperor Charles V. They descended in it, with a lighted candle, to a considerable depth. In 1683, William Phipps, the son of a blacksmith, formed a project for unloading a rich Spanish ship sunk on the coast of Hispaniola. Charles II. gave him a vessel with everything necessary for his undertaking; but being unsuccessful, he returned in great poverty. He then endeavoured to procure another vessel; but failing, he got a subscription, to which the Duke of Albemarle contributed. In 1687, Phipps set sail in a ship of 200 tons, having previously engaged to divide the profits according to the twenty shares of which the subscription consisted. At first, all his labours proved fruitless; but at last, when he seemed almost to despair, he was fortunate enough to bring up so much treasure, that he returned to England with the value of L.200,000. Of this sum he got about L.20,000, and the Duke of Albemarle L.90,000. Phipps was knighted by the king, and laid the foundation of the fortunes of the present noble house of Mulgrave. Since that time, diving-bells have been very often employed.—*Mechanics' Magazine*, No. 1119.

FOUR-AND-TWENTY HOURS AT SMYRNA.*

It must be almost impossible for those who have never had an opportunity of visiting eastern countries, or experiencing a greater degree of summer heat than our own temperate climate can produce, to form any idea of the marvellous brilliancy of those striking landscapes when the noonday sun is pouring down his full splendour upon them. It is but seldom, indeed, that persons habitually resident in those regions ever witness such a sight. There are few admirers of nature sufficiently enthusiastic to brave a *coup de soleil*, or a brain fever, one or other of which fatal consequences are too often the result of incautious exposure. Yet although it was on one of the most sultry days in the month of May that we landed at Smyrna, I think any one would have risked a good deal to have witnessed the scene which gradually opened upon us as we approached that interesting spot. Sky, earth, and sea, all were bathed in one flood of light; and the full blaze of an unclouded sun at once illuminated and embellished the beautiful Asiatic shore and the picturesque city which lay before us. Only one dark spot, which even that flaming orb could not brighten, gave effect to the landscape; and this was the grove of sombre cypress-trees which, spreading over the side of the hill almost to the sea-shore, marked out the Moslem cemetery. There are few, if any, of the eastern cities more deeply interesting than Smyrna; the very name must at once suggest its principal claim for a more than ordinary share of attention; and in fact it is only in reference to it, as one of the seven churches of Asia, that the more prominent features of its present condition become so remarkable. From its central position, as well as from its commercial influence, it is the resort of persons of every country and denomination, besides being the resting-place of travellers to many different quarters; and, in consequence of this, I believe there is no place where so many different religions are not only tolerated, but firmly established and flourishing, in perfect harmony with each other. Mohammedanism is of course the religion of the country, but its various sects are here more than usually distinct. Judaism greatly prevails—the Hebrew population being numerous, and the members of the Armenian church scarcely less so. Then there is the Gueber, or fire-worshipper, whose adoration of the sun is at least less astonishing here than it would be in England: the Greek; the Roman Catholic; the Nestorian; and many others, which I have neither time nor space to enumerate; besides a considerable number of Protestants from all parts of the globe. There are several European families which have become naturalised at Smyrna; and notwithstanding the lapse of a generation or so, they cling with the greatest tenacity to the manners and customs of their countries, and in many instances have preserved the purity of their faith, both in doctrine and ritual, far more perfectly than it now exists in the lands whence they brought it. Besides all this, Smyrna is, as it were, the focus of the numerous branches of missionary societies in the East, and it is consequently inhabited by a vast number of Americans. It was my favourite plan, that we should endeavour to visit all the places of worship to which we could gain access in the city; but we were on our way to the Black Sea, and the steamer only remained four-and-twenty hours at Smyrna, which was undoubtedly too short a stay for so interesting a place, and rendered my project scarcely feasible.

We had scarcely anchored, when the fact that we had passed, within the last twelve hours, from one quarter of the globe to another, was brought with full conviction on our minds by the arrival of sundry most Asiatic-looking figures, whose manners and appearance afforded a striking contrast to the Greeks of the classical island of Scio, which was the last place we had touched at. Although nothing could be more picturesque than these fine-looking, majestic men, with their black eyes, long beards, and dark olive complexions, they were merely 'valets de place' come to offer their services; and it seemed very strange to hear them, in their flowing garments and heavy turbans, talking French, English, and Italian with the greatest ease. The process of going on shore appeared to us one of considerable difficulty; for the only means of transporting ourselves and our luggage was in boats, so extremely small and narrow, that we fancied the weight of one person would be sufficient to capsize them; but as there was no alternative, we consented to embark in a slender little caïque, which, though it danced on the waves as if it had been made of India-rubber, certainly brought us safely to land. We had so many friends and near connexions in Smyrna, that we scarcely felt ourselves in a strange country, as we walked, accompanied by them, to the house of Madame W——, whose kind hospitality was to save us from the miseries of a night in a *soi-disant* European hotel. The streets, as in all eastern towns, were dirty, dark, and narrow; but we were too much delighted with the endless variety of costume, to think either of the rough stones, or of the heat of the sun, from which we were only partially protected by the projecting balconies and canopied stalls. We passed along the whole length of the 'Street of Roses,' scarcely finding time to ask to what nation each fantastic figure belonged. There was the Armenian, with his narrow, straight robe, and his black head-

* We are indebted for this paper to the same lady who lately graced our pages with descriptions of the Slave Market of Constantinople and the Harem of Eiredeen Pacha.

dress, which I can only describe as an enormous square cushion; the dervish, with his blue mantle and high conical cap; the Cossack, with a perfect mountain of fur on his head; and numbers of women, with their white or black veils and huge brown cloaks.

The house of Madame W——, to which we were going, was in the Quartier Franc, and, like most other good houses in that part of the town, was surrounded by a large court filled with trees, the entrance to which was by a stone passage, so long and wide, that we fancied ourselves still in the street, until the ponderous gate was closed behind us. We were not sorry to remain quietly under shelter for several hours, till the heat had abated; but as soon as the streets were somewhat in shade, we set out to walk to the Bridge of the Caravans, which is the fashionable evening promenade in Smyrna. To reach this spot, we had to traverse almost the whole town, in fact but a continuance of ill-paved streets. It is the custom of the Smyrniote ladies (rather a singular one, according to our ideas) to pass the evening in the open air, at the doors of their houses. Amongst the higher classes, they even have their vestibules arranged for this purpose, with ottomans, cushions at no allowance, and tables loaded with sweetmeats and all sorts of 'fricandises;' and really they looked so charming, as they reclined in graceful attitudes, laughing and talking together, in their little red and gold caps, short velvet jackets, and silk petticoats, that we were quite disposed to approve of a practice which thus enabled us to judge of the far-famed beauty of the Smyrniote women; and I must own that, except in the island of Naxos, which I think unrivalled on this score, I have never seen a greater collection of lovely faces. We could not, however, pay them all the attention they deserved, from the very evident necessity of taking care of ourselves in the narrow streets; for the Turks treated us with indifference; and I think they would really have walked over us quite coolly, rather than give themselves the trouble of making way. We had especially to keep clear of all the magnificent Osmans and Mustaphas who came jogging towards us, mounted on little miserable donkeys, and looking most pompously ridiculous with their solemn faces and ponderous turbans, whose weight alone would have seemed sufficient to have overpowered the wretched animals they rode on. The change was delightful when we emerged from the stifling atmosphere of the town into the lanes which led through green vineyards, and beneath the pleasant shade of mulberry-trees to the bridge; nor did we find the walk too long, though the distance is considerable from the Quartier Franc.

This much-vaunted bridge derives its name from the number of caravans that hourly pass over it on their way to the interior of the country, and is remarkable only from the extreme beauty of its position. It is high, long, and narrow, stretching over a clear and rapid stream, and surrounded on all sides by magnificent old trees. At a short distance rises a green and vine-clad hill, whose summit is crowned by a ruined castle, which, though picturesque, is of no great antiquity or interest. On the one side of the river—the refreshing murmur of whose waters has, in this sultry land, a charm we never could imagine elsewhere—numberless little establishments have been erected, where coffee, pipes, ices, &c. are provided for the promenaders, and chairs are placed under the trees, that they may sit luxuriously in the shade, and partake of these refreshments; and here does the whole fashionable world of Smyrna congregate every evening, to walk and talk, to see and be seen. On the other side of this narrow stream, but a few yards distant, silent, desolate, and shrouded in impenetrable darkness, lies a vast Turkish burial-ground, extending much farther than the eye can reach, and possessing, in the highest degree, the picturesque beauty for which those cemeteries have always been celebrated. It was impossible for the most unimaginative mind not to be struck with this singular sight: that little sparkling river, dancing on its way with, on the one hand, life busy, gay, and frivolous; and, on the other, death in its most solemn gloom and stillness! We determined to visit both; but we chose first to inspect the portion devoted to the living; and certainly it presented life under a novel aspect. Everything that retained the true 'souleur locale' was delightful, especially the portly Mussulmans, seated in a circle on their rich carpets, smoking gravely, and emitting a short sentence once in half an hour. But amidst the crowds from every nation that surrounded us, there were not a few who laid claim to being thoroughly Europeanised; having, in their own opinion, arrived at this happy consummation by caricaturing outrageously the Parisian fashions of the last season—just as they are apt to do in provincial towns at home; though nowhere could the glaring mixture of colours, and the indescribable hats and feathers, have looked so absurd as when contrasted with the native costume, and surrounded by that truly Oriental scenery. We were watching a group of Turks who were supping together—each one partaking in turn of a greasy ball of rice, which was administered to him by the head of the party, whose green turban distinguished him as a descendant of the prophet—when an exclamation from one of our companions attracted our attention to a caravan that was crossing the bridge. The procession was headed by a little, sober-looking donkey, unburdened, and without saddle or bridle, which led the way with great sagacity; and notwithstanding his humble appearance, we were assured that, without his assistance, the drivers would have found it impossible to have induced the camels to proceed. Next came a long and almost interminable line of those huge animals, walking in single file with that slow undulating movement which is so peculiar to their species: they were heavily loaded, and each one was mounted by his master, who guided him merely by the voice. The long train, with its gay eastern dresses, had an admirable effect as it wound under the trees and across the bridge: it was altogether in perfect keeping with the landscape. We watched them till the last camel, of which there were some fifteen or twenty, had disappeared, and then we also crossed the bridge, in order to explore the cemetery.

The distance was but short which separated the haunts of the living from the dwelling of the dead; yet scarcely had we penetrated a few steps into those thick shades, when we found ourselves shut out completely from all sight or sound that told of human life, and in the very midst of that most awful of all desolation—a solitude peopled with the ashes of those who were and are not! Around us, on every side, dark and silent, rose an interminable forest of gigantic cypress-trees, so closely grouped, that even the light of day could scarcely penetrate amongst them, and spreading on and on in unbroken gloom, till the eye became bewildered in attempting to limit their empire; and beneath, yet more interminable, yet more sad and silent, lay the forest of tombs, each cold white stone strangely distinct in the surrounding darkness, and yet so innumerable, so thickly strewn upon the earth, that a chill struck on the heart at the thought of how immense was this population of the dead. There was not a sound: for the summer breeze, passing through the unbending branches of the cypresses, drew no murmur from those mournful trees, and the slanting rays of the setting sun, as they shot at intervals across the graves, made the turbaned monuments look, in the faint glimmering light, like the pale phantoms of the departed, each one watching over his own slumbering ashes. We sat down among the tombs to wait the termination of sunset,

whose influence we felt in the deepening shadows round us; though it was rarely that we caught a glimpse of that fading glory, or of the softer light of the rising moon, whose silver crescent, appearing among the trees, amply compensated for the entire absence of twilight. Monsieur V—— read to us the inscription on one of the graves near us, whose highly-gilt monument and painted turban seemed to indicate that the dust it contained had once been honoured of men. It stated that this son of the faithful had, throughout a long life, so perseveringly performed all the outward acts of devotion in which the religion of the Moslem consists, that he was most assuredly wandering even now with the dark-eyed houris by the shores of that lake where lie the sparkling bowls filled with the water of immortality. To me, in that vast abode of the dead, which in its deep stillness seemed so far removed from the hopes and fears of human life, it was quite painful to be recalled by this pompous panegyric to the gross and lowering ideas with which the Mohammedans have clothed even the heaven of their dreams; for their creed does not allow the soul to disengage itself from the trammels of the flesh, even in their hope of an immortality beyond the grave. It is a very characteristic trait of this people, the care with which a little basin is scooped out on the stone of every grave, to catch the rain-water, that the birds may come and drink; thus carrying out their principle of universal charity even after death. We left the cemetery as soon as it was dark, passing once more through the merry groups who were proceeding homewards, each one carrying his little paper lantern to light his steps as he went along.

Before six o'clock the next morning we were all astir, anxious to accomplish what we could in the short time allotted to us. We proceeded first to the bazaars, in search of some of the beautiful Smyrniote embroidery, which is nowhere else to be found. These bazaars are as spacious as they are interminable, and their shops displayed the produce of every part of the globe. We entered into several of them, finding each furnished with its Persian carpets, and comfortable cushions placed round the wall, where we were invited to sit and drink coffee as long as we chose. But the most interesting sight, where everything was new and picturesque, were the traders who had come from the interior of the country, and who, with their singular dresses, wild gestures, and strange dialect, attracted much of our attention as they stood in groups round the seats of the money-changers, or at the stall of the public weigher—his balance and weights being in constant requisition for the grains and spices which formed the principal part of their merchandise.

I was very anxious to gain admittance into a mosque, which is as difficult in Smyrna as it is easy in Constantinople; and accordingly proceeded to one of the largest, in hopes of being able to effect an entrance with the help of Monsieur V——. Numbers of Turks were collected on the wide steps which lead to the three principal doors, and round the fountains, where they performed their ablutions before daring to enter within the sacred precincts. As soon as we had passed the railing which enclosed the outer court, they hurried towards us, with the evident intention of opposing our further progress. Monsieur V—— addressed them in Turkish; and for some time his utmost eloquence was only met by the most angry refusals; at last, however, they consented, with very surly looks, to admit us, provided we would take off our shoes; nor would they even allow us to substitute slippers, as is the custom at Constantinople. None of the party were disposed to undergo the penance of walking in this manner up the stone stairs excepting myself; and I therefore entered alone, but not until each of the Turks had separately knelt down to ascertain that I really had, in all sincerity, complied with their request. The mosque was extremely large, divided into three compartments, the centre of which was the most sacred, and separated from the others by a few low steps. At the east end, much in the same position as the altar in Christian churches, was a representation of the tomb of the prophet, and near to it was a sort of pulpit, from which a portion of the Koran was read every day. From the vast dome-shaped roof hung a long rope, supporting innumerable little glass lamps, and various strange-looking ornaments—such as ostriches' eggs, horses' tails, &c.; and in the centre were inscribed the seven names of God in Turkish, Persian, and Arabic, forming a large circle of gilt letters. The floor was entirely covered with those beautiful little carpets of which even one is considered a treasure elsewhere. A few early worshippers were scattered here and there, bowed towards Mecca, with their foreheads touching the ground; and, difficult as it is to attract the attention of a Turk when engaged in his devotions, my entrance roused them all. They stared at me for a moment in utter amazement, and then simultaneously starting from their knees, crowded round me, vociferating and even throwing themselves on the ground, to ascertain if I had not already desecrated their sanctuary by walking as though on common ground. The mullah, through whose influence I had been admitted, came to my assistance, and showed them that I had left my shoes outside, upon which they returned to their places, though with looks of great discontent. I was standing near the principal door, which was wide open, and so large, as to afford a view of the interior of the mosque from the street; at that moment a Frenchman, who was on board of the same steamer with ourselves, happening to pass by, saw me there, and imagined that any one might enter at will. He therefore came up the stairs, and had advanced to the door, when he was observed by a man, apparently belonging to the mosque, who was sweeping the carpets. I suppose he was already exasperated at my presence; but he had scarcely perceived this new intruder, than he uttered a howl of rage, and seizing a pole which stood near, he ran at him with it in the most ferocious manner. The attack was so sudden and so determined, that the poor Frenchman had no time to collect his ideas; he ejaculated one faint 'Miséricorde!' then tumbled head-foremost down the stairs, and disappeared in a whirlwind of dust. I soon after made my exit also, but in a quieter manner, and we then turned our steps in the direction of the Jewish synagogue, which, to my great delight, Monsieur V—— had promised I should visit, as he was well acquainted with one of the rabbins.

The synagogue is in a crowded part of the town, and so hemmed in by houses, that it is not easy to distinguish its outward form; and the more so, as it is surrounded by a high wall. We were admitted at a side door, where we waited a few minutes till Monsieur V—— returned with the Rabbi Michaël. I do not think I ever saw a more pleasant-looking person. He wore a high black cap, with a loose robe and inner garment of striped silk; his hair, unlike the generality of Jews, was quite fair, and combed back from a broad open forehead; and his long beard did not at all detract from his youthful appearance. His manner was full of quiet dignity, though perfectly unassuming, and his voice was peculiarly sweet and low-toned. He conducted us up the stairs, and, unlocking the door, admitted us into the synagogue. with which, to say the truth, I was much disappointed, though it was totally unlike any other place of worship I had ever seen. It was a large square room, lighted by narrow windows, and surrounded by seats made of plain new wood; for it had only been recently built, the former building having been destroyed in a late conflagration. In the centre was a small platform, raised a few steps, and enclosed by a high close railing, hung with thick curtains of crimson silk. These the rabbin drew back, and we saw a small table, with a covering also of silk, embroidered with gold, on which were laid the books of the Pentateuch, and various parchments inscribed with Hebrew characters. At the upper end of the room an ample curtain concealed some object, apparently too sacred to be exposed to view; and the rabbin looked so uneasy when we

approached it, that we could not venture even to inquire what it was. He showed us the garments of the high priest, which were kept in a large iron chest, and which were both magnificent and curious. There was the linen ephod, the embroidered robe, the breast-plate, and the girdle—the two latter were engraved with the sacred words. We had not time to examine many minor details in the arrangement of the synagogue, but it was altogether less interesting than I expected. The rabbin invited us most earnestly to go and rest a few minutes in his abode; and Monsieur V—— persuaded us to agree to his request, as he said his house was one of the most beautiful in Smyrna, and well worth seeing. We had merely to cross the street to reach the door, and, after ascending a wide stone staircase, we entered into a large hall paved with marble, and abundantly furnished with ottomans and carpets. The upper end of the room was entirely occupied by three immense windows cut down to the ground, and opening on a flight of white marble steps, which led down into one of the loveliest little gardens imaginable: the light was almost obscured by the clustering vines and thick rose-bushes; and the fragrance of these and other plants, the cool shade which they produced, and, above all, the refreshing murmur of the fountains, certainly rendered this a most charming abode. The rabbin's wife, who came in with refreshments, was a most suitable inhabitant for such a dwelling, for she was really a beautiful woman, with all the distinguishing features of the Jewish race. Though less dignified than her husband, she seemed gentle and amiable, and her dress was particularly becoming—the bright green handkerchief which bound her forehead showing off to great advantage her clear black eyes and dark complexion. We remained with them for some time, and after seeing the interior of this family, we no longer wondered at the high respect in which the Jews are held in Smyrna. We left them at last, to pay a visit which, for me at least, had no small attractions.

I had received a letter written in Arabic, of which I was anxious to procure a translation, and Monsieur V—— found, after many inquiries, that there was but a single person in Smyrna to whom I could apply for one with any chance of success. This was a venerable dervish, famed for his sanctity and learning, who was universally resorted to for advice, and whose wisdom and knowledge were supposed never to be at fault. There is a very attractive degree of mystery connected with the sect of dervishes: their origin, and the exact nature of their peculiar tenets, are not, as far as I could learn, precisely known; but they are everywhere held in high estimation. The dancing and howling dervishes live together in monasteries, which are in many points similar to those in Roman Catholic countries; but the sage we were going to visit did not belong to either of those orders, and therefore lived quite alone. Monsieur V—— thought it highly improbable that he would consent to receive the visit of a lady—an event which certainly never could have occurred in his life before; but as my anxiety was principally to obtain a translation of my letter, I was quite willing to wait till this should be accomplished. We soon reached the place, a small solitary house on the outskirts of the town, and my companion went up the narrow stair, and disappeared, leaving me, too happy to escape from the burning sun, under the cool matting that sheltered the terrace. In a few minutes he came back, laughing heartily, and told me that the old dervish was in the highest state of excitement at the idea of being visited by a European lady, and that he would willingly translate my letter, if I would only come in and let him see me. Two negro slaves held up the curtain which hung before the door, and I entered the 'sanctum' of the wise man. It was a room of moderate size, with a large recess at one end, three sides of which were of glass. Several steps, covered with a splendid Persian carpet, raised this part of the room above the rest, and it was almost filled by a high divan, on which the dervish was seated in great state. He wore the conical cap and flowing robes of his sect; and really his long beard, streaming down to his waist, and his solemn countenance, impressed me with a very sufficient idea of his vast wisdom. A large box stood beside him, filled with curious old parchments; and the divan, as well as the platform beneath, was strewed with books of all kinds. In the lower part of the room there were a number of astronomical instruments, and various extraordinary-looking machines, of which I could not even divine the use. The only other inhabitant of the room was a younger dervish, who, though seated on the same ottoman, evidently felt much awed in the presence of his superior, and sat stroking his beard in silence. The sage decidedly thought it beneath his dignity to exhibit any astonishment at my appearance, and he returned my salutations in a most majestic manner; though I was much amused at the sly glance he fixed on me when he thought I did not observe him. A chair was placed for me in the outer part of the room, as he could not allow the infidel to approach nearer to him, or even to ascend the steps which led to his seat. After the usual complimentary speeches, coffee was brought, which I was forced to swallow, much against my will, as it was without sugar, and excessively thick. He then took out his writing materials, which he wore, according to the eastern custom, in his belt, and received my letter from the younger dervish, to whom it had been transmitted by Monsieur V——, with all due formality. He read it, then solemnly bowed to me, as an indication that he understood it; he next proceeded to take a small sheet of paper, which he laid on the palm of his hand, and began to write, using a pen made of a reed. It seemed to me impossible to form a single letter in this position; but in the course of a few minutes he presented me with a translation of the manuscript in Persian, Syriac, and Turkish, and the writing of each separate character was a perfect model. This was all I required, as it was easy to obtain a translation from the Turkish. But the good dervish seemed to think I ought now to make myself agreeable to him, and he commenced a conversation through the medium of Monsieur V——, who acted as interpreter. First he asked me questions innumerable about myself, my family, and my whole history past and present. Having then ascertained that I belonged to that very distant and barbarous island of Great Britain, he composedly begged that I would give him a distinct account of the government, laws, religion, and institutions of that country, with which, he assured me, he was wholly unacquainted. My companion laughed outright at my look of despair at this exorbitant demand; and as we could distinguish from the windows the steamer which was to carry me away with its chimney already smoking, he pointed it out to the dervish as a reason for terminating our visit immediately. He seemed very reluctant to let me go; but I at last rose, and having made him a flowery speech, which he heard most graciously, I prepared to go out. He then turned with considerable energy to Monsieur V——, and asked him to bid me stop one moment. I complied, and extending one hand towards me, while he raised the other to heaven, he uttered, in the most impressive manner, what seemed to me to be a short prayer, as it commenced with the words, 'Allah il Allah!' The younger dervish and Monsieur V—— listened to it with the greatest reverence; and when he had concluded, my friend translated it word for word to me. It was a blessing, solemn and fervent, which he had called down upon me; beginning with saying that, infidel as I was, he prayed of Allah to hear him in my behalf, and, with the beautifully figurative language of the East, asking that my voyage through life to the eternal shore might be brightened with sunshine as gay as that which now smiled on my journey to my native land; and, above all, that the most secret wish of my soul might be gratified. The solemn manner in which this prayer was uttered by the good old man

made no small impression on me, and I was not sorry to carry such a blessing away with me, when, a few hours after, we left Smyrna with a calm sea and a fair wind on our way to the Dardanelles.

MIRANDA HURTADO, OR THE DISCOVERY OF PARAGUAY.*

BY PERCY B. ST JOHN.

On the first day of January 1516, Juan de Solis sailed up a river which he called January River, now Rio Janeiro; thence he journeyed south many miles, and discovered the mouth of the Rio de La Plata, on whose shores he was killed, and barbarously devoured. Unalarmed by his tragic fate, Sebastian Cabot, in 1526, with several ships, continued the discovery of the country; and, after journeying up and down the waters of that vast land, which extends from Brazil to Peru, erected in the interior a fort, on the river Zacaranna, or Terceiro, which was known as Cabot's Tower. After some time, this famous admiral, who had previously discovered Newfoundland for the English, departed for Spain in search of succour, leaving Nunez de Lara, with a hundred and twenty-six men, in command of the fort, known both by the name we have just given, and as Spirituo Santo Fort.

Nunez de Lara no sooner found himself alone with his men in the centre of a wild and unknown country, than he began to take such precautionary measures as he thought necessary for his protection. The situation of the fort was admirably adapted for defence against the aborigines, who had as yet no other arms than those which their own ingenuity had enabled them to devise, and which were amply sufficient both for defence and aggression amongst the various nations which occasionally met in arms one against the other on the plains of the Parana and Paraguay. Their numbers, however, were great, which made the hill on which the tower was built of no small value, while the stockade which surrounded all the various buildings was no less welcome. At the foot of the slope was a small plain, stretching out for a mile before it mingled with the forest, while between the fort and the river, which the Indians called Zacaranna, and the Spaniards Terceiro, lay a marshy expanse, thickly overgrown with canebrake and brush. Thus fortified, and surrounded by brave men, to say nothing of a small battery of cannon, Nunez de Lara might readily have been excused had he considered himself impregnable; but the valiant and yet careful old Spanish soldier was not yet satisfied. Amongst his people were five European women, and several children; one of the former being Lucia Miranda, the young and beautiful wife of Sebastian Hurtado, his lieutenant, and devoted friend and adherent. This lovely Andalusian had left her native town, where she was the reigning belle, and the just pride of her family, to follow the uncertain fortunes of her husband, who, smitten as many others were with the love of discovery, and the hope of falling in with mines of silver and gold—which Paraguay and its neighbourhood was mistakingly said to abound in—had embarked his whole wealth in the adventure of Sebastian Cabot. Thus was the new world peopled, posterity reaping the benefit, which was in general denied the pioneers of civilisation, simply because they expected too much, and threw away the solid advantages which lay at their feet, to follow chimeras, the fault of many in less remote times.

When Nunez de Lara gazed upon the beautiful and happy Miranda—happy in the affection of a noble and gallant husband—his heart misgave him often that the trust which had been imposed upon him was by far too serious, and that greater precautions than had already suggested themselves to him were necessary. After some thought, he came to the decision of making a friendly alliance with a great and powerful cacique in the neighbourhood. Accordingly an embassy was sent, with much pomp and many presents, to Mangora, the chief alluded to, who governed the vast and numerous tribe of the Timbuez. Mangora, flattered by the liberal donations sent him, and the attention paid him by the Spanish governor, reciprocated his good wishes, and promised all that could be desired. Ruiz Moschera, who conducted this diplomatic mission with so much credit to himself and advantage to the station, returned, after four days' absence, with the above gratifying intelligence; to which he added, that Mangora would the next day himself pay his return visit to the excellent General Nunez de Lara. The worthy old soldier, delighted at the success of his enterprise, determined to receive the Paraguayan king with becoming solemnity and majesty. The cannon were loaded; and, early on the auspicious morning, the whole garrison assembled under arms, dressed in the very last style which, at their departure, had been in vogue in Spain. It is true the cloth was somewhat faded, and the worse for wear, while many imperfections were, to Lara's great grief, visible in the other appointments of his soldiery; but to a savage, uninformed eye, the aspect of things was magnificent, and Lara could sufficiently read this in the cacique's wondering gaze. Nor had the Timbuez been at all wanting in adornment. Many a streak of paint had been added to their ordinary embellishments; while their heads, plucked of hair, except where the centre tuft stood erect, their bodies pricked by flints, their varied colours, their ornaments of shells tinkling round their belts, their ears and lips adorned with stones, their eyebrows eradicated—all gave them a warlike, though not very amiable appearance. A grand banquet had been prepared in the principal apartment of the fort, at one end of which presided Lara, at the other Miranda. Despite the novelty of all they saw, not a sound escaped the Indians until they discovered the beautiful Andalusian, and then a universal exclamation brought the rich blood mantling to the cheek of the wife of Hurtado. The Timbuez had never beheld anything equal to this lovely apparition; for Lucia had added to her native charms all those which her sex know so well how to draw from a careful and exquisite toilet.

The banquet proceeded, while on both sides the Spaniards and Timbuez vied with each other in mutual acts of courtesy. The Indians, accustomed to their own simple food and utensils, were surprised even at the scanty show which was made by these hardy exiles; while the various arms exhibited by them excited their wonder and envy, their own being simply the bow and arrow, and a fish-bone dagger, called macana. At length, however, the feast concluded, when Mangora dismissed his warriors, and signified his intention of passing a few days with his new friends. Lara, delighted at the confidence exhibited by the Timbuez chieftain, had him conducted to a chamber, where he passed the night, his followers returning to their camp in the fastnesses of the Tucuman hills. The next day Nunez devoted to a foraging expedition, on which duty he took the greater portion of his troops, leaving Mangora to the charge of a dozen men and the fair ladies of the garrison. To this arrangement the Indian appeared nothing loath, showing in every possible way his increasing admiration for the grace and beauty of Miranda. At length, after the last evening meal, when the tenants of the fort were all engaged in watching for the return of the foragers, Mangora found himself alone with the wife of Hurtado. His usually calm aspect changed at once; and rising from a couch of skins which had been provided for him, he approached Miranda, and in the few broken words of Spanish, which had rapidly spread amongst the natives, aided by signs, declared his true reason for remaining behind to be love for her. The wily chief painted in glowing colours his lofty position, and intimated his desire to make Lucia his queen.

* The following narrative is true in every detail, if we are to credit the histories of Paraguay. The Hurtados are still well known in Buenos Ayres as merchants, and relate to the traveller with pride this record of their ancestors.

The alarmed wife, who saw how earnest was the passion of this untutored savage, and how dreadful might be its consequences to her and all she loved, strove to laugh off his protestations; and at length, finding his brow darkening and his black eye kindling under the influence of disappointment, boldly resolved to smother the Timbuez's hopes, by stating how dearly she cherished her husband, and how hateful were the propositions of the Indian. Mangora, who understood not the influence of a tie, which is one of the greatest boasts of civilisation, and which outweighs all the fancied advantages of savage life, chiefly chimerical and visionary,* remained alone. His features were inflamed by rage and fury; which feelings, however, gradually gave way to those of satisfaction, as he dwelt intently upon hopes which he had evidently not stifled. By the time Sebastian Hurtado returned with Lara, he had entirely eradicated from his countenance all trace of anger, and it was with a clear and open brow that he invited the husband to pay him a visit, with his wife, in his village on the slope of the Tucuman. Sebastian could not refuse an offer made so gracefully, and it was at once accepted; and not many minutes after, he related the arrangement, with a smile, to his spouse. Miranda turned pale, and at once seeing through the policy of the wily savage, unbosomed herself of the whole to Lara and her husband. Horrified at the suit, and filled with forebodings, Nunez, who blamed his own overcaution as in fault, would have at once seized upon the Timbuez, and kept him as a hostage for the good behaviour of his people. The council of officers, however, dissuaded the worthy general from so doing, and meanwhile Mangora departed.

For some months the king of Tucuman continued his attentions, though Miranda never showed herself, and Sebastian, under various pretences, deferred his promised visit. Mangora, however, appeared to have forgotten the very existence of the lovely Andalusian, as he never once alluded to her absence, and received the excuses of the husband in good part. In this manner a whole winter passed, when, towards the spring, provisions grew scarce. The Timbuez, who occasionally brought a supply, had not been seen for ten days, and famine threatened the camp. At this juncture Sebastian Hurtado, with Ruiz Moschera and fifty men, started on a hunting expedition up the river, as much in the hope of relieving the rest by their absence, as of bringing in fresh provender for those who remained behind. Game, however, being plenty at some distance, it was more than probable the journey might be attended with beneficial results. Nunez de Lara, therefore, saw his brave lieutenant and friend depart with satisfaction, which was further enhanced by the appearance, within a few hours, of Mangora, attended by thirty men loaded with eatables, and a large quantity of a native intoxicating drink. The king intimated that, hearing of the scarcity which prevailed among his brothers and allies, he had brought them sufficient to keep famine from the tower of Cabot until the return of the foraging expedition. Lara, delighted at so timely a succour, thanked the monarch of Tucuman warmly, and invited him to a banquet, of which his own presents formed the principal ingredients. Mangora and his followers accepted so agreeable an offer with alacrity, and at dusk the feast commenced. Carried away by such unusual good cheer, and deprived of reason by the deep draughts they quaffed of native wine, the Spaniards prolonged their sitting until midnight, when Mangora gave a signal for which his warriors had long been waiting. Up rose the Timbuez, and dashing lighted torches amid the wooden tenements, fell upon their entertainers, while thousands of savages, concealed in the marsh, burst upon the devoted garrison. The Spaniards, encouraged by the gallant Nunez de Lara, drew and defended themselves with a desperate valour, which drove their assailants to the very stockades. But hundreds of fresh savages poured in, and the whites began to diminish rapidly in numbers. When the confusion was at its height—when the whole fort was in flames, that rose crackling and with clouds of dense smoke to the skies—when nought was heard but the groans and anguish of the dying, mingled with the shouts of victory and the cries of the vanquished—Mangora rushed from the inner tower, bearing in his arms his prize—the lovely Miranda. Lara now stood alone, his faithful soldiers being all dead around him, and he himself pierced with innumerable wounds. At the sight of the triumphant chief, whose savage passions had caused all the scene of desolation around, Nunez felt his whole vigour revive, and, dashing furiously towards the king, with one well-aimed blow he stretched Mangora a corpse at his feet. The next instant he lay beside him.

The victorious Timbuez, wailing over the loss of their king, slain in the very act of gaining the prize for which he had sacrificed so much, now took their departure, bearing with them into captivity Miranda and the other women. In half an hour silence and desolation reigned without dispute over the smouldering ruins of the fort, until soon the sneaking wolf and turkey buzzard, the scavengers of America, came for their horrid feast. Flying in circles round the spot, carefully to reconnoitre, the latter made no effort to pounce upon their prey, but gradually settled down in heavy groups upon the boughs of neighbouring trees. It was evident there was still life upon the plain, and that the instinct of the buzzard warned it its time was not yet come. One solitary being of all those so gay and joyful on the previous night remained alive—the gallant, brave, and devoted Nunez de Lara. He was dying, it was true; but such is the dread of all the lesser creation for man, that not a fowl of the air, nor a beast of the field, dared venture too close to the scene of the late conflict. Lara had raised himself against the remains of a wood-pile, his face being turned towards the river, where, on the previous day, the flotilla of Hurtado had disappeared. As the old man hoped, towards the afternoon Sebastian, who afar off had discovered the smoke of the conflagration, returned with his men, and stood pale and trembling beside his chief.

'My wife!' cried the young soldier, gazing in horror on the terrible consequences of man's bad passions that lay around.

'Is alive,' replied the dying Lara. 'Mangora——'

'In his hands?' shrieked Sebastian Hurtado; 'better were she dead.'

Lara was unable to reply for some minutes; and then, with much difficulty, he succeeded in giving a detailed account of all that had passed. The husband, whose grief was excessive, was somewhat relieved in his mind when he heard that the ravisher had lost his life in the very moment of victory; and, previous to working for Miranda's deliverance, devoted himself to his dying friend, while Ruiz Moschera attended to the repairs which the fort demanded. Before night, the spirit of the old soldier departed, and he was buried upon a spot still known as Lara's grave. The husband then summoned all the survivors, and appointing Ruiz his lieutenant, departed alone in search of his wife, after leaving strict orders with his men to intrench themselves still more securely, lest the ruthless enemy should once more surprise them. He went away, amid the tears and intreaties of all, who would have fain dissuaded him from his solitary and perilous adventure. The difficulties which Hurtado encountered, both in tracking the retreating foe, and in finding the food which sustained him on his enterprise, would require many pages to detail; it must suffice to say, that at the end of eleven days he came in sight of the Timbuez village, on the slope of the Tucuman hills. Foot-sore and weary, the anxious husband gazed

* The writer cannot but feel that any advance towards civilisation in savages is so much gained. His personal experience never made him aware of anything in uncivilised life which counterbalances the ignorance and brutality which mainly attend it. His opinion is the same as that expressed by the editors, No. 329, old series, in a note on the pretty tale of Couramé.

curiously on the place which served as the prison to the wife he so dearly loved. The village was extensive, being composed of a series of vast sheds, beneath which dwelt entire clans—the whole being surrounded by a rampart of furze. Sebastian, who looked on from a neighbouring wood, had scarcely concluded his survey, when he observed one leave the habitations, at the sight of whom his heart leaped, and all his hopes revived with tenfold vigour. It was Miranda, strolling leisurely across the plain which divided the town from the forest. To call her name, to rush to meet her, and to be clasped in one another's arms, was the work of a moment—a moment, however, of delicious happiness for both. After the first transport of joy was over, Sebastian drew his wife to the shade of the forest, and there, after seating her beside him on a fallen tree, addressed questions as to her adventures.

'Thank Heaven,' he said, 'Mangora is no more; his persecutions are not to be feared.'

'Alas! my husband,' replied Miranda faintly, 'I have worse. His brother Siripa, now king, is as hatefully pressing in his attentions as he was himself.'

The unfortunate wife then related to her grieving husband, that no sooner had Siripa, the reigning cacique, set eyes on her, than he had at once expressed a wish to make her his wife. In the words of the judicious Jesuit who, amongst others, narrates this singular history, 'The new cacique, at the sight of Miranda, conceived for her the same passion which had proved so fatal to his brother; he reserved her alone for himself from amid the little troop of captives, and had her at once set free. He, moreover, informed her that she was not to consider herself a slave, but might aspire to be queen of Tucuman; of course, he said, she could not hesitate between a poor and powerless husband and the chief of a great nation, who placed himself and all his people at her feet. Miranda had nothing to expect, in case of a refusal, but to pass her days in wretched and hopeless slavery. She hesitated not a moment, however, between duty and fear; she even gave Siripa such an answer as was most likely to irritate him, in the hope that his passion would change to fury, and that, by killing her at once, her honour might be known to all as without stain or tarnish. She was mistaken. Her refusal added strength to the passion of the savage monarch, and gave additional vivacity to his actions. The cacique hoped in the end to overcome the resistance of this noble-minded woman; and, in the meantime, treated her with an attention and even devotion of which such a barbarian was rarely thought capable.'

Such, in other words, was the extent of Miranda's information, which would doubtless have been extended, had the pair not both been suddenly startled from their dream of security by the presence of a dozen Timbuez, who surrounded them in silence, and carried them before Siripa. That potentate was seated on a species of throne. His brow was contracted; his whole mien betrayed the furious passions which were now uppermost in his bosom. The sight of Sebastian Hurtado, whose existence he fain hoped alone stood between him and a union with Miranda, roused within him thoughts of the blackest kind, and, without hearing a word the young soldier had to say, he commanded him to be tied to a tree, and shot to death with arrows. His followers proceeded to obey his orders. The unfortunate husband was fastened to the nearest trunk; the bows were ready strung for their murderous office, when Miranda rushed wildly to the monarch's feet, and with all the energy of a woman's affectionate nature, with many tears and many protestations, begged the life of him she loved. Siripa, at length moved to compassion, relented from his purpose, and commanded the Spaniard to be released and brought before him. Sebastian would have thanked him, but Siripa stayed his thanks with a savage sneer. 'White man, your life is granted you, but you lose your wife for ever. To-morrow you shall depart for the country of the Guaycuras Guazas, my cousin; and if, in the meantime, you attempt to speak one with the other, or are even seen in company, you both die.'

With these words he dismissed them, purposely, it is supposed, leaving them free, to induce them to break through his orders. He succeeded fully; for both Sebastian and Miranda were determined to attempt that very night an escape from the power of their oppressor. They accordingly hastily appointed a meeting in the hut which was usually occupied by Lucia; and, as soon as darkness fell upon the whole scene, thither Sebastian crept, to arrange with his beloved their flight. It was decided to take place an hour before dawn, after which the anxious pair lay down to seek that rest both so much needed. But the wife of Siripa, moved by jealousy, had closely watched them; and hastening to the cacique, informed him that they were together. Furious at the news, the king himself came to arrest them, and, while still under the influence of passion, ordered their immediate execution. The fond pair resolved to die as they had lived—devoted and true. They, therefore, dismissing all hope from their minds, bent their thoughts on death. Sebastian attempted to console his lovely partner, but his voice failed him; and both sat on the threshold of their hut, gazing with glazed eye upon the preparations which were being made. It was dawn ere all were completed, and then they saw that the wife was to be burnt at the stake, while Sebastian was to be shot to the heart with arrows. Taking one long and last farewell embrace, the faithful couple were dragged apart, and led each to their appointed place, while Siripa looked on with gloomy brow and compressed lips. Not a sign of clemency did he give; indeed he had raised his hand as the fatal signal, when Ruiz Moschera, at the head of his gallant Spaniards, and supported by a hundred Portuguese cavalry, commanded by Edward Perez, from Brazil, poured out from the wood, and attacking the Timbuez, put the whole to flight. Many lost their lives, and amongst the rest Siripa.

Thus were Sebastian Hurtado and Miranda rescued from the very jaws of death by the opportune arrival of succour—an event which the worthy Charleroix treats as a special miracle performed by St Blaise, the patron of Paraguay. In a few hours the cavalcade returned towards Cabot's Tower, which they utterly destroyed, and then sailing down the river, established themselves in a safer position near the sea, where they founded Buenos Ayres. To this day there live, in this place, the descendants of Miranda Hurtado.

HORACE MANN'S EDUCATIONAL TOUR.

Some of our readers may recollect an account of the Rauhe Haus of Hamburgh, which appeared in the Journal for 30th August last year. It was extracted from a report on education in Europe, written by Mr Horace Mann, the secretary of the Board of Education in the state of Massachusets. We are glad to find that this remarkable document has now been reprinted for the British public, under the care of Dr Hodgson, principal of the Mechanics' Institution of Liverpool.* It is the production of such a mind as, unfortunately, we see but rarely devoted to the subject of education; one expressing, we would say, the highest tone of moral and intellectual culture, and yet as careful respecting the practical details of its subject, as it is profoundly reflective on general aims and results.

The immediate object of Mr Mann in his tour was to describe teaching arrangements, and modes in use, in European countries, which he thought might be advantageously transferred to his own. His report is therefore mainly of a practical character, and calculated to be directly useful to teachers, and all who have any charge in educational institutions; for which reason we strongly recommend the present volume to their atten-

tion. Yet such is the character of the author's mind, that the whole reads like a philosophical treatise.

A considerable portion of the volume is occupied with memoranda on the schools of Germany, which Mr Mann describes as superior to the character of the existing institutions of the country, but such as must soon force improvements in these, whether the governors choose or not. We cannot go into any comprehensive view of this subject; but the reader, we think, may obtain some idea of the interest which the author imparts to all his details, by the following account of the manner in which he found geography taught in a Prussian school. 'The teacher stood by the black board with the chalk in his hand. After casting his eye over the class, to see that all were ready, he struck at the middle of the board. With a rapidity of hand which my eye could hardly follow, he made a series of those short, divergent lines, or shadings, employed by map-engravers to represent a chain of mountains. He had scarcely turned an angle, or shot off a spur, when the scholars began to cry out—Carpathian mountains, Hungary; Black Forest mountains, Wirtemberg; Giant's mountains (Riesen-Gebirge), Silesia; Metallic mountains (Erz-Gebirge), Pine mountains (Fichtel-Gebirge), Central mountains (Mittel-Gebirge), Bohemia, &c. &c.

'In less than half a minute, the ridge of that grand central elevation which separates the waters that flow north-west into the German Ocean from those that flow north into the Baltic, and south-east into the Black Sea, was presented to view—executed almost as beautifully as an engraving. A dozen crinkling strokes, made in the twinkling of an eye, represented the head waters of the great rivers which flow in different directions from that mountainous range; while the children, almost as eager and excited as though they had actually seen the torrents dashing down the mountain sides, cried out—Danube, Elbe, Vistula, Oder, &c. The next moment I heard a succession of small strokes or taps, so rapid as to be almost indistinguishable; and hardly had my eye time to discern a large number of dots made along the margins of the rivers, when the shout of Lintz, Vienna, Prague, Dresden, Berlin, &c. struck my ear. At this point in the exercise, the spot which had been occupied on the black board was nearly a circle, of which the starting point, or place where the teacher first began, was the centre; but now a few additional strokes around the circumference of the incipient continent extended the mountain ranges outwards towards the plains—the children responding the names of the countries in which they respectively lay. With a few more flourishes, the rivers flowed onwards towards their several terminations; and by another succession of dots, new cities sprang up along their banks. By this time the children had become as much excited as though they had been present at a world-making. They rose in their seats, they flung out both hands, their eyes kindled, and their voices became almost vociferous, as they cried out the names of the different places which, under the magic of the teacher's crayon, rose into view. Within ten minutes from the commencement of the lesson, there stood upon the black board a beautiful map of Germany, with its mountains, principal rivers, and cities, the coast of the German Ocean, of the Baltic and the Black Seas; and all so accurately proportioned, that I think only slight errors would have been found had it been subjected to the test of a scale of miles. A part of this time was taken up in correcting a few mistakes of the pupils, for the teacher's mind seemed to be in his ear as well as in his hand; and notwithstanding the astonishing celerity of his movements, he detected erroneous answers, and turned round to correct them. The rest of the recitation consisted in questions and answers respecting productions, climate, soil, animals, &c.

'Many of the cosmogonists suppose that, after the creation of the world, and when its whole surface was as yet fluid, the solid continents rose gradually from beneath the sea. First the loftiest peaks of the Andes, for instance, emerged from the deep, and as they reached a higher and a higher point of elevation, the rivers began to flow down their sides, until at last—the lofty mountains having attained their height, the mighty rivers their extent and volume, and the continent its amplitude—cultivation began, and cities and towns were built. The lesson I have described was a beautiful illustration of that idea—with one advantage over the original scene itself, that the spectator had no need of waiting through all the geological epochs to see the work completed.

'Compare the effect of such a lesson as this, both as to the amount of the knowledge communicated, and the vividness, and of course the permanence, of the ideas obtained, with a lesson where the scholars look out a few names of places on a lifeless atlas, but never send their imaginations abroad over the earth, and where the teacher sits listlessly down before them to interrogate them from a book, in which all the questions are printed at full length, to supersede on his part all necessity of knowledge.'

All this must be equally new and interesting to the greater portion of our public. So, we thoroughly believe, will be the following account of the general conduct and bearing of the Prussian teachers amongst their pupils. It is even, we would say, affecting to hear of the activity and self-devotion of these most useful ministers, paid as they generally are below the gains of many ordinary tradesmen. 'I have said that I saw no teacher *sitting* in his school. Aged or young, all stood. Nor did they stand apart and aloof in sullen dignity. They mingled with their pupils, passing rapidly from one side of the class to the other, animating, encouraging, sympathising, breathing life into less active natures, assuring the timid, distributing encouragement and endearment to all. The looks of the Prussian teacher often have the expression and vivacity of an actor in a play. He gesticulates like an orator; his body assumes all the attitudes, and his face puts on all the variety of expression, which a public speaker would do, if haranguing a large assembly on a topic vital to their interests.

'It may seem singular, and perhaps to some almost ludicrous, that a teacher, in expounding the first rudiments of handwriting, in teaching the difference between a hair-stroke and a ground-stroke, or how an *l* may be turned to a *b*, or a *u* into a *w*, should be able to work himself up into an oratorical fervour, should attitudinise, and gesticulate, and stride from one end of the class to the other, and appear in every way to be as intensely engaged as an advocate when arguing an important cause to a jury; but strange as it may seem, it is nevertheless true; and before five minutes of such a lesson had elapsed, I have seen the children wrought up to an excitement proportionally intense, hanging upon the teacher's lips, catching every word he says, and evincing great elation or depression of spirits as they had or had not succeeded in following his instructions. So I have seen the same rhetorical vehemence on the part of the teacher, and the same interest and animation on the part of the pupils, during a lesson on the original sounds of the letters—that is, the difference between the long and the short sound of a vowel, or the different ways of opening the mouth in sounding the consonants *b* and *p*. This zeal of the teacher enkindles the scholars. He charges them with his own electricity to the point of explosion. Such a teacher has no idle, mischievous, whispering children around him, nor any occasion for the rod. He does not make desolation of all the active and playful impulses of childhood, and call it peace; nor, to secure stillness among his scholars, does he find it necessary to ride them with the nightmare of fear. I rarely saw a teacher put questions with his lips alone. He seems so much interested in his subject (though he might have been teaching the same lesson for the hundred or five hundredth time), that his whole body is in motion—eyes, arms, limbs, all contributing to the impression he

desires to make; and at the end of an hour, both he and his pupils come from the work all glowing with excitement.

'Suppose a lawyer in one of our courts were to plead an important cause before a jury, but instead of standing and extemporising, and showing by his gestures, and by the energy and ardour of his whole manner, that he felt an interest in his theme; instead of rising with his subject, and coruscating with flashes of genius and wit, he should plant himself lazily down in a chair, read from some old book, which scarcely a member of the panel could fully understand, and, after droning away for an hour, should leave them, without having distinctly impressed their minds with one fact, or led them to form one logical conclusion—would it be any wonder if he left half of them joking with each other, or asleep? Would it be any wonder—provided he were followed on the other side by an advocate of brilliant parts, of elegant diction, and attractive manner, who should pour sunshine into the darkest recesses of the case—if he lost not only his own reputation, but the cause of his client also?

'In Prussia and in Saxony, as well as in Scotland, the power of commanding and retaining the attention of a class is held to be a *sine qua non* in a teacher's qualifications. If he has not talent, skill, vivacity, or resources of anecdote and wit sufficient to arouse and retain the attention of his pupils during the accustomed period of recitation, he is deemed to have mistaken his calling, and receives a significant hint to change his vocation.

'Take a group of little children to a toy-shop, and witness their outbursting eagerness and delight. They need no stimulus of badges or prizes to arrest or sustain their attention; they need no quickening of their faculties by rod or ferule. To the exclusion of food and sleep, they will push their inquiries, until shape, colour, quality, use, substance, both external and internal, of the objects around them are exhausted; and each child will want the showman wholly to himself. But in all the boundless variety and beauty of nature's works—in that profusion and prodigality of charms with which the Creator has adorned and enriched every part of his creation—in the delights of affection—in the ecstatic joys of benevolence—in the absorbing interest which an unsophisticated conscience instinctively takes in all questions of right and wrong—in all these, is there not as much to challenge and command the attention of a little child as in the curiosities of a toy-shop? When as much of human art and ingenuity shall have been expended upon teaching as upon toys, there will be less difference between the cases.

'The third circumstance I mentioned above, was the beautiful relation of harmony and affection which subsisted between teacher and pupils. I cannot say that the extraordinary fact I have mentioned was not the result of chance or accident. Of the probability of that others must judge. I can only say that, during all the time mentioned, I never saw a blow struck; I never heard a sharp rebuke given; I never saw a child in tears, nor arraigned at the teacher's bar for any alleged misconduct. On the contrary, the relation seemed to be one of duty first, and then affection, on the part of the teacher—of affection first, and then duty, on the part of the scholar. The teacher's manner was better than parental; for it had a parent's tenderness and vigilance, without the foolish dotings or indulgences to which parental affection is prone. I heard no child ridiculed, sneered at, or scolded, for making a mistake. On the contrary, whenever a mistake was made, or there was a want of promptness in giving a reply, the expression of the teacher was that of grief and disappointment, as though there had been a failure not merely to answer the question of a master, but to comply with the expectations of a friend. No child was disconcerted, disabled, or bereft of his senses through fear. Nay, generally at the ends of the answers, the teacher's practice is to encourage him with the exclamation, "good," "right," "wholly right," &c. or to check him with his slowly and painfully-articulated "no;" and this is done with a tone of voice that marks every degree of *plus* and *minus* in the scale of approbation and regret.'

MRS OGILVY'S HIGHLAND MINSTRELSY.

In an elegant small quarto, beautifully printed and embellished, appears a collection of romantic poems, under the title of *A Book of Highland Minstrelsy*.* The author, we understand, is a young married lady, of Scottish parentage and connexions, residing in London. The poems chiefly relate to traditions and superstitions of the Scottish mountains; and strikingly beautiful poems they are, with hardly an exception. Mrs Ogilvy has evidently entered cordially into the wild and melancholy spirit of the Gael; she has been most industrious in gathering their fading legends: their dreamy supernaturalities have laid powerful hold of her imagination. Thus prepared, her rich powers of poetical expression have enabled her to present a volume which every reader of feeling and taste must, we think, appreciate—a remarkable exception from the forced fruits and tiresome conventionalisms of the common literary mind of the day. The attractions of the volume are heightened by truthful and characteristic drawings from the pencil of M'Ian. Altogether, it is a very delightful book—an issue from Nature's own ever fresh and genial press; and if it does not meet with large success, both in north and south, we shall be much surprised.

In glancing over the volume for the selection of extracts, we feel distraught among the claims of so many fine things. The *Shrift of Janet Campbell*, as a specimen of the sternly tragic; the *Parting on the Brig*, as an example of mournful domestic feeling; the *Vow of Ian Lom*, as an old tradition admirably versified; and many others, call for special notice. But our limits condemn us to one subject, and that of course ought to be as generally characteristic as possible. We therefore pitch upon a piece entitled *Lord Murray*, in which we think many of the graces of the book are combined; for it is at once a narrative, an illustration of a superstition, a reference to beautiful affections, and a happy specimen of poetical expression:—

At break of day, to hunt the deer,
Lord Murray rides with hunting gear;
Glen Tilt his boding step shall know,
The 'minished herd his prowess show;
And savoury haunch and antlers tall
Shall grace to-morrow's banquet hall.

Lord Murray leapeth on his horse,
A little hand arrests his course;
Two loving eyes upon him burn,
And mutely plead for swift return—
His lady stands to see him go,
Yet standing makes departure slow.

'Go back, my dame,' Lord Murray said,
'The wind blows chilly on thy head;
Go back into thy bower and rest,
Too sharp the morning for thy breast.
Go tend thy health, I charge on thee,
For sake of him thou'st promised me.'

Lord Murray gallops by the brae,
His huntsmen follow up the Tay,
Where Tummel, like a boyden girl,
Leaps o'er the croy with giddy whirl,
Falls in Tay's arms a silenced wife,
And sinks her maiden name for life.

Lord Murray rides through Garry's den,
Where beetling hills the torrent pen;
And as he lasheth bridge and rock,
The caves reverberate the shock,
Far as the cones of Ben-y-Glo,
That o'er Glen Tilt their shadows throw.

* Nickisson. London. 1848.

Great sport was his, and worthy gain,
The noblest of the herd were slain;
Till, worn with chase, the hunter sank
At evening on a mossy bank;
And as his strength revived with food,
His spirit blessed the solitude.

A silvery mist the distance hid,
And up the valley gently slid;
While, softened, through its curtain white
The lakes and rivers flashed their light,
And crimson mountains of the west
Cushioned the sun upon their breast.

Hushed was the twilight, birds were dumb,
The midges ceased their vexing hum,
And floated homewards in their sleep;
All silent browsed the straggling sheep;
E'en Tilt, sole tattler of the glen,
Ran voiceless in Lord Murray's ken.

An infant's cry! such hails at birth
The first-pained feeble breath of earth;
Lord Murray starteth to explore,
But there is stillness as before.
Nothing he sees but fading skies,
The cold, blue peaks, the stars' dim eyes,
The heather nodding wearily,
The wind that riseth drearily:
It was a fancy, thinketh he;
But it hath broke his reverie.

In closing night he rideth back,
His heart is darker than his track;
It is not conscience, dread, or shame—
His soul is stainless as his name—
But shapeless horrors vaguely crowd
Around him, black as thunder-cloud.

He spurs his horse until he reach
His castle's belt of aged beech;
His lady sped him forth at morn,
But silence hails his late return;
The little dog that on her waits,
Why runs he whining at the gates?

Lord Murray wonders at the gloom,
His halls deserted as the tomb,
And all along the corridors
Against the windows swing the firs;
Closed is his lady's door—he stands,
Too weak to ope it with his hands,
Yet bursteth in he knows not how,
And looks upon his lady's brow.

She lay upon their bridal bed,
Her golden tresses round her shed,
Her eyelids dropped, her lips apart,
As if still sighing forth her heart,
But cold and white, as life looked never,
For life had left that face for ever.

On her bosom lay a child,
Flushed with sleep wherein it smiled—
Sleep of birth and sleep of death,
Icy cheek and warm young breath,
Rosy babe and clay-white mother
Stilly laid by one another.

The nurse, a woman bowed with years,
Knelt by the bed with bursting tears,
And wailed o'er her whose early bloom
She thus had nurtured for the tomb.
A piteous sight it was, in sooth—
The living age, the perished youth.

'The way is long,' at last she said;
'Oh, sorrowing lord, the way is dread,
Through marsh and pitfall, to the rest
God keeps for those who serve Him best;
And unto man it ne'er was given
To win with ease the joys of heaven.

But Mary, queen beside her son,
Such grace for woman's soul hath won
(Remembering the manger rude,
Her pangs of virgin motherhood),
That blessed most of mortals they
Whose life, life-giving, flows away.

No pains of purgatory knows
The sleeper in that deep repose,
No harsh delays in upper air
The mother, birth released, must bear;
For angels near her waiting stand,
And lift her straight to God's right hand.

No masses need ye for her soul,
Round whom the heavenly censers roll;
Pure as the babe she bore this day,
Her sins in death were washed away;
To win him life 'twas hers to die,
And she shall live in heaven for aye;
Pale in our sight her body lies,
Her soul is blessed in Paradise!'
Lord Murray's voice took up the word,
'Her soul is blessed, praise the Lord!'

WAGERS.

THERE are three leading kinds of wagers—those designed to settle a difference of opinion on a question of fact, those speculating merely upon a doubtful future event, and those in which some feat is undertaken under a forfeiture. All are alike contrary to rationality. It may even be said of some wagers that they are immoral. For instance, the second of the above classes is merely a variety of gambling, and therefore not one word can be said in its favour. Those, again, which involve danger to the person of one or other of the parties are utterly indefensible.

There are some things in the history of this absurd practice worthy of being noted. Casuists and legislators have differed very much as to the way in which betting should be regarded in public policy. The general inference to be drawn from the various arguments adduced on both sides of the question is, that it is lawful, unless the object of it bear upon private wishes or criminal actions. As, for example, when, having wagered that such a person will die at such a time, the desire of winning, and the fear of losing, makes the bettor desire, or perhaps hasten, the death of that person; or when the wager is to be won by either the commission of crimes, or the causing others to commit them.

There are other examples of unlawful wagers in which injustice and fraud are included. Injustice, when, of two bettors, the one is certain, the other uncertain of winning; fraud, when a party engages, by evil means, or by equivoques in terms or intention, to perform any action—as in the celebrated wager of Cleopatra with Mark Anthony. Cleopatra invites Anthony to supper, and wagers that she alone will eat, at one meal, a sum equal to L.80,729, 3s. 4d. Anthony, seeing nothing extraordinary, begins to rally the queen on the frugality of her table. She makes no reply, but detaches from her ears two pearls of great price, one of which she throws into a liquor prepared for the purpose, by which it is speedily dissolved, and swallows it in the presence of Munatius Plaucus, the chosen arbiter of the wager; and as she is about to do the same with the other pearl, Plaucus snatches it away, exclaiming that she had already won.

The wager of Asclepiades the physician was not less extravagant. He wagered against Fortune that he would never be ill during his life, under penalty of losing the reputation he had acquired of being the most famous physician of his time. It is true that he won his wager; for in fact he never was ill while he lived, having died from a fall in extreme old age.

In several states we find that various kinds of wagers are prohibited, some of which are of very little consequence. At Rome it is unlawful to make wagers on the death or exaltation of the popes, and on the promotion of the cardinals. In several republics it is also forbidden, under heavy penalties, to make wagers without the permission of the magistrate; at Venice, on the election of persons to fill the public offices; at Genoa, on the revolutions of states and kingdoms, the success of military expeditions, purposed marriages, and the departure or arrival of vessels. Bugnion mentions an act of the parliament of Paris of 1565, which made it unlawful to make a pregnant female the subject of a wager.

In ancient Rome it was forbidden, by the law Titia and the law Cornelia, to bet upon the success of unlawful games, or of any game whatever, with the exception of those in which courage, address, and bodily strength were to be tested; in which cases the bettors were accustomed to place in the hands of a third party

the signet rings which they wore on their fingers, as a gage or pledge. This deposit, which held the place of a stipulation, rendered the wager obligatory, and produced an action at law; which proves that consignment is absolutely necessary to make the engagement valid. The terms consignment and wager are used indifferently by lawyers. The etymology of the word wager, or gager, which comes from gage, shows that wagers are not considered serious conventions, unless the gage has been deposited.

However, where address and bodily strength are concerned, the wager is obligatory, even though the gage has not been deposited: and this is the exception to the rule; for the gage or stake is properly the reward of the address and danger incurred by the subject of the wager. Thus the Count de ——, in his wager against the Duke de —— (which he won), even though he had not consigned, would, if he had lived, have had an action against his adversary. In ancient Greece, the count would have borne away the prize in the horse race at the Olympic games. The following is the history of this wager:—

The count betted 10,000 crowns against the duke, that in six hours he would go twice, and back again, from the Porte St Denis to Chantilly. He had his whole body tightly bandaged round, and a leaden bullet in his mouth to refresh him, by keeping up a supply of moisture. Relays of horses were disposed from space to space, and every embarrassment prevented that might in the least retard his progress. The swiftest horses were chosen. A clock was attached to the Porte St Denis, to mark the time. He set out with the speed of an arrow, and in a moment was out of sight. Never did man cleave the air with such rapidity. On arriving at each relay, without alighting, he sprang from one horse on to the other, and continued his flight. He arrived at the Porte St Denis, having performed his four courses eighteen minutes before the appointed time! He said he was still able to go to Versailles to bring the king tidings of his success. All bathed in perspiration, he was put into a warm bed, and, five months afterwards, died from the effects of this effort. This nobleman, remarks the narrator of his exploit, deserves no praise for having run such a race. All that can be said of him is, that he would have made the best post-boy in the world.

Another wager may be mentioned, the wildness of which was the cause of great excitement at the time it was made.

The year 1726 was so rainy, that it seemed as if the flood-gates of heaven were opened. All the rivers overflowed their banks, to the great prejudice of commerce. There were some superstitious persons who announced a second deluge. A Parisian banker named Bulliot having remarked that it had rained excessively on St Gervais' day (19th June), persuaded himself that it would continue to rain for forty days. The motive of this opinion was a proverb current among the people:

S'il pleut le jour de St Gervais,
Il pleut quarante jours après.*

Infatuated by this opinion, and being on that day in the Café de la Regence, near the Palais Royal, he entered into conversation with some persons on the subject of the incessant inundations which were destroying the hopes of a good harvest, and exciting apprehensions of a very great rise in the price of corn. Bulliot observed that there would be more cause for alarm if the rains continued for forty days longer, and that he was ready to wager that this misfortune was inevitable. This evil prognostic was but badly received by those present, who inquired upon what he founded it. 'I am sure of it,' he confidently replied. 'Let any one bet against me; I am ready to put down my stake.' He then threw some louis upon a table, to excite the curious, and defy the incredulous. As his speech was not very sensible, several persons refused to enter the lists against him; but others, more interested, flattered by the hope of winning, put down stakes to the same amount as he did. The money was deposited in the hands of the coffee-house keeper, and the wager registered in the following terms:—'If it rain little or much during forty days from St Gervais' day, Bulliot has won; if it discontinue raining even for one single day during the forty days, Bulliot has lost.'

This wager irritated the cupidity of the whole café, who were eager to appropriate the louis in which Bulliot so abounded; so that, after having staked against all who would bet against him, and after having emptied every purse, he demanded, with a sort of insult, if there were any others ready to oppose him. Believing himself sure of victory, he proposed to those who had no money to stake their gold-headed canes, gold snuff-boxes, and other valuable jewellery; which were duly appraised, and placed in the hands of the same depositary; for all which he put down full value in specie. He even consented that those who had neither money nor jewels should deposit their Holland shirts, against which he also consigned their value in money.

The contagion of this folly having spread abroad, the next day brought a fresh reinforcement of antagonists, who presented themselves at the same café to put down their stakes against Bulliot. But his money being at length exhausted, he offered those new-comers bills payable to the bearer, or letters of exchange. As he was in good repute, and had always honoured his engagements, his proposal was accepted. He gave bills and letters of exchange to the amount of nearly 50,000 crowns; all which were likewise deposited. It might be said of Bulliot that he was alone against all, and that if he won, he would make the finest haul in the world; whilst the whole troop of his adversaries would be ruined by the inclemency of the weather.

Fame, as usual, added new embellishments to this story, as she sped it on from ear to ear, through city and court. Every one was anxious to see this extraordinary man. Those who knew him by sight, pointed him out to those who did not. His countenance was attentively observed, and eyes were opened wide upon him. When asked why he was so steadfast in his opinion, he alleged the proverb before mentioned, which the people have adopted more for rhyme than reason.

A nobleman of high rank jestingly said, that if Bulliot won, he should be tried for sorcery; and that if he lost, he should be put in bedlam. In fine, he was the subject of every conversation. The comedians, ever alive to the whim of the hour, acted him in the several theatres.

At length, in spite of the proverb, the windows of heaven were closed before the expiration of the forty days. The coffee-house keeper and the other depositaries accordingly gave up the stakes to those who had won. The bearers of the bills and letters of exchange had not the same luck. Bulliot's relatives caused him to be interdicted as a prodigal.

Several of the bettors, unwilling to engage themselves in a lawsuit of such doubtful event, returned their bills and letters of exchange; others, more avaricious, embarked upon the stormy sea of the courts. The suit, which was first brought to the Chatelet, came at length before the parliament. The bettors, wishing to put the best face possible upon their claim, said nothing about the wager. They only represented that they were merchants, who had accepted the bills in question with confidence, on account of the established credit of Bulliot, who had hitherto satisfied all his creditors; that, to oppose to their claim the interdiction of their debtor, who was not bound by that interdiction at the time of his engagement with them, was to violate the public faith; that, if creditors could be eluded in this way, foreigners would lose all confidence in us; finally, that the good faith of commerce, which is the soul of it, required that the merchants who had given value for those bills, having no reason to distrust Bulliot, should be satisfied. Bulliot's brother, who had been appointed

* If it rain on St Gervais' day, it will rain for forty days afterwards.

his guardian, made the truth so fully apparent by presumptive proofs and the date of the bills, that, at the end of 1726, a verdict was returned for the defendant, annulling all the wagers.

BUSINESS HABITS.

BY A MAN OF BUSINESS.

THIS is the title of an article which appears in a recent number of the Bankers' Magazine*—a periodical of merit and utility. Desirous of making the acquaintance of a man of business in a literary capacity, we sat down to the perusal of his article with some avidity, and were not disappointed in finding another, in addition to many proofs, that respectable literary and scientific attainments are by no means incompatible with that manifestation of talent commonly spoken of as 'well adapted to business.' The sentiments of the writer are clearly and well expressed; his style, as might be expected, more precise than showy, and direct rather than attractive. The best recommendation, however, that we can give to them, as well as to the medium through which they originally appear, is their partial transference to our columns—a transference which may at the same time gratify a number of readers curious as we were to discover what sort of a portrait a man of business would draw of the habits and acquirements of his class.

Setting out with the maxim, that all habits are acquired, and that 'habit,' in its ordinary acceptation, implies that peculiar manner, practice, and conduct which distinguishes different classes of men, and every man from another, our author thus proceeds with his subject:—

'The phrase "business habits" applies to men who live by the exercise of their intellect rather than by their manual labour; who do not engage in out-door occupations, but follow certain professions—such as the law, banking, and the higher mercantile departments—to the duties of which they require to be trained and educated from an early period of life. These duties can only be efficiently and satisfactorily discharged by a daily seclusion, for certain hours, from domestic and other cares, and from the pleasures and enjoyments of the world. They call into exercise many of the higher qualities of the mind, and exact confinement to the desk and the counting-house; and demand a greater or less acquaintance with the operations of our own minds, the characters and pursuits of others, the laws and practices of nations, the calculation of causes and consequences, as well as the knowledge of figures and accounts.

'The conventional arrangements of society have prescribed the hours and rules of business as well as of labour—regularity in the observance of which forms one of the numerous avenues to success. Particular departments of business have also particular periods when they must be attended to, and every department has a particular manner in which it must be conducted. This is essential to regularity and clearness in working out the details, and prevents any confusion and loss which might otherwise result.

'Every man who aims at becoming a clever and successful man of business, must also exhibit a regular and becoming line of conduct—he must have a character for regularity and attention to his duties—he must deny himself in a great measure, if not entirely, to the many frivolous and extravagant pleasures and amusements with which men of the world contrive to abuse and destroy the time and talents God has granted them. He is shut up during the greater part of the day in his counting-house and office, and perhaps can only command an hour or two in the mornings and evenings for relaxation and healthful exercise. That method and regularity which is demanded in his attention to business, insensibly, and in some measure necessarily, forms and confirms his private and domestic conduct. * * The influence of these business habits regulates even the thoughts and opinions; that is to say, induces a more systematic mode of thinking and judging, and assists more largely in the development of the moral and intellectual powers, than is perhaps done by the influence of any other worldly habits.

'Besides being regular and punctual in attendance on his duties, it is desirable that a man of business should be a man of strict moral integrity. This is of indispensable importance; although, unfortunately, it does not necessarily follow the possession of business habits. Many men of excellent business habits are known to be utterly devoid of all principle of moral rectitude, and of that integrity which is as important for the maintenance and advancement of truth, as for the safe-keeping of our own and our neighbours' property and good name. One-half of the evils, the confusion, and misunderstanding which prevails in the world, arises from the suppression and perversion of the truth—from a selfish and jealous distrust of the actions of our fellow-creatures—and from a desire to overreach and rise above them. But that principle of moral rectitude, more especially alluded to at present, as essential to the character of a man of business, is comprised in the two commands, "Thou shalt not steal," "Thou shalt not bear false witness." His success depends much upon the extent to which these precepts are observed. His character rises and falls in public estimation in proportion to the acknowledged honesty and uprightness of his dealings; and although he may, for a period, be apparently successful in a career of fraud and chicanery, the effect of such success is but to accelerate and render more signal his final ruin and disgrace. While there may be some departments of business in which strict moral integrity forms no essential ingredient of character, there are others in which it is altogether indispensable—as in banking institutions. Here great regularity and attention must be combined with sterling honesty and integrity; and it is accordingly among the men composing this class of society that these virtues are to be found most extensively and most strongly displayed. Here it is that we find men most thoroughly acquainted with all the business transactions, and often with the private arrangements, of their fellow-men; whose lips are as completely sealed as if they were in the most profound ignorance; who have daily and hourly passing through their hands hundreds and thousands of pounds—the gain, or capital, or industry of others—without exciting one covetous or dishonest thought, even although, as is too much the case, they themselves enjoy but a bare competency. These are virtues that elevate and adorn human nature, while they are, at the same time, indispensable to the welfare and order of society.

'In addition to regularity and attention, and strict moral integrity, the possession of business habits implies also the possession of a certain mental aptitude for conducting business. There are, it is true, some departments of business that may be discharged by persons of very small mental endowment, whose work is comparatively that of machinery, where all that is required is simply attention, and the exercise of their pen. Men are found employed by hundreds all over the kingdom, whose occupation requires no mental exertion whatever—who are to be found at their places every day as regularly as the striking of the clock—whose office attendance is punctual to a moment; but whose minds are free from all care and anxiety as regards the working out of results, and who, in fact, undergo no mental labour to affect them. Yet they are all men of strict business habits, without whose close attention and regular service, mechanical though it be, the affairs of the world could not be carried on.

'From those who are intrusted with the higher departments of business, however—who have the management and conducting of establishments—there is at once required and displayed a higher order of mind, or at least a greater development and exercise of the mental faculties. * * The chief intellectual qualities that ought to accompany good business habits are, a sound understanding, quick perception, prompt decision, and firmness in execution. The two latter are qualities which every man must practise and improve for himself; the former are natural endowments, which men do not possess in common—which are strong or weak in different men, but capable of being more or less strengthened and improved by all.

'There are great varieties of character and disposition among men of business, as well as great variety of natural and acquired talent; yet all may be men of good business habits. Some men are quick, bustling, restless—always on the fidget—rash, and precipitate; and are, in consequence, frequently getting into false and difficult positions. Others

* The Bankers' Magazine; Journal of the Money Market, and Railway Digest. Published monthly. London: Groombridge and Sons.

are slow, cautious, suspicious, hesitating, and in constant fear and anxiety as to the effects and probabilities of their acts. Some are dull, heavy, slow of perception, yet circumspect and judicious; others are quick of comprehension, energetic, and decided. It is impossible to say what description of character or disposition is most to be recommended or approved; because it is often found that men of a particular character will succeed to admiration in a position for which our previous knowledge would leave us to consider them unfit; while others, whom we should have deemed the very best adapted to certain situations, are found to be singularly unsuccessful and unfortunate in them. That aptitude which men exhibit for different departments of business, is what they either possess naturally, or what they have acquired by a regular course of training. The reason why one man succeeds better than another in a particular situation, is no doubt, in plain language, that he is better fitted for it; not that he is a better man of business—for, in point of fact, there may be a very great difference in the degree of their business qualifications, and even in the rectitude and integrity of their respective characters—but simply because his qualifications and disposition are of the description best suited for that particular place. A man with talents and qualifications eminently adapted to discharge the duties of a particular business, will not succeed in one place, just because his character does not sufficiently harmonise with that of others by whom he is surrounded, or necessarily brought into contact; but another man of inferior talents will succeed to admiration; and the reason is, just because his ideas and disposition are more in unison with those around him. Still, the general requisites of a man of business, the possession of business habits, however these individual cases may vary in quality and degree, are indispensable to qualify every man to enter upon, and succeed in, the pursuits of business.

'To these may be added the cultivation of a pleasant and agreeable manner. Much of a man's success in the world will depend upon his manner. There is nothing that creates a more unfavourable impression than a rude, hasty, imperious, or uncourteous manner. A silent, reserved, haughty disposition, when combined with good moral character, may in some instances obtain for a man the character of wisdom, but in general it does not gain him friends. A man who is courteous and obliging in his manner, will always conciliate more favour than one who is sullen or reserved, although the former may really be possessed of very little wisdom in comparison with the latter. The nearer men approach to free and unreserved intercourse with each other, the more smoothly the affairs of life appear to move forward. It is a law of our nature, that the more agreeable we are, the more gratification we experience. This we find demonstrated in our daily intercourse with the world, and it is therefore of immense importance to a man of business that, in addition to his other qualifications, he should study to acquire an agreeable and conciliatory manner.

'It is an old remark, but by no means a just one, that a man who wishes to succeed in any department should devote himself to that alone; that it is impossible for a person to attend successfully to more callings than one. Thus, in respect to business, it is said a man should devote himself exclusively to that; and that if he does so, he can have no time, or at least ought not to have any, to occupy his mind with anything else. Others, again, assume that a man of business, from the very nature of the training which his mind receives, is unfit for anything else. He becomes either a sort of machine, that can simply write and cast up figures and accounts, and who has no prospect or aspiration beyond that occupation, or his mind runs so much in one current—is so cramped, circumscribed, and tied down to the counter and the desk—that the moment he engages in anything else, he becomes unfitted for his own particular and original occupation.

'It is not difficult to perceive that these objections are not based on truth, and cannot be borne out by facts. It is true that a large majority of our young men are apprenticed to the desk, or chained to the oar of business, at a very early age, before they have received any proper general education, and are thus in a great degree deprived of the means of instruction. They have few opportunities of improving their minds, of increasing their knowledge, and of cultivating an acquaintance with the arts and sciences; and they fall into a sort of habitual routine of thought and occupation, caring for nothing beyond the observance of those daily duties from which they derive the means of subsistence. Yet there are many bright exceptions to this rule. Many of the most eminent men in literature and science have sprung from among men of business—have, in fact, been men of excellent business habits. No doubt the possession of mere business habits imposes a regularity and restraint, a certain uniformity and preciseness upon the outward conduct, which may to some extent induce a corresponding habit of thought and feeling. But this will not impair nor destroy the intellectual capacity, however much it may favour a narrow, and even dogmatical train of thought. On the contrary, it can be readily understood how a man of regular and ordinary habits, of a correct and perfect knowledge of business, must, from these very circumstances, be better fitted than most other classes of men for distinguishing himself in literature and science. His mode of thinking will partake more or less of that systematic and orderly character which distinguishes his business avocations. He will be more inclined to aim at clear and distinct views, and to resolve his ideas into practical and useful topics. If he does soar into the region of fiction or romance, his sketches, his pictures will be clear, vivid, tangible, and he will not readily do violence to reason or common sense.

'This leads to the observation which is sometimes met with, that a literary man can never be a good man of business; but it is an observation not founded in fact, and is refuted by daily experience. Mental superiority is at all times a source of jealousy to weak and vulgar minds. Nothing harmonises more with their natural disposition, than to detract from, and endeavour to destroy, intellectual merit. All men of superior intellect, or of great abilities, are the envy and scorn of the small fishes who are obliged to follow in their wake. These sentiments are either expressed openly, or conveyed in covert insinuation, or brought into exercise by endeavours to disappoint, thwart, or ruin their object.

'It is a fact amply verified by numerous illustrious examples, alive and dead, that great literary and scientific abilities may be combined with excellent, nay, superior business habits. Some distinguished men of business of the present day are men who also rank high in the world of letters. All men will be disposed to admit, that the greater the degree of intelligence possessed by any individual, the more useful he is likely to become to himself and others. When we engage a clerk or apprentice, for instance, we prefer a youth who is active and intelligent to one who is ignorant and stupid. The higher the degree of intellectual ability and personal address he displays, the more we appreciate the extent of usefulness he is capable of rendering. The same principle holds good in all higher departments. The intelligent apprentice becomes, in the course of time, the learned and enlightened merchant, banker, barrister, legislator, judge, or lord chancellor. His enlarged knowledge, his cultivated and refined understanding, do not impair, but still farther extend and render more illustrious, his capacity for business. His great distinction is at length the just reward of the cultivation and improvement of his natural abilities; and however much it may excite the envy, can never incur the displeasure of any but the weakest and most frivolous of men.'

ARTESIAN WELLS IN LONDON.

During the late session of parliament, the bishop of London, while advocating the necessity for the building of new churches in the metropolis, stated that its population increased at the rate of 30,000 annually; an increase that requires a proportionate multiplication of all that contributes to the comforts and conveniences of life. Greater quantities of food and clothing will be wanted every year; more houses, involving the extension of streets and thoroughfares; and, above all, a greater supply of water, to quench the thirst of the additional number of throats, as well as to lay an ever-widening surface of dust. It is to be hoped that the new scheme for the erection and working of public fountains will be continued and extended until London may be as usefully embellished with *jets d'eau* as continental cities, of which they are generally considered the chief ornament. The initiative, as is pretty well known, has been taken by the formation of two foun-

tains, with large basins, in Trafalgar Square; the water for which, instead of being supplied from any of the numerous companies, was obtained by boring, or the formation of Artesian wells.

In June last, Mr Faraday delivered a lecture at the Royal Institution on the subject of these wells, in which he explained and illustrated the practical details of the boring, and showed that the London public must look to the accumulations of water underlying the London clay for their chief supply of the pure element, for drinking and other domestic uses. In inquiring into the geological relations of the waters lying deeply below the surface, he described the soil upon which London is situated as particularly favourable to the realisation of this means of raising water. It is composed, in going from above downwards, of a layer of gravel of moderate thickness; then an enormous bed of plastic clay, known, in geology, under the name of London clay; beneath which lie calcareous marls, gravel, sand, and freestone, succeeded by massive strata of chalk; the whole thickness, from the surface to the chalk, varying from 200 to 300 feet. It was further explained that, wherever the sand and chalk crop out, or rise to the surface, they must absorb the water which falls in those parts. This water percolates downwards underneath the clay, and, finding no mode of escape, accumulates in the fissures of the chalk, ready to rush upwards through any opening which may present itself.

'The property of water to seek a level when it has descended between strata concave upwards, or between inclined beds of stratified rock, naturally accounts for the success of the Artesian operation. If two basins be supposed different strata, placed one within another, a little distance apart, and water be poured between, and a small hole be made in the bottom of the inner basin, the water will rise in a jet a very considerable height, and exemplify the nature of these springs, and multiplying the basins would afford an idea of those different springs found at varying depths, and of equally varying qualities. If, instead of the concave form, the plane of the strata be supposed to dip, the water, seeking the lowest point, and pressed by that which is nearer the surface, would equally rise, and form the Artesian well or spring, if the strata were perforated at their lower level.'*

The general mode of constructing an Artesian well is by first digging and bricking round to a certain depth, dependent on the nature of the soil, as in an ordinary well; from the bottom of this the boring into the lower strata of sand and chalk is commenced. In order to prevent the flow of any water into the opening, except that from these particular strata, the bore is lined with iron tubes, which completely shut out all percolations except that from the main source. Two borings were sunk for the works in Trafalgar Square—one of which is in front of the National Gallery, the other in Orange Street, immediately in the rear, both being connected by a tunnel formed of brick laid in cement, 6 feet in diameter and 330 feet in length. The boring for the deepest well penetrated to a depth of 395 feet, the lower portion of which, passing into the chalk 135 feet, is not lined with tubes.†

A contract was next made with Messrs Easton and Amos, who furnished the plans and constructed the works—engine-house, tanks, and cisterns in Orange Street—by which they agreed to work the engines for ten hours every day, supplying 100 gallons of water per minute to the Barracks, National Gallery, Office of Woods and Forests, Admiralty, Horse Guards, Treasury, Scotland Yard Offices, Whitehall Yard Offices, India Board, Downing Street, and Houses of Parliament, in addition to 500 gallons per minute to the fountains in the square, for the sum of L.500 per annum; being just half the sum previously paid to the water companies who supplied those departments. The whole expense for sinking the wells, erecting the engine-house, laying down the mains and the pipes to the fountains, was not quite L.9000. The water of the fountains is constantly running the same round of duty, being pumped out as fast as it returns from the basins: the supply of 100 gallons per minute is obtained from the deepest well, which, at the end of the ten hours, is not lowered more than five feet under the rest level. With a little more power in the machinery, the contractors are satisfied that the supply might be increased to five times the present quantity.

Not only has an important economical advantage been gained, but the quality of the water is far superior to that supplied for the consumption of the inhabitants generally. The presence of an alkali is shown, by its turning red cabbage-water blue; a reaction due to the carbonate of soda, of which it contains a notable quantity, from 16 to 24 per cent. of the total proportion of saline matter held in suspension. Mr Faraday found 41·5 grains of solid matter, among which was a small portion of lime, on evaporating a gallon of the water. The excess of soda renders it extremely soft, and particularly useful for domestic purposes. It is at the same time very agreeable to the taste. This success, and the certitude which the known natural constitution of the soil affords for procuring the same quantity of water, and in as great abundance as may be desired, in all quarters of the capital, has given rise to the idea of carrying out the practice either by new independent companies, or by concurrence with those already existing, wherever a sufficient number of consumers may be found willing to contribute to the expense.

Professor Faraday stated that the water rent of 2000 houses would suffice for the practical carrying out of the plan, inclusive of the ornamental addition, already alluded to, of a public fountain. In Berkeley Square a well has been sunk, from which water is lifted by a hand-pump, for the use of the inhabitants of that fashionable locality; but it was shown that an outlay of L.3500 in the necessary machinery, &c. would have produced a supply of water for L.350 annually, which now costs L.700, without a fountain, that might have been embraced in the other scheme.

Considering the rapid spread of London, and the eagerness with which new business enterprises are seized upon, it is not improbable that Artesian wells may become common, and thus give to the metropolis what its inhabitants so much require—pure water. The idea is not altogether new, for it appears that 'an endeavour was made in 1834–5 to form a "Metropolis Pure Soft Spring-Water Company," to supply the existing companies with their requisite quantities by Artesian wells of great magnitude; which failed rather through defects in the provisional committee, than through any demonstrated impracticability in their views, which had been entertained ten years previously, and formed the subject of an unsuccessful company in 1825.'* A remarkable objection has been made to these undertakings, which can only be explained by the prevailing ignorance of the principles of their action. It was said that they would soon drain the wells sunk in the London clay, which can only give back the water gained from the surface; while the Artesian wells derive their supplies from the chalk, where there is not the slightest communication with the clay. Such was the prejudice in this particular, that a formal complaint was instituted against the new well of Trafalgar Square while in course of boring, as having drained the neighbouring wells, even before it had yielded a single drop of water.

After his able exposition, Mr Faraday exhibited a simple apparatus, designed to demonstrate a new property of the *fluid vein*. It is well known that water, in escaping from an orifice of any form, does not long retain that form, but varies with more or less of irregularity: this is called the *contraction* of the *vein*. It occurred to the inventor of the apparatus that this contraction would be accompanied by a diminution of volume, which would consequently determine, in a close vessel, a diminution of pressure sufficient to cause a smaller column of water to rise from below, under the ordinary pressure of the atmosphere. To effect this, water is made to descend in a tube opening into a glazed box, in communication, by means of another tube, with a reservoir of water below. As soon as the valve which prevents the descent of the water is opened, the stream rushes into the box, contracts, produces a certain vacuum, when it is immediately seen that the water from below, which was coloured, to render the experiment more striking, ascends, and mingling with the descending column, flows out with it through the escape-tube. The

* Encyclopedia Metropolitana, vol. xxv. p. 1183.

† The well sunk three years since at Grenelle, near Paris, is 1800 feet in depth, and throws up 150,000 gallons of water every twenty-four hours.

* Journal, Statistical Society, vol. viii. p. 139.

lecturer stated, in conclusion, that, from the result of his experiments, it was probable that the principle might, in certain cases, be economically applied to practical purposes.

AN IRISH PIG-FAIR.

[*From the Daily News.*]

In order to enter into the scene of an Irish pig-fair with the proper spirit, it is requisite that the reader, besides encouraging a mirthful disposition, and a love for the study of character, should possess a duly-instructed mind on certain precursory principles and facts of the subject now proposed to be treated. It will therefore be necessary to offer a few remarks on the character and the circumstances which have combined to form and establish the character of an Irish pig.

Born in the warmest nook of the peasant's domestic circle—in the very bosom of his family, we may say—an Irish pig begins life under the most flattering circumstances which could be imagined. He may, indeed, be said to suck flattery with his mother's milk. His bringing-up hath a smack of royalty in it. As everything within the immediate range of his experience is made subservient to him, both in respect of his needs and his humours, he naturally and inevitably comes to the conclusion that he is the most important person in existence, and that the world was made for his use. His mother was reared amidst the same illusory impressions. The whole object of the family he lives with is to fatten him, and do him honour. In fact, honour and fat react upon each other, and he is crowned with favour in proportion to his obese demonstrations of having been graciously pleased to receive the offerings of his humble servants. . . .

The pig takes his meals with the rest of the family, whom, at best, he regards as his poor relations. He sits down with the circle of the family board (often, literally, a board for a plate), and eats with them from the same dish, from which they usually select for him the largest potatoes. Instances, it is true, have been known where a disloyal peasant has endeavoured to persuade the pig to eat a few potato-peelings mashed up with the rest; but seldom with success. Far more common is it to give the pig something in addition—such as porridge, bran and cake, and cabbage. Not merely is the pig better fed than the peasant, with his wife and children, but in several districts it is the only animal that is sufficiently fed. This is more especially the case in Sligo and Roscommon. The pig, meantime, knows how matters stand, and is quite aware of his own importance. If he happens to be coming in at the door of the cabin at the same time that one of the children is coming out, he tries to make it appear that there is not room enough for both, and gives the child a hunch with his shoulder in passing, like a surly brute who would growl, 'Get out of the way—don't you see *me* coming!' A traveller in the provinces told me that he once overheard a sort of dialogue between a peasant girl and the pig of the house. The pig had absconded, or at least had not returned all night; and the girl, who had been out searching for him since daybreak, was now bringing him home, reproaching him with his ingratitude as they walked along—the pig returning a sort of grudging acquiescence to each touching interrogatory. 'Didn't I always get you enough straw at night to cover round you, and a wisp to stick in the chink o' the wall to keep the wind out?' *Ouff*, said the pig. 'Haven't I given you the best praties, and leaves, and warm mash, and often gone without a meal myself for you—eh, now?' *Ouff*, said the pig; but the grudging acquiescence did in some degree partake of an 'Oh, don't bother *me*.' 'And wouldn't I always do my duty by you—eh?—wouldn't I? How could you have the heart to leave your own home—eh? Will I tell you of all your ingratitude, eh?' *Ouff*, said the pig; meaning in this case, 'Well, I don't care if I *do* hear about that.'

What should an education like this produce? What could be expected from such circumstances surrounding a creature from its birth? What should all this incessant pampering of body and mind produce in the character of the individual? I speak it with regret in the present case—what but a brutal, gross, morose, selfish hog!

Now then imagine, oh, reader!—if, after what has been said, thou canst imagine such a thing—that the day at length arrives when this pampered pig has to be taken to the fair, whether he is graciously pleased or not, there to be criticised and sold! Yes; the right honourable gentleman 'who pays the rent' has to walk, perhaps for several miles, with a certain indignity round one of his hind legs; and the disloyal, false knave, his owner, urging him, after divers base expedients, from behind or laterally, on the highway, to a public mart—there to be weighed, pinched, or fumbled all over, and then sold!—to what 'end,' let the classic muse of pie and sausage, pot, oven, iron-spit, or brine-tub, in fitting verse recite. . . .

The fair is held usually in the ordinary market-place, being in itself no more than a market, except from the dignity and importance, and, we may add, contumacious excitement of the chief thing sold. There are a few poor stalls for the huckster or pedlar trade; one gambling turn-about with halfpenny stakes; a little stage on a cart for the hoaxing sale of good-for-nothing haberdashery; no shows of any kind, no toys, and only three most unattractive stalls for stale-looking cakes and commonplace gingerbread with no gilt upon it, nor even the shining brown varnish which is the only admissible substitute. The fair is devoted to higher purposes.

We have seen the pig in his domestic circle, and have come to a right understanding of his inevitable character—the pampered creature of circumstances. From his earliest infancy he was the heir-apparent of the grossest egotism, selfishness, and ignorance. Now, let the reader of this historical, philosophical, severe, yet not unloving sketch, imagine himself, if he can venture such a thing, in the midst of three or four hundred pigs like these! Three or four hundred outraged country nobles, partly driven, and partly seduced away from their cabins, vassals, and baronial bogs, and here assembled in public. Be it understood they are not in a drove, not under any discipline, not in any degree even of swine-herd order. No man dares to exercise his whip; nothing but a thin, playful, smooth switch occasionally. And as for dogs!—I should like to see a dog show his face among nobility, and under exasperating circumstances: he would be torn to pieces, and trampled into mud before their wrath. They are not here, in any sense, 'a drove' nor a 'herd,' but each one asserts his own individual state of mind and passion. This may be defined as a state of equal indignation, rage, and the worst suspicions all fusing together. The pigs have found out that some mischief is intended to them! They have, in their brusque way, laid their heads together by threes and fours, and the conviction has spread among them. They have literally become wild beasts, and like wild beasts do they behave. They snarl, and squeak, and scream, and yell, and growl, and utter curses, and gnash, and foam at the mouth, and bite, and brawl, and rush, snout-foremost, under the wheels of carts, or between the most crowded legs of men. They are brought back in vain; for they struggle, and shriek, and gnash, and burst away; and when two by accident meet suddenly face to face, they seek instant relief of their feelings by a fight, to which they stand up in lion-and-unicorn fashion. While thus they gnash and bite, behind each one you see an excited peasant, embracing the loins of his warlike pork, in anguish lest the price should be lowered in the buyer's eye by the unseemly disfigurements of battle. . . .

But who are the buyers of all these alarming pigs? Behold him standing there, with one hand in his pocket, the finger of the other hand pointing contemptuously at a very good pig. He has a short *dudeen* in his mouth, and smokes and speaks carelessly at the same time. Smoke issues with nearly all his words. The man who buys the pig has a knowing, satirical, purse-proud, knavish, remorseless face and air. He has, moreover, a tongue to match it—wily, would-be-witty, overbearing, false, unfeeling, and dishonest. He is evidently an agent in the matter, and gets a percentage. This makes a clever screw of him. It is not his own money he so vulgarly displays, to dazzle the eyes of poor Pat, and make him catch at the first offer, however inadequate, as it is sure to be, first or last—unless Pat happens to be very sharp indeed, which sometimes proves to be the case. In general, however, he has little chance with these buyers. The buyer makes his first offer, after sufficiently depreciating the pig. The peasant knows it is worth more, and refuses. A little haggling ensues, and the buyer venting yet further contempt on the pig in question, walks carelessly, scoffing and smoking, in an opposite direction, and immediately commences a negotiation touching other pigs. The buyers are manifestly in league with each other; so that although there is some competition, it is not fair competition; and the screw and pressure of a secret

monopoly of the market is at work. If the peasant does not accept the offer of the first bidder, the second bidder may offer less, and usually does. The peasant looks after the careless smoking screw who is now so busily engaged a little way off, affecting to have quite done with him. He looks—he begins to walk towards him—the buyer walks away—the peasant follows. Again he addresses him on the subject of his pig. In the end, the screw has him at his own price. Now and then, however, the poor peasant repents his first demand, and holds to it with melancholy firmness. He speaks in a sad voice. He knows the fair value of the pig, and asks it. He cannot obtain it; and yet he does so want to sell the pig.

The only 'fun of the fair' is the pig's invariable resistance to the examination of the buyer's hand, with the perversity of the buyer, after he is held fast, in persisting to feel those parts where he is least fat, instead of those parts which are most plump, and to which, with ludicrous anxiety and eloquence, the peasant in vain endeavours to direct the buyer's attention. Amidst this the pig often crouches close down to the ground, and screams with all his might. Perhaps, however, he may be docile from cunning, and some *finesse* in his mind, in which case he only holds down his head coyly. But generally he is in a rage, and has to be soothed and scratched, as he sits up on his haunches with a savage unappeasable countenance.

At length a bargain is made complete—a pig is sold. The buyer marks him with his especial mark—some mark with scissor-lines cut in the bristles, some with red ochre, some with black chalk—and ostentatiously displays money while paying, and talks of much more. A poor, little old woman in rags, and with a small, pale face, comes meekly to listen, and is attentive to the talk of all this money. She goes away very humbly, but seems all the better for what she has heard. A deplorable ballad-singer, more than half-naked, fills up any temporary diminution that may occur in the noise of the fair.

On the outskirts of the town, peasants are seen driving sold pigs to the buyers' carts or quarters. You may know to a certainty by the man's face and air if he has sold the pig according to his previous mind. Not often will you see a satisfied smile lurking round his mouth, but the corners drawn straight with disappointment, as he looks down reproachfully at the pig for having misbehaved himself at the fair—in not rendering himself docile to the buyer's fingers, and more entertaining in all his natural blandishments.

A fiddle sounds from a little coffee-shop in the fair. All the business then is done. There is a crowd yonder, at one side of the market-place, standing in a circle. Is it a fight—not of pigs, but men? What occasions the disturbance? No; it can be no fight—no disturbance; for everybody is standing quietly, and silently too; and there is one man who has a very sad face of sorrow and perplexity, as though he had lost something. Let us approach.

All is explained. Upon several planks and half a door lies some huge form, covered over with a large, coarse, white sheet. At one end, beyond the covering cloth, there appears a quiet hoof sticking out like a pointed moral; and at the other end the tip of a pale snout, with a crimson stain in the nostril, pathetically pokes forth. It is the Roman emperor who, a brief hour ago, sat with terrific countenance in the middle of the fair. A deed has been done. He has been bought and sold; but they could not lead him into captivity. The debt of nature is paid—so is the poor man's rent; and death and the landlord can now do what they like with their own. As for the fallen hero, let his faults die with him. There is nothing coarse in him now—nothing gross is here, in this scene before us—nothing selfish and brutish. All is hushed, philosophical and suggestive—refined by the hand of the universal steel-bearer, the quieter of us all.

GREAT GAINS.

If ever you hear a person boast of his having got any exorbitant advantage in his dealings, you may, generally speaking, conclude such a one not too rigorously honest. It is seldom that a great advantage is to be got, but there must be a great disadvantage on the other side; and whoever triumphs in his having got by another's loss, you may easily judge of his character.—*Buryh.*

SHOULD STUDY BE CONFINED TO ONE SUBJECT?

In a series of lectures on the study of German Literature, delivered at Manchester by Mr George Dawson of Birmingham, the following remarks (quoted from the *Manchester Examiner's* report) are made:—'Sometimes you heard men warning people against a dissipation of study, against studying too many things, and exhorting them to confine their attention to one thing. Now, up to a certain time, he considered that this was bad advice. He did not think that this should be the foundation of culture to those to whom literature was a secondary thing. They should in early life gather in a variety of knowledge—form, as it were, a good weft—and then inweave the particular study which after-life required should be the pattern on the cloth. For a literary man, he need not say how necessary total culture was. He had before protested against fractional studies, as contradistinguished from a subdivision of labour in teaching. To exhort people to cultivate one branch of knowledge to the exclusion of everything else, was like urging one man to direct his efforts solely to the strengthening of his right arm, another of his left, a third of his feet, and so on. One man recommended you to cultivate the exact sciences only, and hence society had been supplied with men who were mathematicians only—men whose gospel was a right angle, and whose religion was a circle. In other cases, men had become so engrossed with a particular study, that they would spend an enormous amount of time in settling the quantity of a Greek syllable, and write most elaborate treatises on the Greek digamma. A fully-cultured man could turn his attention to anything; and, when fully cultured, he should turn to the division of labour which stern necessity imposed upon him. Sometimes, however, natural propensity would come in to check this. Nevertheless, we should all aim at what the Germans called "many-sidedness;" so that, whichever way we turned, there might be a polished side presented.'

RUSSIAN SOUP.

Now that we have fallen on the subject of national tastes, we must not forget to describe the most atrocious compound ever presented to man in the shape of food. It is the Russian soup called 'Batinia,' which to English palates tastes worse than poison; but which these our allies, high and low of them, delight in as the greatest delicacy on earth. Hearing so much in its praise, we ventured once, and once only—for there is no fear of its being asked for a second time—to give a hint that we should like to make a trial of it. But ('*O dura Russorum ilia!*') the taste is not yet away from our lips, nor are we yet persuaded that the skin has returned to our throats. A plate of this yellow liquid—it ought not to be called 'soup'—was placed before us, with a scum on its top something like a thin coating of sulphur. Adventurously diving through this surface, what did we discover? Lumps of rotten sturgeon, slices of bitter cucumber, spoonfuls of biting mustard—in short, a concatenation of all the most putrid, most acrid, most villanous substances that nature produces. The witches' broth was nothing to it—

> Eye of newt, and toe of frog,
> Wing of bat, and tongue of dog,

would be delicacies most exquisite compared with these Russian horrors. But though both smell and sight were well-nigh daunted, we resolved to persevere like men. We had begun the perilous adventure, and could not with honour draw back before taste had also been put to the test. A spoonful of it was accordingly raised to the lips; when lo! besides other recommendations, it was found to be literally as cold as ice; for the mountain projecting above the surface, which we had innocently supposed to be some nice redeeming jelly of Russian invention, turned out to be a lump of ice from the 'frosty Caucasus,' or some other vile place. That mouthful was the worst we ever swallowed. It would be impossible to depict the looks of anguish which we—a party of deluded and inexperienced Englishmen—cast on each other. It took away the breath; tears rolled from our eyes; we were more than satisfied—we were humbled, silenced, overcome; and made a vow, before the whole company of strangers, never more to be lured into an attempt to make new discoveries in the adventurous region of Russian dishes.—*Brenner's Excursions.*

No. 126. New Series. SATURDAY, MAY 30, 1846. Price 1½d.

'LA PATRIE.'

'*The People*,' a small work by M. Michelet, is likely to become well known amongst us, since two translations of it have already appeared. It is full of the most singular egotisms both as to the author and the author's country—worth reading, for the stirring and occasionally fine thoughts scattered through it; yet, on the whole, of a mischievous character. We should not have thought of mentioning M. Michelet or his book, but for its extravagant samples of the sentiment called Love of Country. Had any one wished to caricature this sentiment, he could hardly have employed more suitable terms than this clever French historian. We find him, for instance, proclaiming that nationality is 'the life of the world—without which all would be dead:' nationality is only now come to a true maturity in France and England, on the provincial nationalities ceasing to exist. The feeling of native country is the last to die. 'I have found it,' says he, 'in the dead!' Amongst the most depraved, there was always one moral spark surviving—it was France! 'France,' in short, 'is a religion!' One of the most essential parts of the education of a young Frenchman is this:—On a great public festival, his father 'takes him from Notre Dame to the Louvre, the Tuileries, the Triumphal Arch. From some roof or terrace he shows him the people, *the army passing, the bayonets clashing and glittering, and the tricoloured flag*. In the moments of expectation especially, before the fête, by the fantastic reflections of the illumination, in that awful silence which suddenly takes place in that dark ocean of people, he stoops towards him, and says, "There, my son; look, *there is France*—there is your native country! All this is like one man—one soul, one heart. They would all die for one; and each man ought also to live and die for all. Those men passing yonder, who are armed, and now departing, are going away to fight for us. They leave here their father, their aged mother, who will want them. You will do the same. You will never forget that your mother is France." . . . It is truly grand for the Frenchman to have here the glorious and immortal *Patrie* gathered in one point, with all ages, all places together; and to follow from the *Thermes de César* to *the Colonne*, to the Louvre, to the Champ-de-Mars—from the *Arc de Triomphe* to the *Place de la Concorde*—the history of France and the world!'*

M. Michelet, in another part of his book, details symptoms of decline in France, and the embarrassed and distressed state of the various classes of people. He is full of fury at all other nations, as if any prosperity they enjoy were at her expense. 'Children, children, I say unto you'—so he bursts out—'climb up a mountain, provided it be high enough; look to the four winds, you will see nought but enemies!'

How comes it that one never hears a man speak high words about his native country, but bayonets and gunpowder are sure to be in the immediate neighbourhood? How comes it that this so-called affection should always betray itself chiefly in some bravadoing, defying, destruction-breathing language towards the other inhabitants of the earth? Why cannot a man love a certain piece of the geographical surface, except on the condition of his regarding all the unfortunate people who live elsewhere with a mixture of hatred and contempt? Or, why should there be such an association of ideas amongst us, that we are most disposed to think of our native country when we survey the ranks of her soldiery—the enginery which she forms in confession of either a desire to fall foul of other countries, or a dread of being fallen foul of by them? These are questions which I do not recollect ever seeing asked before; but it is not the less proper that they should be asked now. There is the more necessity, considering the esteem in which the sentiment stands in our moral codes, that we should at length challenge a thing of such ominous associations. For surely it is startling to find the people who are the most replete with this feeling, the first to acknowledge that all other peoples are their enemies. What is it, we must ask, that makes Frenchmen of the Michelet stamp regard their peaceable neighbours in this light? What can it be, but that they entertain selfish feelings about their own country, and consequently feel that others ought to regard *it* as an enemy?

The fact is, that though it may seem theoretically possible to entertain love of country as a pure and harmless feeling, it is seldom practically exemplified, except in connexion with some spirit of hatred towards other countries, or in a selfish regard to certain local interests. Sound it thoroughly, and it will usually be found not to consist of such a love for fatherland as one feels for a natural father, not a result merely of pleasant associations regarding a piece of ground which we have been familiar with since infancy, but an unreasoning prejudice, springing from the selfish propensities—a compound of self-esteem, acquisitiveness, and unmeaning odiums. It is not, therefore, wonderful that nations much under the influence of this spirit should wither, and feel cause to complain. They only suffer under the decree which has been passed in the councils of the Almighty against the centripetal or selfish spirit, under whatever form, or upon whatever scale, it may be manifested.

It would be well if, all over the earth, we were to come to the naked truth on this subject. That truth appears to be, that round the central point—the man himself—there is a series of concentric circles marking

* Cocks's Translation. Longmans, London.

his immediate family—his clan, town, or province—his country—which are liable to become objects of the selfish and exclusive affections in diminishing degrees: that is to say, he first loves his family against all other families; then he loves his clan or province against all other clans and provinces; finally, he loves his country against all other countries. In his general moral progress, or as he advances in civilisation, he passes from narrow to more spacious circles of partiality. It is something to see him sacrifice the family exclusivism to the clan exclusivism, or the love of his village; it is more to see him give up the clan, or village, or province exclusivism, for the more abstract and generous feeling in behalf of his country. Still, all are but grades in barbarism; for all of them indicate a merely instinctive acting, apart from both reason and the higher moral feelings. Does any one doubt this? Will he, then, adduce me a single instance not merely of one clansman being just in judgment towards another, but of a lover of his country even pretending to consider what was due to the people of another country—generously admitting their merits, entering kindly into their interests, and fulfilling towards them the great moral maxim, applicable to all the children of the earth, of doing in regard to them as he would be done by? Was there ever a Campbell of old conscientious to a Gordon, or a Tuscan to a Ferrarese? Forty years ago, when we heard more of love of country than we do now, was there a single Englishman disposed to admit that the French were exactly human beings like ourselves? Is it not invariably found, that just in proportion as this affection is warmly felt, so is there a blindness to the good that is in other countries and other peoples—a disrelish and hatred for these peoples—and, in extreme cases, a disposition to cut their throats? Now, surely if a thing be good, it should be presentable in the light of reason, and of the just and kindly feelings. But not one particle of reason, or conscientiousness, or true impartial and diffusive benevolence, was ever found in connexion with this sentiment in its ordinary forms. A man tells me, with the greatest complacency, I am for England against all the world; thinking, apparently, he is saying something extremely noble, when in reality he is only telling me that he would embrace or grasp an advantage for England to the injury of all other countries; that he would support it in any selfishness against other countries; that he would defend and support it in any error it might fall into against neighbouring states; and so forth. So it always is—always there is some horrible injustice, or antipathy, or butchery contemplated, when we hear of this same love of country. It has been seen in the universal rapine of Rome; in the grasping commercial policy of modern nations; in the endless, aimless, sanguinary wars of all times. *La Patrie* was the sanction of the atrocious policy of a Bonaparte. It is, in the case of France, the source of uneasy feeling to all Europe, and a reason for universal soldiering and fortifying at this day. Never do we hear of a noble act of generosity or justice between nation and nation in connexion with this sentiment. What pretension, then, can it have to the good esteem in which it is usually held? Is it not, on the contrary, deserving of all the reprobation due to the selfish and outrageous acts to which it habitually gives rise? And would it not everywhere receive this reprobation, if there were a sufficient number exempt from its guilt to form a pure tribunal for its arraignment?

It will not, however, be so always; but precisely as men have been able to conquer the partiality for the name of Macpherson as against that of Mackenzie, or for the province of Wales as against England, will they be in time able to feel at one with a people called the French, or a state called Russia. They will find it possible to tread the beautiful land they live in, rejoicing in all that is goodly and of good report belonging to it, and solicitous to promote its true and righteous interests, without feeling one particle of jealousy or hatred towards any other country; but, on the contrary, eager also to promote the interests, and make handsome admission of the deservings, of all the neighbouring portions of the great family of man. It will then be discovered that, even as the individual, so may the collective unity called a nation, best seek happiness by endeavouring to promote it in others; true joy being ever a reflected light. It will be found that one commercial kindness thrown out to a neighbour, even at what may appear a sacrifice of immediate interests, will give ten times more safety than twenty times the equivalent in money spent in that loathsome barbarism of our age—Armed Precaution. International civilities will be as common as civilities between neighbours in a street, and will be as effectual in promoting peace and good-will. Then it will become as great an absurdity to think of war between England and France, as it would now be to think of it taking place between Yorkshire and Durham. Such and so mighty must be the effects of our passing in moral development from the narrow circles in which we still confine our affections, to that wider sweep and range which it is part of our professed religion to hold as realisable, and without which being attained, indeed, our religion can never be considered as in full practical operation. May the day of all these blessed experiences be at hand!

THE WORK-GIRL.

Work!—what extremes in human life are suggested by this little monosyllable! What varied interpretations may be placed on this one short word! And how differently is it considered in each circle through which we might trace its universal application, from the light and elegant occupation of affluence, downwards to the toilsome drudgery of necessity! One picture gives us the fair and accomplished daughters of our land seated before their embroidery-frames, surrounded by colours as bright as the rainbow's hues—worsted, and silk, and golden threads, scattered in rich profusion, with every accessory to interest and amuse; but before the leaf, or the flower, or the cunning device is half copied on the canvas, some anxious parent or careful friend will approach, and in tones of fond intreaty request they will lay it aside, lest the graceful figure should be injured, or the radiant eyes made dim, by work! And this, again, is the term to designate the employment that has hollowed the cheek and chilled the life-blood of the weary occupants of many a solitary garret, who, sighing, listen to the midnight chime, and think that even then they cannot lay it by to rest. Such are the extremes. Would that neither boundary was so strongly marked, and that a little habitual self-denial in the one instance, might afford means to lessen the privations of the other! When Lord Collingwood wrote home, enjoining his wife to inspire his daughters with 'a contempt for vanity and embroidery,' it might almost be imagined that the gallant admiral had a prophetic glimpse of the expenditure of time and money lavished by the present generation on this fascinating pursuit. But it is the abuse, not the use of anything which renders it reprehensible; and we may remember it was a saying of the sagacious Dr Johnson, that many a man might have escaped hanging, had he known how to hem a pocket-handkerchief. Let our fair countrywomen, then, enjoy this recreation as a recreation, not as an all-engrossing pursuit; and let us all, both men and women, feel thankful that the needle has provided an antidote

against listlessness in one class, and a means of livelihood for another.

A lady was lately making some purchases in the principal shop of a little sea-side village in the south of Ireland. As usual, it was a place where the most incongruous articles were collected, and, accordingly, frequented by purchasers as different as there were varieties in the inhabitants of the village; besides which, on the weekly market-day, it was so crowded from morning till night by an influx of country customers, as to render it a matter of some difficulty to reach the counter. The lady, however, was a person of some importance, and way was made for her as soon as she appeared, while the obsequious shopman threw everything else aside to attend to her commands. They were not very important; and having soon despatched them, she was waiting for the change of a note, when she became aware of a gentle pulling at the back of her dress, two or three times repeated, and so far different from the occasionally rude pressure of the crowd, as at last to attract her attention. She turned, and saw two young girls immediately behind her, both of whom coloured deeply as she looked round: one, very small and delicate-looking, drew back timidly; but the other, a tall, handsome girl, raised her eyes ingenuously, though respectfully, to those of the lady, and in gentle accents apologised for the liberty they had taken. 'But my sister, ma'am,' added she, 'is very sickly, and her only pleasure is in work; and when she saw the trimming on your dress, she thought it so pretty, that I could not help drawing it a little nearer for her to see.'

Before she had concluded the sentence, her companion had again glided forward, her dark eyes glistening, and slipping her hand into that of her courageous defender, added earnestly, 'Forgive us *both*, ma'am.' The lady, whom we shall call Mrs Villars, much struck by the little scene, reassured them speedily with one of her own sweet smiles, and stooping down, unclasped her mantle, and showed them, to their hearts' content, the dress they had admired so much; then gathering up her little purchases, she returned their energetic gratitude and admiration with another smile, and left the shop.

Days passed away, and she saw the sisters no more; but they often returned to her thoughts, and, unblessed by any similar tie, she would remember with a sigh the strong affection revealed by that little incident. In one moment it had told its own story—of fond protection on the one side, and grateful reliance on the other—as intelligibly as if the parties had been known for years; and she marvelled that, in a class where, from want of mental cultivation, externals must seem so important, such superior personal attractions as one sister enjoyed, should create no taint of vanity or of jealousy to sully their mutual love. But Mrs Villars reasoned wrong. She had yet to learn that the heart teaches its own lesson—the most unsophisticated often the warmest; and that true affection is a sunbeam that blinds our eyes to the deficiencies of the beloved ones, while it casts a ray of tenfold brightness on every excellence they possess.

At last one morning, in an early walk more extended than usual, she came to a cluster of cottages near the shore, at some distance from the village. It was a pleasant, animated scene, and Mrs Villars stopped to admire the eager groups collected round some boats returned from the night's fishing, and either making bargains for themselves, or congratulating their sons or husbands on their success. As she lingered, a young girl tripped lightly by with a basket on her arm; and even in that passing glance she could not mistake the bright eyes and glowing complexion of her late acquaintance. A look of recognition also beamed from those same eyes. Half hesitatingly she paused for an instant, then with a modest curtsey was passing on, when Mrs Villars accosted her, and, with an inquiry for her sister, joined her on her way.

During their walk, she learned that Ellen and Mary Roche were sisters, their mother long since dead, and their father—'Wisha, he was just nothing at all.' Mrs Villars had lived long enough in Ireland to know that the smothered sigh which followed that little hesitating sentence indicated a good-natured kind of idler, who smoked tobacco when he could get it, drank whisky on the same terms, and was a burthen to the family it was his duty to support. But how eagerly the speaker turned from that unwelcome theme, to dwell on the perfections of her sister Ellen! And as she did so, the varying cheek, the eyes sometimes smiling, sometimes tearful, and the occasionally tremulous tones, spoke in her own favour as eloquently as if Ellen had been there in turn to tell the tale, and more than that we need not say. Ellen was the eldest, though she looked so small; but an early accident had made her lame, and checked her growth; and in those days of suffering she had learned to use her needle with such skill, as to enable her to contribute materially to their livelihood now. 'She could never come with me, ma'am, when I went out to play with other girls, or follow me when I was clambering on the rocks, or picking shells on the shore; but she was always on the watch for me, as a mother looks for her child. I never found her missing from the door when I was coming home; and if, as sometimes happened, I forgot to be back in time, I saw the trouble in her pale cheeks and sad eyes, though she never said a word, so that made me careful not to wander any more. And she taught me to be tidy, ma'am; for I was very wild and careless, and would never have cared about tearing my clothes, only she always took and mended them, without ever noticing it; and she taught me to be gentle, and to curb my hasty spirit, for I saw her suffer pain and sorrow without murmur or complaint; and above all, ma'am,' and here the tearful eyes filled entirely, 'she taught me hope when my heart was sinking, and the power to bear when sorrow in earnest came——'

She stopped short, and drew her hand across her eyes; then looking archly into Mrs Villars's face, who, deeply interested, was quite unprepared for the sudden transition, she added gaily—'Here I am all the time praising myself—tidy, gentle, and strong-hearted! Oh, lady, they are all but feathers from that sweet dove's wing!'

As she spoke they approached a whitewashed cottage, poor, but neater than is usually seen. In place of the dunghill there was a narrow little strip of garden, paled off from the road, filled with gay flowers glowing brightly in the morning sun; and at the door, as Mary had just been telling, was Ellen, looking out for her with the watchful habit of their early days. A few quick steps forward, a whispered word from Mary, and Ellen turned to the lady with a pleased smile of recognition, and invited her in to rest. She gladly accepted the invitation; and soon found herself seated in the clean and tidy, though poorly-furnished dwelling. The only articles of superior comfort were a small work-table, placed near the window, and beside it a sort of easy-chair, made of straw, both evidently adapted to the occupation and infirmity of poor Ellen. Oh yes, we had nearly forgotten, the room was not quite unornamented either; for over the fireplace was arranged a large piece of coral, and some foreign shells, and near the window hung a cage, in which was a bird with brilliant plumage, all telling plainly of some friend from over the sea.

Mrs Villars had at this time the good fortune to escape an interview with the good-for-nothing father, and had the pleasure of talking, without interruption, to the two young girls, so different, and yet so united. This interview was succeeded by many others. Ellen was supplied with as much work as she could accomplish; and Mary, who, under her instructions, had also become

very expert at her needle, would hasten with double diligence through her more active employments, that she might gain some time to share in the occupation of her sister. And sweet it was to see those two young creatures seated, with busy fingers, at their work on the quiet summer's eve; Ellen earnestly dwelling on some instructive lesson, while, with deferential gentleness, Mary would raise her loving eyes now and then, in silent assurance that the words were going home to her heart; or, in turn, those eyes would sparkle gaily, and a happy smile would brighten Ellen's graver face as she listened to some passing jest or merry narrative from her light-hearted Mary. But were they always thus alone? We reckon the father as nothing; for, with his hands in his pockets, he lounged in the sunshine while sunshine lasted, and then took his supper, and went off early to bed. He had his cottage and a little plot of ground rent free for his own life, and, caring only for himself, considered any exertion for a future provision quite superfluous. Even so: the girls had another companion who would often, as Ellen would say, come in 'to idle them' in the evening; sometimes to make them laugh and talk—sometimes to read while they worked—and, oftener still, when the sun was sinking low, and the evening waves curling gently towards the shore, to coax them to 'lay aside their stitchery,' and saunter with him for half an hour along the cliffs. Notwithstanding the difference in their station, Mrs Villars was soon regarded as a friend by those two motherless girls, and each meeting increased the interest she felt in them. She had given them employment and encouragement, and, more welcome still, had on more than one occasion given them affectionate sympathy and advice; but still she observed that at times some cloud was hanging over them, heavier even than poverty, and she determined not to conclude her visit to the sea-side without, if possible, winning their entire confidence, and making some effort for their happiness.

One morning Ellen was alone in the cottage, when Mrs Villars entered with a small parcel in her hand, and asked her gaily, 'Well, Ellen, would you like to make your fortune at once?' Ellen returned her smile with one as gay; but in an instant the bright expression vanished, and clasping her hands tightly, while her delicate figure actually trembled with emotion, she answered earnestly, 'Would I wish to make my fortune? Oh, lady, I would give all the work these poor hands can ever do while life is spared me, to make a fortune of ten guineas before another month passes by!' Then burying her quivering features in her hands, she sank back into the little chair from which she had just risen, and burst into tears. Mrs Villars, amazed at an agitation so unlike the usual placid and collected demeanour of Ellen, sat down beside her, and sought to comfort and calm her with tones even kinder than her words. For a while all would not do; but at last Ellen raised her head, hurriedly wiped away her tears, and putting back her hair with her still trembling hands, in faltering accents asked pardon for her foolishness; then, gaining confidence with the effort, she related, even as friend would tell to friend, the sorrow that was weighing on her heart.

She told what a young and helpless creature Mary was when they were left even worse than orphans; how she, older by a few years, was still older from suffering and much inward thought; and how, from that hour, she had taken the little darling to her heart, and resolved to fill a mother's place to her through life. Then she told how the task was more difficult, because her beauty won indulgence from every one, and how she feared to lose her love in the checks she found it needful to impose. 'But there was a deep mine of truth and sense in that seemingly thoughtless nature; and even in childish anger, she never forgot that I was her best and truest friend—even then her chief care was not to grieve me; and you know, ma'am, how she loves me now,' said Ellen, looking up with a glow of intense feeling; and reading her answer in the lady's eyes, she dropped her own as she softly murmured, 'Yes, even as I love her!'

There was a moment's pause; and then in lighter tones Ellen went on to say that even such love, perfect as it was, could not entirely satisfy a heart like Mary's; that she always knew the time must come when she should be contented with a sister's place; and instead of regret, felt proud and happy when she found that Mary's heart was gained by one who had loved her almost from childhood—the most dutiful son, the best-conducted and most industrious *boy* in the place. 'I rejoiced in their happiness, and I encouraged it,' continued she; 'little dreaming that I was building on the very sand. Garret Mahony was a sailor, and had been more than once abroad; but his father was grown old and infirm, and as he was the last of many children, he made him promise never to leave him again. So he had a good deal of idle time, except when out fishing, and those leisure hours were mostly spent in the company he loved best; while I, proud of my own sweet Mary, and seeing no one in the world to compare with her, never for one moment dreamt that any could look on her with other eyes. One evening Garret came in, and at the first glance I saw something was the matter. Happily, Mary was out; gone to carry home some work; and I was able to bear the first wild burst of his sorrow alone. But there was anger too, as well as sorrow; and though I had to bid my heart be still, that I might quiet his, yet it was the bitterest hour of my life.

'He told me that his father that morning had questioned him as to all the time he latterly spent here, and that, glad of the opening, he had at once avowed his love for Mary, and tried to speak of her as she well deserved: that his father had listened quietly until he was done, and after he was done, and then at last asked coldly what she had, along with what she was? This was a question that never had occurred to Garret; but he well knew there could be but one answer, and so he told his father, adding, that Mary was more precious than money or land. But the old man smiled, as some will do when they think young hearts have spoken in their folly, and he told his son the time would come when he would see with different eyes. Garret grew impatient, and was answering warmly, when his father silenced him, and, in a voice of command, desired him to attend. He is a proud and stern man, dear lady, old Maurice Mahony, and with a name for sense that has given him power over all that come within his shadow; so no wonder that his son listened with respect, though his heart was rebelling at every word. The father went on to say that he never knew any good come of marrying a girl that could bring nothing but herself, unless she met with one as badly off, and then they might pull on together; but as long as the husband had any income, the wife that never knew the value of money of her own would think there was no end to his, and would soon grow discontented when her wishes were refused. Then would come extravagance, then anger, then bitterness, then want; and no knowing how many more evils he would have added, only Garret's fiery countenance showed he could bear no further. He changed then so far as to say that this was not out of covetousness, for the day Garret married to please him, he would give him up his share in the hooker, and that was well worth twenty guineas; but that he expected his wife would bring at least as much again; and unless she did, they never should have his consent or blessing.

'Garret was cut to the heart. There was a show of reason in his father's words; but it was calculating, heartless reason; so, without pretending to answer it, he tried to touch his feelings; but all in vain. The old man was not to be shaken; and at last poor Garret, as he himself confessed, lost patience, temper, respect itself; and, in words which no child should have spoken, no parent could forgive, reproached his father with cruelty and covetousness, withdrew his promise of never leaving him, vowed to go to sea again, and, sink or swim, never to return till he could bring home an inde-

pendence for himself and Mary. Oh, lady, those words are few and cold to convey the feelings that were pouring like a torrent from his heart! All were mixed and struggling together—anger, disappointment, self-reproach, love for Mary, duty to his father; each feeling so true, and yet so opposing, my very heart bled for him, for her—for all. But before I could well picture the consequences, in came Mary herself, her sweet face glowing from her walk, and from pleasure at being home with me again. One glance, and Garret buried his face in his folded arms on the table; the smile and the colour fled from Mary's cheek, and, without even a look at me, she sprang forward, and grasping his shoulder, asked wildly what was the matter. I had thought to break this reverse to her myself, to spare him the telling, and her the hearing it from him: but, as I said, she came back before a plan was formed, and now there could be no disguise; his look had prepared her for the worst, and I saw by her terrified countenance that even the truth would be a relief.

'And so he told it all again; but this time, oh, how different! The presence of her he loved came like sweet dew upon his heart, and melted away all the fierce and stormy feelings which had made me doubly grieved. With touching, yet manly sorrow and repentance, he related his disappointment and his fault, and he told it to one whose generous nature fully felt his confidence, and lost the first sharp sting of grief in sympathy for the estrangement between the father and his son. She wept, without doubt, long and sadly; but her face was turned away, and she listened, without interrupting, from beginning to end. Then, when all was over, she raised her head; her face was very pale, and her lip trembled; but there was a light in her eyes, and a steadfast look, that made me remember the high, proud spirit of her childish days, and tremble for the words she was about to speak. I wronged her in that passing fear, even I that should have known her well. It was no pride, but a holy resolution that was shining in that earnest look. She laid her hand affectionately on Garret's arm, and in a very calm, low tone, asked him, "Did the old man say anything against *me*, Garret—against myself?" He gave her a look of surprise, almost of reproach, as he exclaimed, "Oh, Mary!" It was enough. A faint smile rested on her lip as her heart told her Garret felt such a thought impossible; and, after a moment's pause, she continued, "Then, Garret, our first thought must be of him. Go to him at once, and gain his pardon for that disrespect, and comfort his heart, even as you did mine, by the *goodness* of your sorrow. You will feel nothing but misery till you have his forgiveness; and think how he must be grieving now! Then, for the future, we are both very young, and may well wait, with trust in God and in each other, for the changes time may bring. Your father made no objection to me except for poverty, and as that is no real fault, who knows but he may change his mind."

'Garret shook his head despondingly as he answered, "Ah, Mary, you little know him; but I'll go at once and ask his forgiveness, for, as you truly say, I cannot have rest or peace until I do so. But as to remaining idle any longer at home, when gold is to be made, and happiness depends on it, it is out of the question, Mary! You must not ask me to do that."

"But indeed I do, Garret; that *is* what I ask you. You gave a promise to your old father, and you must not leave him. God always grants his blessing to the dutiful son; and would I be the one to tempt you to disobedience, and so provoke his curse? No, Garret; it surely is not *we* that wish for money; all we want is your father's consent; and that would be farther off than ever if you were to desert him, and make him look on me as the cause."

'Garret still remonstrated; but Mary's simple faith and sense of duty finally conquered so far as to gain his promise to wait one year; and then he declared impetuously that if his father by that time had not changed his mind, he would no longer yield to his unreasonable whims.

'Satisfied with averting the present evil, Mary urged him no farther then; but hurried him away, not to lose a moment in becoming reconciled to his father. Then, worn out with her long effort at composure, my poor girl threw herself into my arms, and wept without restraint her long-repressed and bitter tears. But Mary's heart is like an April day—sunshine ever following the showers; and after a while she raised her head, and with a cheerfulness that took me by surprise, exclaimed, "Well, Ellen, at any rate we shall not be parted; life will glide along the same as ever; and with hope to gladden, and the sense of doing right to bear us up, I think we ought to be even happier than before we were tried. And now from this time out," added she, with increasing liveliness, "I must be very careful, steady, and diligent, and so win a good character for old Maurice, as I have no money to buy one:" then sitting down to work with an air of diligence, she cried, "Now, Ellen, you'll have to bear witness in my favour, so here's to begin!"'

Ellen then told how, in the evening, Garret returned; but though his heart was evidently lightened by his father's forgiveness, still it was also plain that he had not recovered his own disappointment. His impetuous, active nature found waiting and submission a hard trial; and it required a double exertion of fortitude on Mary's part to make him hope against hope. It was also evident that no change had been wrought in old Maurice's determination: so, convinced that matters could not long continue in this state, Ellen inwardly determined to make an effort to bring about some understanding. And an effort indeed it was for her. Naturally timid, and rendered still more diffident by her infirmity and secluded life, nothing but the power of an affection which was the first object of her existence, a love stronger than death, could have induced her to take the step she now meditated. This was to obtain an interview herself with old Maurice, and with her own lips plead the cause so dear to her heart. She knew him, as she had said, by report to be a hard and stern man; but she had also always heard he was a sensible and a just one. She had heard, too, of his having, in early life, loved his wife to idolatry, and cherishing her memory with a constancy that would never allow him to replace her; this, combined with his genuine love for Garret, inspired her with the hope that his feelings might be touched by her appeal; and she resolved on making an attempt to convince him that arithmetic was not the only rule for measuring human hearts.

We need not enlarge upon this interview. Enough to say, that, though at first causing some surprise, she was received with civility and kindness, which gave her courage and even hope; and though she found it impossible to remove an opinion which had become a fixed idea in old Maurice's mind, still, conquered by her earnestness, he modified it so far as to promise that if, at the end of the year, Mary could bring him half the sum originally demanded—namely, ten guineas, and this fairly earned by their united industry—he would be proud and happy to welcome her as his daughter. In the meantime, he also required a promise from Ellen to keep both this meeting and agreement a secret from every creature except Mary herself.

'From Garret?' asked Ellen pleadingly.

'Yes, from Garret especially,' said the old man. 'Can Mary be depended on to oblige me in this?'

'You shall see,' answered Ellen proudly. Old Maurice smiled; and ratifying the treaty with a warm benediction and shake of the hand, they parted, mutually pleased. Since then, long months had passed away; and yet not so very long, for hope and constant industry had made the time seem short; and if Garret would sometimes, without those aids, wax impatient, a gentle word from Ellen, reminding him of his promise, would induce him to keep it with a good grace. He would good-

humouredly say, 'You are our pilot, Ellen, and in such hands it would be hard indeed if we refused to answer the helm.' While Mary, assenting with beaming eyes, would think to herself, 'Ah! if he knew but all.'

But now the time was drawing very near. The 'Sarah Jane,' the vessel in which Garret was to have taken a berth last year, was to sail again in another month; and more than once of late he had mentioned this in a way that plainly showed his mind was dwelling on the voyage. The two girls worked harder, more perseveringly than ever; but they lived in a remote place, and, until Mrs Villars's kindness had provided them with employment, their tasks had been precarious, and remuneration small; so that when, on that very morning, after a painful interview with Garret, the sisters reckoned over their little hoard, they found it scarcely amounting to two-thirds of the requisite sum, and Ellen sadly acknowledged that, from former experience, she was convinced it was useless to expect any further concession from old Maurice.

In this desponding mood she was found, as we have related, by Mrs Villars, who listened to her artless narrative with deep and unaffected sympathy. When all was told, she spoke a few words of comfort and encouragement, expressive of the great use of trial to fortify and exalt the mind; and dwelt upon those lovely traits in Mary's character which had been just described, and which might have withered away under too bright a sun. Then opening the little parcel she still held, she unfolded a large square of lace, and laying a pattern before Ellen, said, 'Do you think, Ellen, you both could work this into a veil, and have it ready by this day month? It is for a young friend to wear at her wedding, and you shall have five guineas if you do it well.' Ellen's heart gave one wild throb; for a moment she tried in vain to speak; then finding utterance, poured forth her thanks and hopes with a rapidity almost unintelligible. 'Five guineas!—oh, dearest lady, what would we not attempt for that? Five guineas!—why, it has taken nearly a long year to put so much more together, and now it will seem but a day to earn the rest; and then you will at last be happy, my own Mary—happier and better for all your trouble. Oh, ma'am, fear not but we will accomplish it; and night and day we will work until it is done.' And night and day they worked, Mary at the plainer part, Ellen at the delicate stitches; while with admiration and renewed hope they contemplated each morning the progress they had made. At first Ellen thought to have given Mary the pleasure of a surprise, and, until it was done, to keep the amount of their reward a secret; but they had been too long accustomed to sharing every thought, to practise any concealment now; and one day remarking an unusually rapid progress, the whole truth burst in gladness from her lips.

To describe Mary's delight and astonishment is impossible. More busily she could not work, and for a while her trembling fingers refused to work at all; but day after day the sweet hope strengthened, and at last the appointed morning came, and found their task all but completed. It was, however, a day of unusual interruptions; and Ellen had each hour fresh cause to admire the improvement in Mary's temper, as, without an impatient word, she would lay aside her work and attend to every demand. But evening still found them at their unfinished task, and Mrs Villars required it that night at the very latest. Just as they were busily employed, in came Garret with his usual request for an evening walk, and, half-affronted when refused, he said reproachfully, 'I believe there is some charm in that cobweb, for you never will put it by. Here I have tried in vain to get you out for an entire month. I will begin to think at last, Mary, that you take no pleasure in my company.'

Mary's quick feelings rose at this undeserved reproach, and, with somewhat of her old spirit, she was about to retort; but remembering all their past sorrow, all her present hope, she paused and answered gently, 'To prove the contrary, Garret, I condemn you never to leave me till this cobweb, as you call it, is fairly spun; and then——' She stopped short with a gasp, at having so nearly betrayed her secret; but her look was so eloquent of love and hope, that Garret started from his chair, and bending over her, inquired in hurried tones, 'What then?—dearest Mary, what then?'

She threw back her head merrily as she looked up into his face; and though she tried to compose her features, a thousand smiles and dimples contradicted the demure accent with which she continued, 'And then you may come with us when we take it home.' Both Ellen and Garret laughed at this anticlimax; Ellen especially, well knowing what was in the glad girl's heart, and amused, besides, at Garret's somewhat puzzled countenance. But that soon brightened again under the happy influence; and, without seeking the reason why, he found himself chattering away with a lighter heart than he had felt for months.

The moon arose; but as that fair light has business of its own, our workwomen reserved it for a future hour, and sent Garret for the more terrestrial assistance of a pair of candles, to put the few concluding stitches to their work. At length behold it finished! Ellen resigned the last two or three stitches to her sister, that by her hands it should be completed; and, holding it up with an exclamation of triumph, poor Mary gazed joyfully at it for an instant, then flinging her arms round Ellen's neck, burst into tears. Garret looked on wonderingly, and made some efforts at consolation so wide of the mark, that Mary's weeping was at once changed into laughter, until her bright eyes overflowed again. Ellen at last, remembering that the best of men may sometimes grow impatient, and unwilling to try Garret too far, laid her hand on his arm, and said, 'This is a bridal veil, Garret, and Mary and I have worked hard day and night to have it ready; it is to be worn by a fair and happy bride, while we——'

Garret required no further explanation of Mary's tears and excitement; and shaking off Ellen's hand with an upbraiding glance, as if he thought her for once in her life unfeeling, he answered warmly, 'And if she is ever so fair and happy, she cannot be fairer than my own sweet Mary, or more deserving of the happiest lot.' Then, before she had time to answer, he seized the veil, and playfully throwing it over Mary's glossy hair, he added, 'Now tell me, Ellen, will there ever be a fairer bride than that?'

But he was answered by a loud cry from Ellen. In passing, the veil had touched the flame of the candle, and in an instant the delicate covering was in a blaze. Quick as thought, she tore it from that beloved head; the next moment it lay in scorched and worthless fragments on the floor. To describe their consternation, their revulsion of feeling, is impossible. The present calamity was so overpowering, that for the minute it swallowed up all thought of remoter consequences, and—pale, speechless, and aghast—they gazed in silence first at one another, then at the fragile object on which their hopes so lately rested. At last Mary, pale as death, and almost as calm, laid her arm on her sister's neck, and in a low sad tone murmured, 'You see, Ellen, 'tis not to be!' Those words, uttered so despondingly, and Ellen's piteous tears, revealed to Garret somewhat of the truth; and though he could not guess the full extent of the misfortune, still he became at once aware that, in a moment's heedlessness, he had destroyed some plan essential to the happiness of all, and his self-accusation almost amounted to despair.

* * * *

It was morning once more; the sun shone out as brightly as if it had only to awaken light and happy hearts, and the sisters had arisen betimes, and again were busy with their daily work. With the poor, there can be no useless indulgence of regret, and the labour of one hour often conquers the sorrow of the preceding; but we cannot wonder at the languor that now hung over Mary's usually active movements, or blame the

large tear that would escape from her long, dark eyelashes, as a gentle sigh from Ellen now and then caught her ear. Otherwise, they were quite silent; they had exhausted the language of sorrow; and it was not at once the foundations of hope could be laid again. Still, they both were occupied with their different employments when a footstep approached, and looking round, Mary saw old Maurice Mahony standing in the doorway. Starting at sight of such an unusual visitor, her first thought was of Garret—that some harm had befallen him, and, trembling violently, she found herself unable to ask; but Ellen, with more self-possession, wished him good morning; and as he answered, 'Good-morrow,' kindly—'Always busy, I see,' the tones of his voice at once reassured poor Mary, and awakened, she scarcely knew why, some indefinite feeling of hope.

He had not addressed her, but he now held out his hand, and drew her to a chair, beside which he seated himself. Ellen laid by her work, and there was a momentary pause of stillness and expectation. Maurice was a remarkable-looking man. His hair, almost snow-white, combed back into smooth, old-fashioned curls, and his clothes, cut according to the fashion of a former generation, would have given him the appearance of great age, had it not been contradicted by his fresh complexion and still elastic step. His tall figure, scarcely stooped until his recent illness, and his firm, well-shaped mouth, and sagacious eyes and forehead, betokened an intellect still retaining all the vigour of its prime. He sat, as we have said, for a moment in silence, looking at the two anxious girls. At last he spoke; and, still retaining Mary's hand, related how Garret had returned home last night in a state little short of distraction; his heart so entirely full of one subject, that though it had never been renewed between them since the first painful day—under the influence of strong excitement, the interval seemed as nothing—the long-smothered feeling burst forth, and he told him all that had occurred.

'It was very late,' continued the old man, 'but I could not go to rest till he came in, for I had felt all the evening more lonely than usual. The fire burnt low as I sat before it in thought; and fancy brought back again her I had laid long years ago in her narrow grave, and the children that had followed her; and I could see them all again smiling and chattering round the hearth, as they used in those old hours. At last, from being very sorrowful, those memories grew pleasant, and a dawning of the future seemed to gain upon the shadows of the past. I began to think; for the heart,' added the old man solemnly, 'is often prepared within itself for the way it ought to act; I began to ask myself why there were not smiling faces and sweet young voices round my hearth again, and why my best and only one was at that moment under the roof of a stranger—his thoughts full of bitterness against the old father that loved him all the time better than the veins of his heart——' 'Oh no, no,' interrupted Mary softly. Old Maurice sighed as he continued—'If it was so, Mary, I had to blame myself. It was shown me then that I had been too positive and unbending; and Ellen's words, and all her loving arguments, came back fresher to my mind than the day I heard them. I was not so hardened as you thought me that day, Ellen,' added he, turning to her; 'but I thought a little trial would do the young people no harm; for I knew their hearts were in the right place, only they wanted ballast. But it is not good for short-sighted mortals to take the province of the Most High. When He afflicts, He sees and knows all things. We may often do mischief, though intending good, when inflicting needless trial on the hearts that love us; and so Mary, achree, even before Garret came in, I had resolved on my future course, and was waiting to tell him so before I slept that night; but when he did come, and all was told—all the mischief he had done, and the sweet, patient way you bore it—I thought the night too long till I could come and relieve my own heart and yours.

'And now, Ellen,' continued he, 'how far were you able to fulfil your promise? for that you both did your best, I have no more doubt than that the sun is shining on us now. I often noticed you hard at work when you little thought I was passing, let alone the good report from every one that ever names you. And there was a promise too, Ellen, that you made for another,' added the old man with a smile; 'and Mary, asthore, you kept it well, as I saw by Garret last night; and though he'll hardly thank me for teaching you to keep a secret from him, he'll feel it makes you the worthier of his trust in time to come. Is this the money?' asked he, as he took the little box containing their united earnings from Ellen's hand, and poured out the precious hoard upon the table—half-crowns, shillings, sixpences, even halfpence—all as they had been received and deposited there, and a tear glistened in the old man's eyes as he reckoned over those tokens of affection and persevering industry. The sum amounted in all to little more than seven pounds; and when the total was announced, Ellen shook her head as she remarked, 'It would have been too little after all.' 'It is enough,' answered Maurice quietly; and selecting from amongst the coins a crooked sixpence, which, pierced with a little hole, had once probably been a true-love token, he added, 'I shall keep this for a luck-penny while I live; after that, Mary, it shall be yours in memory of this day. That is our share. The rest, dear Ellen—for your sake only I wish it had been more—but, such as it is, keep it till you meet with some old man as unreasonable as myself.' Ellen remonstrated; but in vain. Old Maurice made it a condition; and as Mary took his side, two to one carried the day: then, in compassion to Garret's impatience, he left them, as he said, to have his place better filled.

With what different feelings did the little group again pursue their way to the residence of Mrs Villars. Forgetful of her own disappointment, she had listened with kind and womanly sympathy to their sorrowful communication the night before, and now they hastened to tell her of their joy, and to ask her whether the time could possibly allow them to repair the accident by working another. 'All for love, dear lady, this time: you must not think of offering us any money now!' But Mrs Villars had already taken measures to supply the loss, and, as her best apology for the delay, had transmitted to her young friend the burnt fragments of the veil as an evidence of the beauty of the work, and of the accident which destroyed it. In relating the circumstances, she added the hope that, as in Ireland a conflagration was considered an auspicious omen to a bride, good fortune might attend those relics in a tenfold proportion to the sorrow they had caused; and the young English girl, as she smiled at the augury, sent a thought across the waters from her own happy home, and determined not to enjoy the prosperous influence alone. She laid the open parcel on the table, and told its story in a way that went home to the hearts of her auditors. Had she been covetous, she might have made Mary Roche the richest of her name; but, guided by judgment as well as feeling, she contented herself with accepting a trifling gift from each, and so realised a sum which, though moderate in her eyes, far more than compensated for the labour they had lost. It was forwarded to Mrs Villars, who divided it equally between the surprised and grateful girls; and it would have been more than human nature, had they not felt some little pleasure in the consciousness that Mary was not a portionless bride after all.

She and Garret never forgot their separate lessons of perseverance and patience acquired in that year of probation. They had truly learned them by heart, and such experience is seldom obliterated; and Ellen, happiest in the happiness of others—the dearest object of her heart attained—still felt that she had a sacred duty to perform. She devoted herself more entirely to her father, and, in studying his wishes, endeavoured gradually to improve them; and she was rewarded. Drawn to each

other by the absence of their mutual companion, he seemed each day more conscious of her excellence. Stimulated by the example of her cheerfulness and industry, he began to feel ashamed of his own listless indolence; and by degrees shaking off the influence of habit, he became an altered man. The 'Work-girl's' cup of joy was full!

POPULAR MYTHOLOGY OF THE MIDDLE AGES.

In a former paper, we gave some illustrations of the Literature of the Middle Ages, drawn from a recently-published work, containing much interesting antiquarian information: the following notices of the popular mythology of these ages are derived chiefly from the same source.

The old Teutonic Pagans, whose irruption into the provinces of the Roman empire, in the fifth and sixth centuries of the Christian era, is always to be regarded as the true commencement of what we call modern history, brought with them, from their Scandinavian homes, a mythology like themselves—wild, imaginative, savage, and colossal. The sea, to them, was peopled with grendels and monster-snakes, which inhabited caves along the coast, or dragged their oozy length along the bottom, now and then rising to the surface to grapple the boats of the fishermen in their folds: the fens, rivers, and forests, had their nickers and fire-drakes, which devoured travellers, and sallied out from their dens at night to ravage the surrounding country: the very air was full of demons, elves, and goblins, to whom rain, sunshine, wind, sleet, hail, and storm, were owing. The existence of these multitudinous supernatural beings was as much a part of the modern polytheism, which believed in Thor and Woden, and the other huge Teutonic deities, and represented them feasting together in the hall of the gods, and drinking bucketfuls of ale with uproarious mirth, as the existence of satyrs, fauns, and nymphs, was a part of the old Homeric polytheism, with its blue-eyed Minervas and its imperial Jupiters. Now, just as Christianity had to overthrow the polytheism of the ancient Greeks and Romans, in order to establish itself in the Roman empire, so, on the irruption of the Teutonic races, it had to triumph over the religion of Thor and Woden, in order still to be supreme. Both these conquests it achieved. Slowly, but steadily, it crept from Jerusalem over the surface of the Roman empire, eating out, or dissolving into itself, all existing beliefs and philosophies, till it became the prevailing religion; and finally, when the empire was overrun and shattered by the German invaders, it rose, clear and spire-like, out of the universal wreck, asserted its supremacy over the conquerors themselves, and made Europe its own again. The popular beliefs, however, bore the marks of both these conflicts. The theology of the early ages, or the ages of the Fathers, was tinged with the heathen philosophy of Plato and others; no doubt also with the old polytheism of Greece and Rome, although this in an inferior degree, as that mythology had already become aged and decrepit. In the conversion of the German races, the case was somewhat different. Here there was no civilised philosophy, no Platonic or Peripatetic school to contend with, and exert an influence over Christianity; but, on the other hand, there was a young, vigorous, fresh, and poetical mythology, with grendels, goblins, fire-drakes, and thousands of other unconquerable things. Accordingly, the popular mythology of the middle ages was a compromise between Christian ideas and Teutonic legends. There was so much of course of the old German creed, which had to be entirely abandoned. Thor and Woden, for instance, and the other gods, had to be given up as totally incompatible with the new faith; but there was a great portion of the old belief which did not appear so reprehensible in a Christian point of view, to which, therefore, the clergy did not object so vehemently, and which ultimately, with some changes of phraseology, was adopted into the popular creed of all Christian nations. 'Even now,' says Mr Wright, 'after so many centuries of successive improvement and refinement, in our salutations, in our eating and drinking, even in our children's games, we are perpetually, though unwittingly, doing the same things which our forefathers did in honour or in fear of the elves and nymphs of the heathen creed.'

The clergy, as the guardians of the popular faith, were intrusted with the charge of deciding what old Teutonic legends and practices were admissible in the new constitution of society. That they exercised this right to the suppression, or at least to the discouragement, of many Pagan practices which the laity were disposed to keep up, is proved by numerous laws passed by the clergy in Anglo-Saxon times against such practices. In one old Anglo-Saxon *penitentiary*, for instance, the following regulations occur. '"If any one observe lots, or divination, or keep his wake (watch) at any wells, or at any other created things, except at God's church, let him fast three years: the first on bread and water, and the other two, on Wednesdays and Fridays, on bread and water; and the other days let him eat his meat, but without flesh.

"The same for a woman who useth any witchcraft to her child, or who draws it through the earth at the meeting of roads; because that is great heathenness.

"If a mouse fall into liquor, let it be taken out, and sprinkle the liquor with holy water; and if it be alive, the liquor may be used; but if it be dead, throw the liquor out, and cleanse the vessel."'

The Teutonic nickers, elves, and other supernatural beings, however, were too strongly lodged in the popular imagination to be easily expelled; and accordingly, all that could be done was to give them new names, or at least, retaining their old names, to assign them functions in accordance with the prevailing theology of the time. An immense number of them were forthwith converted into devils, subordinate to the Evil Principle of Scripture. To these devils, besides their principal function of tormenting and misleading mankind, was assigned a large share of influence in all natural phenomena, especially in meteorology. 'The monks,' says Mr Wright, 'sometimes invented strange stories to account for the influence which the devils thus exerted, because they were not aware of the real source from which they had been adopted. An inedited English poet of the thirteenth century, after explaining, in a popular manner, the nature of thunder and lightning, proceeds to show how it happens to cause so much mischief. "When Christ suffered death," says he, "he bound the devil, and broke down hell-gates in order to let out those who suffered there. His visit was attended with such terrible thunder, that the devils have been afraid of thunder ever since; and if any of them happen to be caught in a storm, they fly as quick as wind, and kill men, and destroy trees, &c. which they meet in their way. This is the reason that people are killed in a storm."'

As a curious illustration of the transition of old Teutonic ideas into the popular theological language of the middle ages, we may mention that our 'Old Nick' is a mere corruption of the word 'nicker'—the name of a large class of supernatural beings among the German Pagans, generally supposed to be water fairies. The modern 'Old Nick' is, therefore, literally the old 'nicker.'

Few countries retained so much of the old Teutonic mythology as England; and, strangely enough, it is from the Lives of the Saints that we derive most of our information respecting the Teutonic elves and fairies. 'A more extensive knowledge,' says Mr Wright, 'of the Anglo-Saxon fairies may perhaps be gathered by a careful perusal of the legends of the Anglo-Saxon saints, than all the other books together can afford us. It only need be borne in mind, that in the transformation, the elves, when mischievously inclined, became devils; when beneficent, angels. The fens and wilds are, in Beowulf,

constantly peopled by troops of elves, and nickers, and worms (dragons and serpents). So, in the saints' legends, are they ever the haunts of hobgoblins (*dæmones*); and many and fierce were the struggles between them and the hermits, before the latter succeeded in establishing themselves in their deserted abodes. St Guthlac built him a mud-cot in the isle of Croyland, a wild spot, then covered with woods, and pools, and sedgy marshes. The isle had hitherto been uninhabited by men; but many a goblin played among its solitudes, and very unwilling were they to be driven out. They came upon him in a body, dragged him from his cell, sometimes tossed him in the air, at others, dipped him overhead in the bogs, and then tore him through the midst of the brambles; but their efforts were vain against one who was armed like Guthlac.' 'Sometimes these goblins were more obliging towards their new neighbours, and directed them where to dig for treasures; though it appears that they seldom gained much by seeking after "heathen gold." Godric, a celebrated saint, occupied a cell in the wilds of Durham, and was often troubled by these spiritual enemies. On a time, however, one of them appeared by night, and told him where he would find a hidden hoard. Godric was not, it appears, an avaricious man; but he thought he might do some good with the money which was thus revealed to him, and to work he went with pickaxe and shovel. When, however, he had dug a considerable depth—though we are not told that he obtained a sight of the promised treasure—he was terror-struck by seeing come out of the hole a troop of small black dwarfs, who, with a laugh of derision, cast at him little smoking balls. Godric dropped his shovel, and, it is almost needless to add, never sought treasures again.'

The elves or goblins of the middle ages are distinguishable into three classes: the positively malevolent, who were accounted imps or emissaries of Satan, and whose constant purpose was to ruin souls; the good and benevolent, whose nature partook more of the angelic, and who made the improvement of the human race their object; and the merely eccentric or mischievous, who, leading an independent existence, delighted, solely for their own amusement, to intermeddle in human affairs, and whose aim seemed to be more physical confusion than moral evil. These last, called often the 'merry sprites,' 'made their presence known by throwing dirt, and other harmless things, at every one they came near; and they continually plagued them by cutting holes in their coats, and playing other such mischievous pranks. Sometimes they would talk with the people of the house; and when displeased, or mischievously inclined, they scrupled not to tell in their presence all their secrets and private actions, much to the shame and confusion of many who were so exposed. When any attempt was made to exorcise them, they threw dirt at the priests themselves; and Giraldus thinks, from the inefficiency of the exorcisms of the church in driving them away, that the power of the priests was only efficient against spirits of a malignant nature. During the reign of the first Richard, there appeared frequently, and for a long space of time, in the house of Sir Osbern de Bradwell, at Dagworth in Suffolk, "a certain fantastical spirit," who conversed with the family of the aforesaid knight, always imitating the voice of an infant. He called himself Malkin; and he said that his mother and brother dwelt in a neighbouring house, and that they often chided him because he had left them, and had presumed to hold converse with mankind. The things which he did and said were both wonderful and very laughable, and he often told people's secrets. At first, the family of the knight were extremely terrified; but by degrees they became used to him, and conversed familiarly with him. With the family he spoke English, and that, too, in the dialect of the place. But he was by no means deficient in learning; for when the chaplain made his appearance, he talked in Latin with perfect ease, and discoursed with him upon the Scriptures. He made himself heard and felt, too, readily enough; but he was never seen but once. It seems that he was most attached to one of the female part of the family, a fair maiden, who had long prayed him to show himself to her. At last, after she had promised faithfully not to touch him, he granted her request, and there appeared to her a small infant, clad in a white frock.'

These sprites were generally invisible, as this story intimates. There were persons, however, who were gifted with the faculty of seeing these elves, and who described to others their shape and appearance. One of these elf-seers was Ketel, a pious rustic, who lived at Farnham in Yorkshire, of whom many anecdotes are related by the historian William of Newbury. 'While but a lad, Ketel was one day returning from the field, riding on the wagon-horse, when suddenly, in a place perfectly level and smooth, the horse stumbled, as though he had met with an obstacle, and his rider was thrown to the ground. As he raised himself up, Ketel beheld two very small black elves, who were laughing most lustily at the trick they had played upon him. From that hour was given to him the power of seeing the elves, wherever they might be, and whatever they might be doing; and he often saved people from their malice. He assured those who were fortunate enough to gain his confidence—for he did not tell these things to everybody—that there were some hobgoblins who were large and strong, and who were capable of doing much hurt to those who might fall into their power; but that others were very small and contemptible, incapable of doing much harm, and very stupid and foolish, but who delighted in tormenting and teasing mankind. He said that he often saw them sitting by the roadside, on the look-out for travellers, upon whom to play their tricks, and laughing in high glee when they could cause either them or their horses to stumble, particularly when the rider, irritated against his steed, spurred and beat him well after the accident. Ketel, as might be supposed, drew upon himself, by his officiousness, and by his power of seeing them, the hatred of the whole fraternity.'

Besides the knowledge derived of the appearance of the elves from the relations of such gifted individuals as the elf-seer Ketel, there were ways and means of catching an elf for personal inspection. The English chronicler, John of Brompton, tells of the capture of an elf of dissipated habits, who, in the earlier part of the twelfth century, haunted the cellar of a monastery in the bishopric of Treves. 'One morning, when the butler entered the cellar, he was not a little mortified at finding that, during the night, a whole cask of wine had been emptied, and that at least the greater part of its contents had been spilt on the floor. Supposing this accident to have arisen out of the carelessness of his man, the butler was angry, chid him severely, and, locking the door of the cellar, took the key into his own charge. But all his precautions were vain, for, the next morning, another cask of wine was in the same condition. The butler, now utterly astonished, repaired in all speed to the father abbot; and, after due consultation, they went together to the cellar, where, having sprinkled all the barrels with holy water, the latter closed firmly the door, sealed it with the seal of the abbey, and took the key into his own keeping. Next morning he repaired again to the cellar, and found the door exactly as he had left it. The door was speedily opened, and the first object which met his view was a small black elf, sticking fast by his hands to one of the vessels on which the holy water had been thrown. The abbot took the elf, clothed him in the habit of a monk, and kept him long in the school of the monastery, where he never grew any bigger. But one day an abbot from a neighbouring monastery came to examine the scholars, and, on hearing the story, counselled his brother abbot to keep no longer the devil in his house. The moment his monkish robe was taken from him, the elf vanished.'

It was not altogether, however, on the relations of

elf-seers, or the occasional capture of a single specimen of the elf-kind, that people depended for their notions of this extraordinary class of beings. There were many cases of elves attaching themselves to particular households in a visible shape, and continuing for weeks, or even months, to go about doing all kinds of work in an efficient manner. 'In Pembrokeshire, an elf took up his abode in the house of one Elidor Stakepole, in the form of a red boy, who called himself Simon. Master Simon began, "impudently," says our author, by taking the keys from the butler, and usurping his office. However, he was himself so provident a butler, that, while he held the office, everything seemed to prosper. He never waited to be told to do anything; but whatever his master or mistress was thinking of calling for, he brought it immediately, saying, "You want so and so; here it is." Moreover, he knew all about their money and their secret hoards; and often did he upbraid them on that account, for he hated nothing more than avarice; and he could not bear to see money laid up in holes, which might be employed in good and charitable uses. There was nothing, on the contrary, he liked better than giving plenty to eat and drink to the rustics; and he used to tell his master, that it was right he should be free in giving to them those things which, by their labours, he himself obtained. Indeed, Simon was an excellent servant; but he had one failing—he never went to church, and he never uttered a single "Catholic word." One remarkable thing was, that he never slept in the house at night, though he was always at his post by daybreak. Once, however, he was watched, and found to take up his lodging about the mill and the mill-dam. The next morning Simon came to his master, delivered up his keys, and left the house, after having filled the post of butler for about forty days.'

The most famous of all these visible elfs, however, was Friar Rush, whose adventures form the theme of numerous legends of the middle ages. The idea of the story of Friar Rush is much higher than that of most goblin stories. In a certain abbey, the site of which is variously given in different versions of the story, the monks are living in a scandalously immoral manner. The devil instantly perceives that there could not be a better centre from which to operate upon human society than this abbey. Accordingly he, or at least one of his demons, appears at the abbey gate in the form of a young man wanting employment. He is received into the abbey, serves some time in the kitchen, rises to be master cook, and finally, after eight years, to be a friar. In the guise of a friar he works all manner of mischief: at first in the abbey itself, then in its immediate neighbourhood, and lastly, in other countries, into which he travels. It will be perceived what scope for powerful satire and invective against the vices of the age was afforded by such a device, in which the Evil Principle is made to assume the garb, and occupy the position, of a professing servant of Heaven.

In Mr Wright's work there is a very interesting chapter on the superstitions of modern Greece, in which it is shown that, among the peasants of that classic land, numerous myths and legends are current, identical with those current among the English, the Scotch, the French, and the Germans. He accounts for this by supposing all such legends, wherever found, to be of Teutonic origin. 'The dissimilarity,' he says, 'of many superstitions of the modern Greeks to any mentioned by the ancient writers, and the time at which they begin to be first alluded to, can leave little doubt of their having been introduced by the barbarians who crowded in at the decline of the empire. Their resemblance to those, of which a great part still exists among the nations of Teutonic blood, seems to point at once to the quarter whence they came. We could adduce many proofs of the numbers even of Norsemen who were in Greece at an early period, had we room.'

The popular mythology of all the European nations is, therefore, according to Mr Wright, derived from the German races; and to trace this mythology beyond the fifth and sixth centuries, would be to inquire into the origin of these races, and their history previous to their invasion of the Roman empire.

VISIT TO THE CRYPT OF THE CAPUCHIN CONVENT AT MALTA.

BY A LADY.

'Will you go on, or are you afraid?' These words were addressed to me by an old monk, as we stood together on the last step of the stair leading down to certain mysterious vaults which exist under the Capuchin convent of Malta. The monk was very decrepit, very ghastly—indeed, I may say, decidedly unearthly-looking—the voice was sepulchral, and the question not one to be answered without serious consideration; for he held in his hand (and the hand was uncommonly like that of a skeleton) a great key, which was destined to open the ponderous iron door of a very singular charnel-house. This convent is one of the very few, in fact, I believe the only one of importance, now extant, excepting that of Palermo, where the monks still retain the custom of preserving their dead unburied, and are yet in possession of the method by which they can keep the corpses of their brethren entire, with all the appearance of life, for as long a period as they choose. The secret of the process by which the order of the Capuchins have thus learnt to cheat the grave of its lawful prey is not exactly known; I believe it is some sort of baking or boiling. They have always the number of forty carefully preserved; and when a death occurs in the monastery, the most ancient among the dead bodies makes way for the new-comer, and is buried. I had been told that the spectacle of these forty monks, so long departed from existence, yet still unshrouded and uncoffined, was most curious, although sufficiently appalling to render it less frequently visited than it would doubtless have otherwise been. For myself, however, it had been my lot, in my various wanderings, to see death in so many different shapes, that I could hardly shrink from any new aspect under which it might present itself, and I had therefore advanced thus far on my way to visit them. Still, I must own I was a long time of answering the pointed question of my companion: to tell the truth, there was something in his own appearance and manner which awed me considerably; and I could not help wondering what the dead monks must be, if their living brother had so little the semblance of humanity. There was a dulness in his sunken eye, a solemn expression on his livid face, half hid by the huge cowl, and something so mechanical in his every movement, that it was scarce possible not to fancy the soul itself was wanting. These were the first words he had uttered since he had suddenly appeared at my side, in obedience to the call of the superior; and now having spoken, he closed his withered lips again, as though these hollow tones were to issue from them no more, and stood motionless till I mustered up courage to pronounce an emphatic 'Vado' (I go), when he instantly stalked silently along the dark, narrow passage, and unlocked the massive portal of the chamber, whose silent inhabitants I was about to visit. The door rolled back heavily on its hinges; the ghostly monk stood back to let me pass; and as I crossed the threshold, I heard him close it behind me with a noise which echoed, as it seemed to me most ominously, from vault to vault.

I found myself in a large hall, constructed entirely of the white Maltese stone, the roof rising in the shape of a dome. It was lighted only from the top, so that although every object was perfectly distinct, the day could only penetrate within it, tempered by a kind of twilight shade. The very first breath I drew in this dead-house, made me gasp and shiver. It was not precisely cold; but there was a chill, and an undescribable heaviness on the air, which caused a most unpleasant

sensation. It was some minutes before this feeling could be shaken off; at last I determined boldly to raise my eyes and look around. For a moment I could have fancied we had mistaken our way, and returned to that part of the vast convent which was inhabited by the living, the scene was so very similar to that I had just witnessed in the chapel above, where the vesper service was being performed. Standing upright, in niches cut in the wall, the forty monks were ranged round the room, twenty on either side of me, clothed in the complete costume of their order. At a superficial glance, they seemed all engaged in prayer; and very still and quiet they were, with their heads, from which the dark cowl was thrown back, bent slightly over their clasped hands. Alongside of each one was an inscription, giving his name, and the date of his death; and it really required some such announcement to bring to my mind the full conviction, that it was indeed on lifeless corpses I was gazing; for, except that all had the same uniform hue of dull, ghastly yellow, and the same fixity in the position of the eyes, there was nothing in their outward appearance to indicate that they had not, each one of them, a living, throbbing heart within his bosom. The flesh was firm, the limbs retained their shape, the lips their colour; the very eyelashes and nails were perfectly preserved; and the eyes themselves, though fixed, as I have said, did not look dead or rayless. It was a frightful mockery of life, because so frightfully real. I could see no difference between those mummies and their deathlike brethren up stairs; whose long confinement in the cloister, and strict adherence to the most severe of the monastic rules, have wasted their bodies, quenched the fire of their eyes, and banished all expression from their faces. But when I went nearer, in order to examine them regularly one by one, I saw that the Capuchins, who have thus the secret of triumphing over corruption, and, outwardly at least, would seem to set even death at defiance, had altogether failed in one most important point. They had preserved the bodies from decay; they had clothed them in the garments they were wont to wear; they had marvellously banished the likeness of death; the skin, the hair, the hands, were as those of living beings; but, with all their art, they had been powerless to efface from the countenance of each one of these dead men the seal which the soul had stamped thereon as it departed. All the faces wore the expression with which they had died; different according to their various temperament, but fixed, immutable, unchangeably eloquent of the exact frame of mind in which they had separately met that awful hour. It even seemed as though, in this expressive look (the last trace of spirit petrified, as it were, on the dead face), might be read not only the record of their dying moments, but also the history of their past lives; showing how the good man, humble and sincere, had departed in peace; and how the disappointed, ambitious soul had clung to a life which years of asceticism had vainly sought to render odious. It is sufficient, however, to look only once in their faces, to lose instantaneously the effect of the delusion, which is so striking at a first glance. The imitation of life, cunning as it is, fails altogether before this palpable evidence of their having undergone the last dread trial.

The body nearest me, which was that of an old man, had a countenance which would have told its tale clearly to the most careless observer. I felt, as I gazed on his serene and placid face, that death had been to him a glad release: he had waited, he had wished for it; and when it came, he had resigned himself to its power, as a child sinks to sleep on its mother's breast. The strong lines round the shrivelled lips, the deeply-furrowed brow, the hollow eye, all told of a weary conflict past—of tears which had been very bitter, of that long struggle with sorrow which can make existence a load most gladly laid aside. But there was a sublimity of repose upon that old man's face, which life could never have known. And the next! I wish I could forget the awful face of the next in order; but I know I never shall: the expression of that countenance will never cease to haunt me! The fierce scowl on the forehead, the eyes starting from their sockets, the lips convulsively drawn back, so as to show the sharp, white teeth firmly clenched, all told an unwillingness to die—an utter dread of dissolution, which it is frightful to think of! Here were, indeed, again the traces of a conflict, but a conflict with death itself. It was easy to see how madly, how wildly, he had struggled to retain his hold on life; and when that life escaped, it had written on his face the record of that last hour as one of most intense despair. Assuredly this man must have been a slave to the memory of some great crime, which made him so very a coward in presence of his invincible foe; or else—for he seemed too young for that—he may have had one of those morbid, restless spirits of inquiry which ever drove him to the burial-places, that he might rifle the secrets of the grave, to learn the details of the universal doom, till he was seized with a frantic horror for the individual corruption which awaited himself, such as I have known men of imaginative minds to feel. Anyway, it was a fearful face. He had fought with the King of Terrors, and been subdued, but the struggle had been a dire one; and what rendered this yet more striking, was the mock resignation with which the hands had been folded together after death. I was glad to pass on, though it was to look on a corpse which could only inspire disgust; it was so evident that this one had died even as the beasts that perish. His heavy features were full of sottish indifference: he could not have foreseen that his hour was come; or, if he did, his must have been one of those narrow, grovelling minds, too completely filled with the daily occurrences of life to wake up and look beyond it, and question eternity. Next to him was one who had expired in extreme suffering from some terrible disease: his face told of nothing save bodily pain; but so expressive was it of this, that it was scarce possible not to believe that he was even then in great agony. Again—I could have looked for ever on the face of him who stood next in the line. Where the expression on the face of the dead is beautiful, it must be infinitely more so than it ever can be while living; and in the still eyes of this corpse, in the sweet smile that brightened even that livid mouth, there was a fervour of hope and faith not to be mistaken. He was very young, and had probably been cut off in the first enthusiasm of his vocation, ere time, or the imperishable craving for human sympathy, had quenched the ardent religious fervour, which is so sincerely felt by many young novices on their first profession. I was very glad he died when he did, it was so glorious a look of triumph! Strange to say, the most unmeaning of all these faces was that of a man who had been murdered: there was a mere vacant stare of surprise in his wide, glaring eyes. The spirit seemed to have been so suddenly expelled from her mortal tenement, that she had left no trace of her passage forth. Near to this ghastly corpse stood a young man, who appeared to have fallen gently asleep, with that expression of utter weariness which is the very stamp of a broken heart.

When I had gone round about half the room, and had minutely examined the features of some twenty of this ghostly company, I was seized with a very strange hallucination. On entering into the presence of these forty monks, I had been fully aware, of course, that they were all dead, and I alone was living; and now I was equally conscious that there was some vast difference between the present state of my grisly hosts and my own; only, after I had gone from one to another, ever meeting the gaze of their meaning eyes, and gathering such volumes of eloquence from their still lips, I could almost have believed that they were all living, and I myself dead, or in a dream! It was quite time to hold some communication with the living when assailed by such fancies as these; and I turned to look for my guide, with a strong desire to enter into

conversation with him. I looked round and round in vain. I counted forty-one monks, therefore the living man must be amongst them; but the exact similarity of dress, and the motionless attitude with which he had installed himself between two of his lifeless companions, made it no easy matter to distinguish him. When I did find him out, the question with which I addressed him would have been considered passably unfeeling in more polite society; it was, if he himself would one day take his place in this strange sepulchre? 'Assuredly!' he answered, with more vivacity than he had yet displayed; 'and this one must make way for me,' he continued with a grim smile of satisfaction, at the same time dealing a light blow with his bunch of keys on the shoulder of one of the corpses, which caused the bones to rattle with a sound so horrible, that I flew to the door, and begged him to open it, that I might escape from this dreadful room. I had had quite enough of the society, certainly not enlivening, of the Capuchins, both living and dead: indeed, on the whole, I rather give the preference to the latter, for we claim no kindred with the dead; whereas, it must always be painful to come in contact with a fellow-creature so devoid of human feeling as this old man seemed to be. He afterwards conducted me through the whole of the convent, at least of that part of it to which strangers are admitted. It is very extensive, but principally remarkable from the strange sight I had witnessed. As this order is one of the most rigorous, the brotherhood is composed, for the most part, of men who have committed some crime, and flown thither for refuge from the vengeance of the law, or the yet sterner justice of their own conscience. Judging from the countenances of those I saw, I should say they had sought all mental rest in vain: but so indeed it must have been. It was scarcely possible that the quiet of the cloister should have any effect on them; for it is starting on a false principle to suppose that a man can ever escape from his own deed, be it what it may, good or bad. As soon as he has committed it, he has given it an existence, an individuality which he can never again destroy: it becomes independent of him, and goes out into the world to deal its influence in widening circles far beyond his ken.

Column for Young People.

THE HUMBLE BEE.

On one of our summer holidays, after the bright and sunny forenoon had been spent by the young people in gardening, and various other labours, the boys showed an unusual anxiety to be off after dinner, on some secret expedition of their own. They thus anticipated our afternoon walk by several hours. At the usual time, however, we set out; and, not without some vague expectations of finding them, we took our way through a favourite and often-trodden dell, which leads to a meadow by the river side. The sun was shining brilliantly in the west, yet a soft breeze tempered the heat, and a morning shower had cooled and refreshed the green herbage, which sprang up everywhere around us. The birches, which hung on each rocky side of the dell, sent forth a grateful odour, and the beautiful red petals of the wild roses, now in full blow, as well as the white blossoms of the bramble, and innumerable other more lowly plants, added not a little to the perfume.

'I wonder,' said Mary in the intervals of her scrambling among the rocks for the prettiest wild flowers, 'where those boys can be, or what they are about? I hope they are about no mischief; and yet the mystery they have observed regarding their expedition does not look well.'

'Oh, I should not wonder,' replies Elizabeth, 'but we shall find them with old Davie; drinking in with delight some of his stories, or chanting along with him his songs and ballads, or perhaps busily employed setting their water-wheels of rushes at the little dams and water-falls, which they have laboriously constructed. Such amusements in a sunny afternoon like this, make me wish that I were a child again.'

'I recollect well,' says Mary, 'the first time I ever heard of Robinson Crusoe was from Davie, as the good-natured old man sat down yonder in the meadow, and told us the wonderful tale, while we lay eagerly listening around him. So clear were his descriptions, that I almost thought I saw the island before me, and poor lonely Crusoe wandering on the sandy shore, startled at the print of a human footstep there. Poor, dear old Davie! many are the hours' amusement you have afforded us; I fear we have sometimes teased you, and too often wearied you. Yet we shall never forget you, and even now I have something in my basket in store for you; for your task of tending the cattle in the far-off fields must be but an irksome and lonely one at best—a cold and cheerless one too often.'

We had now passed through the narrow dell, and the grassy meadow opened up before us. It was covered with a rich, green sward, variegated with innumerable blossoms of the white and yellow clover; here and there were seen clusters of the yellow butter-cups, the daisy of all tints and sizes, and occasionally the pyramidal stem of the orchis, with its rich and curiously-shaped flowers. The sheep were busy nibbling the grass on the upper parts of the meadow, and in the more luxuriant hollows strayed the cattle, leisurely browsing in irregular groups.

'Aha!' cries Mary, 'yonder are the boys; but what in the world are they about? Henry has his jacket off, swinging it around his head, and Charles, with his head covered with his handkerchief, dances about as if he were frantic, while Davie, on his hands and knees, looks intently into the earth, as if he were seeking for hidden treasure.'

We proceeded onwards to join them, but before we had come up to the place, we were assailed, first the one, and then the others, by the large humble bees, evidently in a state of rage and irritation. They boomed round and round our heads, coming closer and closer every circle they made, and were not easily to be frightened away by any efforts of ours. The girls ran for it, and I had to use my handkerchief assiduously in self-defence. I now began to suspect the cause of all this uproar, and on coming up to the place found, as I had conjectured, that a nest of these wild-bees had been invaded. I am always averse to interfere with unnecessarily or annoy any of the 'creatures of field or flood.' This the boys were aware of, and on the present occasion they felt rather abashed. It is true they had violated no express command, and Henry pleaded that it was purely out of curiosity to see the interior and inspect the curious bee-nest, that they had thus exposed it; 'and indeed,' said he, 'had we known the danger and difficulty of the task, we would even have let it alone. We have been at least two hours engaged in digging, and in that space we have been interrupted at least fifty times, and forced to battle with the pugnacious defenders of the citadel. In these battles I am glad to say, however, that though many stings and blows have passed between us, no life has been sacrificed: the whole colony are spared, and are now dispersed, in no very pleasant mood, however, through the fields.'

'Indeed we are quite aware of that,' says Mary; 'for we have encountered not a few of them already, and they, like many other enraged beings, began blindly to wreak their vengeance on us, the first they met, instead of reserving it for you, their real disturbers.'

Taking the opportunity of this, the short dispersion of the poor, persecuted swarm, we cautiously approached to inspect the nest. The siege had been conducted, under the experienced directions of old Davie, with considerable tact. A small hole led from the surface several feet under ground, where the nest was situated. Before commencing operations, a long, pliant willow wand, peeled of its bark, had been cautiously inserted from the opening above down into the nest. Along the course of this white wand, as a guide, the assailants had dug down with their garden spades and hoes, carried with them for the purpose, till they came to the termination. The nest was an enlargement of the extremity of the narrow passage, of about eight inches in diameter. It was lined above and below with moss, and contained some dozens of rude cups of wax, slightly cemented together, some of which contained honey, and others the larvæ or young bees. Now that the invasion had been actually committed, I recommended that the whole should be again carefully covered up; and that, if they chose, they might do it in such a manner as that the future operations of the bees might be seen by us, without giving them annoyance or interrupting their labours. This, with slight directions, I left to their own

ingenuity; and we proceeded to make the circuit of the meadow, before retracing our steps homewards.

The humble bee and its habits of course occupied the greater part of our attention in our walk, and every individual bee which we saw was scrutinised with a minuteness corresponding to the interest which the subject now excited. My companions soon discovered a marked difference in the forms and colours of the various kinds which presented themselves to their notice. In the meadow-grounds we met with two distinct species—one of a large size, marked on the breast and abdomen with bright yellow stripes, and commonly known as the *Gairy* or *Brocket Bee*. To this kind belonged the nest which we had just examined. It is the only species that lives deep in the ground; sometimes the nest will be found from three to six feet deep, or rather having a slanting passage into it of this length. 'And do the bees make this long passage themselves?' I was asked. In general they do not. They take possession of the nests of the field-mouse, or any other hole or crevice which they can find. They are not bad excavators, however, when they have a mind to exert themselves. In soft ground they will form a long passage in a very short time; and when, by any means, the entrance to their nest is obstructed, they speedily clear it out, or, if this is impracticable, they make a new opening.

Another species, the *Little Brockie*, of smaller size and darker colour, often has its abode below some large stone, or in the crevice of a wall, or among a tuft of moss; but seldom goes deep into the ground, like the larger species.

'Here,' cried Henry and Charles, who had now joined us, 'is a light yellow bee, which Davie calls the *Todler Tyke*. I advise you all to take care of him, for he is a wild animal, and will fly at your head and sting if you give him the least provocation. We have seen his *byke* or nest, too; it requires no digging into, and lies often among tufts of grass, or in dried turf, or crevices of walls.' The todler made two or three booming circles around our heads in rather a menacing manner; but meeting with no opposition, he suddenly darted, with devious path, into the air, and was seen and heard no more.

'See what a beautiful bee is on that flower of red clover,' cries Mary; 'it looks so gentle and peaceable, that I shall go near and examine it. Its breast and back are of a deep purple hue, and the rest of its body of a bright red.'

'You need not fear, it will not fly at you,' says Henry; 'the mode of defence which it uses is to turn on its back, and present its sharp sting to its enemy. This is by far the prettiest, though not the largest, of the humble bees; and, according to a rhyme which Davie has taught us, it selects the finest honey of the whole; for, strange to say, different qualities of honey are selected by the different species of bees.'

'And pray, what is this rhyme which you have learned?'

'It is mere doggerel, but I believe, like other popular rhymes, it embodies the experience of accurate observers.

> The todler tyke ne'er has sic a good byke
> As the bonny gairy bee;
> But of a' the bee bykes that ever I saw,
> The red beltie bears the gree.'

In our next walk to the meadow, we found the bees' byke or nest carefully repaired, and done up, by the boys and their more experienced coadjutor, in such a manner as that, by means of a small window of glass, we could look in upon the operations of the inmates without in the least disturbing them. It formed a frequent source of amusement thus to watch them. In sunny weather they were constantly busy and at work; in cloudy and wet days they remained in a half dormant state, clustered together among the soft, warm lining of their nest, and occasionally awaking, as it were, from their sleep; one or two in succession would pay a visit to their thimble-shaped wax-combs, for the purpose of sipping the honey with which those cups were stored.

'I perceive,' said Elizabeth, after a minute examination of the colony, 'that there are bees of various sizes here, though they have all a general resemblance in their markings and colours. Do the humble bees resemble the hive-bees in this respect?'

'They do,' I replied. 'The largest bees, of which you see several here, are the large females, corresponding to the queens of the hive-bees, only they differ in this respect, that several large females may exist in the community at one time without exciting any jealousy or contention among each other. Besides these there are another set of females of a smaller size, several dozens of common working or neutral bees, and about half a dozen to a dozen of drones or male bees. On the whole, there may be from fifty to one hundred inmates of a hive of this kind. At present there are not nearly so many as this here, but you perceive that some dozens of those cups contain young bees, which are assiduously fed from the pollen, or bee dust, carried in on the thighs of those working bees. In due time those larvæ or young will add to the effective number of the colony.'

'I see two bees,' cries Mary, 'very kindly feeding some young grubs, which present their mouths to their nurses, while they not only feed them with this pollen, but apparently disgorge from their mouths a quantity of honey also.'

'These are young queens,' I replied, 'which they are thus feeding on a richer fare than what is allowed to the common workers.'

'I see two in another corner,' still continues Mary; 'a set of workers, busily employed in constructing some honey-cups. How assiduously they ply their tasks! Yet the form or finish is by no means equal to that of the six-sided combs of the hive-bee.'

'No; you must look upon these rather as rustics, who live in lowly cots in the country, and feed from rude and simple bowls. Yet you see they are contented and happy, and do not attempt anything in the way of finery. Those cups they are busy with, are destined for the reception of more young; and after they have thus served as cribs to nurse them up, they are cleared out, and filled with honey, to afford a store of food during the rainy days, when the fresh and fragrant flower-cups are not accessible.'

'But do they not require a winter store of honey?' inquired Elizabeth.

'No; the greater proportion of all those you see shall be dead before winter. It is only the large queen-mothers which survive for another season, the remainder being insects of only one year's duration. In the end of autumn you will find drones, and workers, and all, gradually drop off and disappear.'

'I recollect now,' continued Elizabeth, 'to have seen, when the chill days of autumn commence, numbers of those bees lying in a half-stupid state on the red blossom of the thistle, or in the deep cup of the foxglove, honeysuckle, and other flowers. I fancied then that they had stupified themselves with too much of the luscious, and perhaps narcotic juices of such flowers; but now I understand that it was the coming torpidity of death, accelerated probably by the chill of the air, and the approaching wintry blasts. But how do the queen-mothers spend the winter?'

'Sometimes they take shelter in the interior of their nests, where they sleep in a dormant and inactive state, but as frequently they retire into the first hole or crevice which they can select, such as in old stone or turf walls, or about the roots of trees, or among the moss below large stones; and in this condition they remain till spring, when, aroused by the first warm and sunny breath of that genial season, they awake from their long slumbers. Each solitary queen-bee then, alone and unaided, sets about establishing her new colony; for this purpose she selects a proper nest, if it so happens that she has forsaken that of last year, or yielded it up to another companion. She then collects soft moss to line it, begins and forms a few cups for the reception of her eggs, and thus labours on, alone and unassisted, till she in time rears up a young colony around her. Having thus produced her offspring, and amply provided for them, she dies of a good old age in her second summer. The first young bees that are produced are the workers, which are thus early required to assist in the labours of the nest. These make their appearance in May or June; the small females are produced in August; and it is a singular circumstance that they again produce the males, and males only. As in the case of the hive-bees, the grubs that are intended for workers are fed with common fare; but those that are destined to become males and females, are fed with the purest honey, or sometimes with a mixture of honey and pollen. The males are not here an idle class, like the drones of the bee-hive, but join in the labours of the field and nest, assisting the workers, which are a most industrious race, and which take charge of, and nurse and feed the young bees, taking care that a certain equable warmth may be kept up in the nest. In the intervals of all this home labour, they seize every opportunity of a sunny day, ranging the fields in quest of the purest honey, and loading their thighs with the choicest pollen from the anthers of flowers.'

'What a lesson of industry, and mutual reliance, and affection does the inspection of the humble bees' nest afford,' we exclaimed as we reluctantly gave up the inspection of those creatures, 'though seen for the twentieth time!'

ARGUIN AND ITS VICTIMS.

Though discovered by the Portuguese four hundred years ago, and successively possessed by them, by the Dutch, and the French, the island of Arguin, adjacent to the western coast of Africa, was, till within a few months since, a perfect *terra incognita* to the English public. At that time circumstances of a distressing nature aroused attention to the subject; it being reported that several of our countrymen were held in captivity, and barbarously treated by the islanders. Among the most zealous advocates for the liberation of the unhappy captives was Captain Grover, whose name is so familiar to the public in connexion with the Bokhara victims. Through him we now learn some particulars respecting the island, its inhabitants, and our then suffering brethren—his information having been collected from Mr Northwood, commanding the barque *Margaret*, who was detained three weeks in captivity; from William Honey, who was kept eleven months a prisoner at Arguin, and in a neighbouring island; and from Mr Vaughan, commanding the merchant brig *Courier*.*

It appears, by the log of the brig Courier, that, on the 26th May 1844, the chief mate, Mr Wilson, was sent with three hands to take soundings near Arguin, and that, on approaching the shore, they saw some natives, among whom was a white man, who hailed them in English. This induced Mr Wilson to run his boat on shore, for the purpose of relieving his supposed countryman; but as he neared, the natives began to beat their captive with clubs, and it was not till the boat's muskets were levelled at their heads that they desisted, and took to their heels. The white man immediately made for the boat, and was taken on board the Courier. He stated that his name was Samuel Phillips, that he was a seaman belonging to the Margaret, of London, commanded by Captain Northwood, who, with a portion of the crew, was there in captivity, and subjected to the most cruel treatment by the natives.

Captain Vaughan immediately determined to release his fellow-countrymen by ransom, or otherwise; and therefore brought up his ship, and anchored on the west side of the island, in four and a-half fathoms water, about a mile from the shore. Four men then appeared on the beach, and made signs for them to land. This was not complied with; and on the following morning the Courier got under weigh, and proceeded to the south-west point of the island, anchoring again in five fathoms water. The chief mate then landed with six men, and were kindly received by the natives, who promised to bring down Captain Northwood and the other prisoners early next day, to be ransomed. At the appointed time the natives came to the beach with Mr Northwood, who waved his hat, and requested Captain Vaughan to send a boat ashore; and accordingly the mate was again despatched with six hands, and provided with a supply of tobacco and other things, to offer in exchange for the captives. The chief was, however, not satisfied with the proposed ransom; and Captain Northwood desired the men to return to the Courier, and request Captain Vaughan to send everything he could possibly spare. The latter, accordingly, gave his mate in addition three or four dozen handkerchiefs, and other articles, and the crew collected among themselves twenty-five shirts. These were all put in the long-boat, under the charge of Mr Wilson and his six hands, accompanied by the cutter, with five men, all well armed. Captain Vaughan gave positive orders that they were on no account to land, but to anchor near the shore, exhibit the articles they had brought, and only to allow two or three chiefs to approach them to treat. Unfortunately these orders were disregarded, and as the islanders appeared friendly, the whole party went on shore. Captain Vaughan, seeing from his ship that about forty natives were hastening to the beach, called loudly to Mr Wilson to return on board—an order which, although it was heard, was not attended to. The islanders, as Captain Vaughan expected, fired as soon as the party landed; and the only one who escaped was Mr Barrington Daines, the second mate, who succeeded in swimming off to the ship, although desperately wounded, having received two shots in the arm, and one in the side. Mr Wilson and two men were killed, while three were dangerously wounded. William Honey received two balls in the left arm, close to the shoulder. Being considered dead, he was, with Mr Wilson and the other two men, thrown into the sea; but, revived doubtless by the salt water, had contrived to crawl to land. Captain Vaughan having only two seamen and two landsmen left in his ship, and seeing that the Arguins were preparing to attack him, slipped his cable, and was reluctantly compelled to leave his countrymen to their wretched fate.

The wounded were now carried to a small hut, where their sufferings during the night were intense. The next day, however, Captain Northwood induced the natives to dress their wounds; and though the system of surgery was rude in the extreme, it proved efficient. Indeed all the men recovered, even those whose limbs, in Europe, would have been subjected to instant amputation. After a preliminary dressing, of a somewhat novel and not very delicate character, their wounds were the next day scraped with a common knife, and cauterized with the head of a red-hot nail. They were then washed with fish-oil, which gave great relief. The sufferings of Honey were dreadful; he was burned eighteen times, and eight pieces of the main bone of his arm came away. The wound in his breast they cut out with an instrument, resembling in shape a blacksmith's shovel, while they forced out the balls with brass rods. John M'Donald received three balls in the abdomen, two very severe sabre cuts on the head, by which his skull was fractured. His head and skull were scraped with a common knife twice a-day. Strange to say, the sufferings of these men seemed to afford great amusement to the women and children, who imitated their moans and cries. However, they all recovered, though, during the eleven months of their cap-

* Arguin, which has been successively a trading post of the Portuguese, Dutch, and French, and finally abandoned by the latter, with the view to the concentration of the trade at their factory on the Senegal, is situated in 20 degrees 27 minutes north, and 16 degrees 37 minutes west. It is between thirty and forty miles long, and about one mile wide. It is about eight miles from the mainland (west coast of Africa), between which and the island the water is shallow. There are three or four channels, the main having a depth of five feet. On the outer or seaward side there is, according to the positive assurance of Captains Northwood and Vaughan, and of W. Honey, from five to seven fathoms water close in-shore; a fact which is, moreover, attested by a person in Bathurst, and signed by Lloyd's agent. This is important, as a different opinion has been entertained. The island is of a whitish rock, covered with a constantly shifting sand. The northern portion is flat, but the southern rises to an elevation which admits of its being seen at a distance of thirty miles. The soil produces no wood but a small shrub, yielding a caustic juice applied medicinally by the natives. Fuel is brought to the island from a place fifty miles in the interior of the continent. Water is abundant and excellent, though it has the appearance of milk. Two fairs are held annually on the island, in June and December; many strangers from a distance frequent them, bringing for barter necklaces, beads, cloths, and tobacco, for which they receive dried fish and oil.

The inhabitants are about sixty in number, including women and children. Their only food is fish and fish-oil: they have neither bread nor vegetables, except a small portion of rice, which is reserved for the sick. These people are remarkably affectionate to their children, and seldom quarrel among themselves. They are strict Mohammedans in all things but their ablutions, which they neglect. The people are tall and well-proportioned, and their dress simple. They go armed with musket, dagger, and scimitar; and possess six boats, including those captured from the British. The only quadrupeds on the island, exclusive of dogs and cats, are white rats. The heat is very great, though generally tempered by a breeze from the north-east; and healthiness appears to be characteristic of the island.

tivity, their only food was fish; and they were often kept a considerable time without water, although there was abundance of it. Even the women, who among the most savage tribes show almost always some sign of compassion, appeared to take delight in their sufferings, and the little children pelted them with stones. To add to their miseries, they were in daily expectation of being sent to the mainland, and sold to perpetual slavery.

There was, however, one person who had heard of their captivity, and who was taking active measures for their deliverance; namely, Captain Isemonger, commanding the merchant brig Africanus, who happened fortunately to be on the coast. This gentleman possesses great influence on that part of the coast of Africa; and, on communicating the intelligence to the king of Trazars, who is very friendly to the English, this monarch immediately sent to Arguin, ordering the restoration of the captives, or threatening to send an expedition to destroy the whole tribe. Captain Northwood, and all his men who could be moved, were accordingly placed in an old fishing-boat, escorted by ten of the natives, and, after a painful voyage of nine days, were delivered over to the gallant Isemonger. Honey and his two wounded companions were left behind, and Captain Northwood did not then think there was the least chance they would survive their sufferings. However, through the exertions of the man who effected the deliverance of all, these wounded men were ordered to be delivered up, without ransom, to any European ship that would receive them. No vessel appearing to claim them, despite the efforts made at home for that purpose, they were, after eleven months of great suffering, conveyed by the Arguins themselves to the Gambia. It must appear extraordinary that these men should have been allowed to remain eleven months in this dreadful state, within eight days' run of our shore. Despite the efforts of the owners to induce government to act, some misapprehension seemed to exist; for, in reply to the urgent intreaties of the mother of William Honey, the secretary of state forwarded an extract from a despatch written by Captain Bosanquet, commanding her majesty's ship Alert, which states that he had communicated with one of the chiefs of Arguin, who 'stated that the three Englishmen had died of their wounds, and that they had no white prisoners.' This despatch is dated 7th November 1844, and the men were not liberated until the 1st May 1845. They arrived in London on the 3d of August. It is most unfortunate that this report should have been fully credited, as, but for the benevolent and patriotic exertions of Captain Isemonger, they would have lingered out their wretched lives upon the island.

LITERARY IMPOSITIONS.

The Count Mariano Alberti sold to a bookseller at Ancona several unedited manuscripts of Tasso, some of which he interpolated, and others forged. In 1827, he declared himself in possession of two till then unknown poems in Tasso's handwriting; afterwards he produced four other autographs; and then a volume containing thirty-seven poems, which he offered for sale to the Duke of Tuscany, whose agents, however, declared them to be spurious and modern. He then produced a file of Tasso's letters, which were regarded as genuine; till, in 1841, when, on his property being sequestered, the whole affair proved a tissue of almost unexampled forgery.

The literary world is now very generally of the belief that that very beautiful poem, John Chalkhill's Thealma and Clearchus, first published by Isaac Walton (1683), was actually the production of that honest angler.

The copies of the 'English Mercurie' (regarded as the earliest English newspaper) in the British Museum, have been discovered to be forgeries, and Chatterton is supposed to have been concerned in their fabrication.

At least a hundred volumes or pamphlets, besides innumerable essays and letters in magazines or newspapers, have been written with a view to dispel the mystery in which for eighty years the authorship of Junius's Letters has been involved. These political letters, so remarkable for the combination of keen severity with a polished and brilliant style, were contributed to the 'Public Advertiser,' during three years, under the signature of Junius, the actual name of the writer being a secret even to the publisher of that paper. They have been fathered upon Earl Temple, Lord Sackville, Sir Philip Francis, and fifty other distinguished characters. At present, an attempt is again being made to prove them the productions of Mr Lauchan Maclean; but we need scarcely wish for anything like a positive or convincing result.

Some time before his death, Voltaire showed a perfect indifference for his own works: they were continually reprinting, without his being ever acquainted with it. If an edition of the 'Henriade,' or his tragedies, or his historical or fugitive pieces, was nearly sold off, another was instantly produced. He requested them not to print so many. They persisted, and reprinted them in a hurry without consulting him; and, what is almost incredible, yet true, they printed a magnificent quarto edition at Geneva without his seeing a single page; in which they inserted a number of pieces not written by him, the real authors of which were well known. His remark upon this occasion is very striking—'I look upon myself as a dead man, whose effects are upon sale.' The mayor of Lausanne having established a press, published in that town an edition called complete, with the word London on the title-page, containing a great number of dull and contemptible little pieces in prose and verse, transplanted from the works of Madame Oudot, the 'Almanacs of the Muses,' the 'Portfolio Recovered,' and other literary trash, of which the twenty-third volume contains the greatest abundance. Yet the editors had the effrontery to proclaim on the title-page that the book was wholly revised and corrected by the author, who had not seen a single page of it. In Holland some forgeries were printed as the 'Private Letters' of Voltaire, which induced him to parody an old epigram:—

> Lo! then exposed to public sight,
> My private letters see the light;
> So private, that none ever read 'em,
> Save they who printed, and who made 'em.

Steevens says, that 'not the smallest part of the work called Cibber's "Lives of the Poets" was the composition of Cibber, being entirely written by Mr Shiells, amanuensis to Dr Johnson, when his dictionary was preparing for the press. T. Cibber was in the King's Bench, and accepted of ten guineas from the booksellers for leave to prefix his name to the work; and it was purposely so prefixed, as to leave the reader in doubt whether himself or his father was the person designed.'

William Henry Ireland having exercised his ingenuity with some success in the imitation of ancient writing, passed off some forged papers as the genuine manuscripts of Shakspeare. Some of the many persons who were deceived by the imposition, subscribed sums of money to defray the publication of these spurious documents, which were accordingly issued in a handsome folio volume. But when Ireland's play of 'Vortigern' was performed at Drury Lane as the work of Shakspeare, the audience quickly discerned the cheat; and soon afterwards the clever impostor published his 'Confessions,' acknowledging himself to be the sole author and writer of these ancient-looking manuscripts.

Poor young Chatterton's forgery of the poems of Rowley, a priest of the fifteenth century, is one of the most celebrated literary impositions on record. Horace Walpole, in a letter written in 1777, says, 'Change the old words for modern, and the whole construction is of yesterday; but I have no objection to anybody believing what he pleases. I think poor Chatterton was an astonishing genius.'

In all probability the exact nature of Macpherson's connexion with what are called 'Ossian's Poems' will never be known. Although snatches of these poems, and of others like them, are *proved* to have existed from old times in the Highlands, there is no proof that the whole existed. Macpherson left what he called the original Gaelic poems to be published after his death; 'but,' says Mr Carruthers, 'they proved to be *an exact counterpart* of those in English, although, in one of the earlier Ossian publications, he had acknowledged taking liberties in the translation. Nothing more seems to be necessary to settle that the book must be regarded as to some unknown extent a modern production, founded upon, and imitative of, certain ancient poems; and this seems to be nearly the decision at which the judgment of the unprejudiced public has arrived.'

A species of literary imposition has become common latterly, namely, placing the name of some distinguished man on the title-page as editor of a work the author of which is not mentioned, because obscure. This system, done with a view to allure buyers, is unjust towards the concealed author, if the work really merit the support of an eminent editor, for it is denying a man the fair fame that he ought to receive; and if the work be bad, the public is cheated by the distinguished name put forth as editor and guarantee of its merits. Still, however, the tardiness of the people themselves in encouraging new and unknown writers of merit, is the reason why publishers resort to this trick to insure a sale and profit.

Several ingenious deceptions have been played off upon geologists and antiquaries. Some youths, desirous of amusing themselves at the expense of Father Kircher, engraved several fantastic figures upon a stone, which they afterwards buried in a place where a house was about to be built. The workmen having picked up the stone while digging the foundation, handed it over to the learned Kircher, who was quite delighted with it, and bestowed much labour and research in explaining the meaning of the extraordinary figures upon it. The success of this trick induced a young man at Wurzburg, of the name of Rodrick, to practise a more serious deception upon Professor Berenger, at the commencement of the last century. Rodrick cut a great number of stones into the shape of different kinds of animals and monstrous forms, such as bats with the heads and wings of butterflies, flying frogs and crabs, with Hebrew characters here and there discernible about the surface. These fabrications were gladly purchased by the professor, who encouraged the search for more. A new supply was accordingly prepared, and boys were employed to take them to the professor, pretending that they had just found them near the village of Eibelstadt, and charging him dearly for the time which they alleged they had employed in collecting them. Having expressed a desire to visit the place where these wonders had been found, the boys conducted him to a locality where they had previously buried a number of specimens. At last, when he had formed an ample collection, he published a folio volume, containing twenty-eight plates, with a Latin text explanatory of them, dedicating the volume to the Prince-Bishop of Wurzburg. The opinions expressed in this book, and the strange manner in which they are defended, render it a curious evidence of the extravagant credulity and folly of its author, who meant to follow it up with other publications; but being apprised by M. Deckard, a brother professor, of the hoax that had been practised, the deluded author became most anxious to recall his work. It is therefore very rare, being only met with in the libraries of the curious; and the copies which the publisher sold after the author's death, have a new title-page in lieu of the absurd allegorical one which originally belonged to them.

ISLAND AND TOWN OF SINCAPORE.

I could say much of Sincapore, for it is the pivot of the liberal system in the Indian Archipelago, and owes its prosperity to the enlightened measures of Sir Stamford Raffles. The situation is happily chosen, the climate healthy, the commerce unshackled, and the taxation light; and these advantages have attracted the vessels of all the neighbouring nations to bring their produce to this market, in order to exchange it for the manufactures of England. The extent of the island is about twenty-seven miles in length by eleven in breadth. The town stands on the south side, facing the shores of Battam, and is intersected by a salt-water stream, which separates the native town from the pleasant residences of the European inhabitants; the latter stretch along the beach, and cover a space which extends to the foot of a slight eminence on which stands the governor's house. Off the town lie the shipping of various countries, presenting a most picturesque and striking appearance. The man-of-war, the steamer, and the merchant vessels of the civilised world, contrast with the huge, misshapen, and bedizened arks of China. The awkward prahus of the Bugis are surrounded by the light boats of the island. The semi-civilised Cochin-Chinese, with their vessels of antiquated European construction, deserve attention from this important step towards improvement; and the rude prahus of some parts of Borneo, claim it from their exhibiting the early dawn of maritime adventure.—*Brooke's Journal in Borneo.*

A HYMN.

[FROM LAMARTINE'S 'HARMONIES POETIQUES.']

THERE is an unknown language spoken
By the loud winds that sweep the sky;
By the dark storm-clouds, thunder-broken,
And waves on rocks that dash and die;
By the lone star, whose beams wax pale,
The moonlight sleeping on the vale,
The mariner's sweet distant hymn,
The horizon that before us flies,
The crystal firmament that lies
In the smooth sea reflected dim.

'Tis breathed by the cool streams at morning,
The sunset on the mountain's shades,
The snow that daybreak is adorning,
And eve that on the turret fades;
The city's sounds that rise and sink,
The fair swan on the river's brink,
The quivering cypress' murmured sighs,
The ancient temple on the hill,
The solemn silence, deep and still,
Within the forest's mysteries.

Of Thee, oh God! this voice is telling,
Thou who art truth, life, hope, and love;
On whom night calls from her dark dwelling,
To whom bright morning looks above;
Of Thee—proclaimed by every sound,
Whom nature's all-mysterious round
Declares, yet not defines Thy light;
Of Thee—the abyss and source, whence all
Our souls proceed, in which they fall,
Who hast but one name—INFINITE.

All men on earth may hear and treasure
This voice, resounding from all time;
Each one, according to his measure
Interpreting its sense sublime.
But ah! the more our spirits weak
Within its holy depths would seek,
The more this vain world's pleasures cloy;
A weight too great for earthly mind,
O'erwhelms its powers, until we find
In solitude our only joy.

So when the feeble eye-ball fixes
Its sight upon the glorious sun,
Whose gold-emblazoned chariot mixes
With rosy clouds that towards it run;
The dazzled gaze all powerless sinks,
Blind with the radiance which it drinks,
And sees but gloomy specks float by;
And darkness indistinct o'ershade
Wood, meadow, hill, and pleasant glade,
And the clear bosom of the sky.

D. M. M.

RIGHT IN THE LONG-RUN.

Mankind do sooner or later make a 'good report' of things worthy to be so reported of. The world is long sometimes in estimating merit rightly, but is pretty sure in the end to accord its approbation to the deserving. Too often, it is true, the wreaths that ought to have encircled the brows of *living* men—the eminent of their race for mental and virtuous attainments—have been twined only for their *monumental effigies*; but once placed on these, they have preserved an imperishable freshness. Milton's bays grow greener with the touch of time. Newton's name shines like the stars with which, while he was upon earth, he held immortal converse. Nature spoke by Shakspeare when he lived, and mankind have since taken care that she shall speak by him for ever. Whence we may fairly infer that the world's ultimate judgment is in most things correct, and should be regarded by every man of sense accordingly.—*T. Cromwell.*

NOTICE.

UNSPOKEN LANGUAGE.

It is remarkable that, while the grammar of our spoken tongue is taught in untold thousands of academies, there is no institution of any kind for instruction in that equally useful language which is neither written nor spoken. There seems to be no good reason why this kind of language should not be taught in a systematic and—so to speak—grammatical manner; for, if it may be said that it comes naturally to us all, so, it may be said, does the employment of our mother tongue; and yet, as everybody knows, we cannot use that correctly without training. I would therefore humbly suggest the introduction into our principal schools and colleges of departments for the various leading branches of wordless speech, all of them under competent masters and mistresses, as the case might be.

An important department would be the various means of expressing anger, indignation, contempt, and other strong passions in the wordless manner. It ought to comprise classes for individuals of various sexes and ages. For example, there might be one composed of young ladies, to teach them the proper methods of showing how much they are offended, from a sulky look for an unreasonable papa or mamma, to a contemptuous toss of disdain for a swain who has made a non-reverential remark. It would be of particular consequence to train them to the art of cutting, for which purpose it might be necessary to set up a figure like the quintal of the tournament-ground, upon which to practise the desired art. Past this they would be paraded at a proper walking pace, and taught to look at it as if they did not see it, or know what it was. Cutting, we should think, might be taught to clever pupils in from four to six lessons.

The most expressive methods of slamming doors would form the business of a general class; for this is a form of silent, though not noiseless rhetoric, for which almost all have occasion. Doors may be slammed in a great variety of ways, each having its own peculiar signification. For instance, there is the sulky slam—a heavy dull mode, yet necessary for its own particular shade of feeling. There is also the pert, contemptuous slam—a sharp snappish sound, which seems to say, 'I despise you.' Then there is the thundering slam, for towering passions only, and which generally shakes the whole tenement from garret to cellar. On all of these, and other slams, there would of course be sub-variations for various parties. For example, a servant's angry slam against a mistress who has been so unreasonable as point out a fault; a son's slam against his father on being refused a horse; &c. When all the varieties of the art are considered, we could not expect that, in private tuition, slamming could be well taught in less than twelve lessons.

An important department would be that for teaching the various means of expressing derogatory opinions of friends and acquaintance independently of words. The utility of the non-verbal language is here so great, that all must be sensible of it. Particular care would be necessary in the selection of teachers, particularly those who had to train young commercial men in the methods of indicating degrees of credit-worthiness; and those, again, of the female sex who gave instructions in the best modes of denoting the state of reputations. The nicest caution and delicacy being here necessary, it would be proper to engage only first-rate talent, and to pay it extremely well. We can imagine the class-rooms for this department presenting curious scenes. Nods, winks, elevations of the eyebrows, shrugs, affectedly-concerned looks, would be seen passing between teachers and pupils in a surprising manner. A master might be seen giving lessons in the laying of a finger significantly across the lips, for half an hour at a time. A spectator unacquainted with the object would be apt to suppose the class a congregation of lunatics, when, in reality, it was engaged in preparation for some of the most important duties of social life. This allusion, by the way, reminds us of one of the things to be taught in this department; namely, the proper way of referring without words to the various degrees of sanity enjoyed by one's friends—from that movement of shoulders and eyebrows which expresses a sense of their oddity, to the pointings to, and touchings of, the forehead, by which we indicate their being hopelessly gone in madness, or, what is thought the same thing, the knowledge and goodness which soar above the common world.

One good end might be in a special manner served by the proposed institutions, and one which would, in fact, make up for the shortcomings of all other seminaries, and the obstructions to all other means of acquiring knowledge. It often happens, as every one knows, that people speak of things which none but themselves understand. What are the rest to do?—to acknowledge ignorance, and profess to be willing to learn? This were such a degradation, as none possessed of a fair share of self-respect could submit to. The alternative, of course, is to listen with that appearance of intelligence usually called a 'knowing look.' But this is called for in many various forms. For example, if a friend quotes from a Latin or French author, there is required an aspect which seems to say—'Right: you have it—the thing is undeniable.' Suppose, again, you are at an exhibition of pictures, and join a pair of friends who are talking learnedly of keeping—light and shade—colouring—tone—aërial perspective—scumbling—old woman in the red cloak to give effect to the foliage—about all of which matters you feel like a child unborn, as far as the feelings of such a member of

society may be guessed at—then you will require to light up your countenance with a different kind of internal lantern. A much graver, more solemn light, it must be; consisting of a decided earnestness of eye, a primness of lips; a few firm, shrewd, sidelong glances; two nods judiciously interspersed; and finally, a toss up of the chin as you stalk away, without a single word, to the next picture, apparently determined on criticising and judging for yourself. Looks for non-understood papers at scientific societies are not less needful; for at present many grown gentlemen hardly know how to conduct themselves on those occasions. Such looks would require to be duly graduated to the character of the various papers—from a trivial, half-attentive look for speculations in geology and other such readily-apprehensible matters, to one fixed, penetrating, and determined, when the black board was getting covered over with algebraic calculations. In this department it would be well to have private hours for the more special instruction of presidents, councillors, and other officials, as it becomes particularly absurd to see the gentlemen at the green table looking as if they had not the faintest idea of what the matter is all about.

There would be a large miscellaneous department, absorbing many odds and ends. Here one might be duly trained to the silent methods of maintaining an appearance of consequence—making people keep their distance, and so forth. A stare in reply to an over-familiar remark is a piece of art which would require a good deal of practice for most persons, as, to do human nature justice, we do not naturally feel jealous about dignity—witness the proceedings of children—and only acquire the sentiment in our intercourse with society. Connected with such lessons are those required for recognitions in streets and other public places—the cool nod for a friend who borrows, the *impressé* bow for the lady who gives nice parties, the mixture of nonchalance and perfect politeness to be conveyed to one whom you suppose to be an enemy or rival, so as to leave him nothing of which either to boast or complain. To chill down and battle off bores by mere mute dodging—to turn the cold shoulder in an unchallengeable manner to persons 'not proper'—would also call for much study. All of these are utterances of a most refined nature, compared to which word-language is a piece of the grossest materiality. Decayed members of the upper classes would probably be found the only persons competent to teach such niceties. Here, also, the various feelings expressible by a turn or cast of the eyes, by a look, a smile, a pursing-up or a turning down of the mouth, and many other little gesticulations, would be subject of exercise. We would not willingly see instructions given in those mysterious applications of the thumb to the nose, which have of late years been so common, as an expression of incredulity, seeing that this practice is essentially a degradation of the human countenance divine. A polite scepticism is doubtless expressible by gestures or looks against which no such objection can be urged; and to discover and teach these, would be the business of some of the higher officials of the establishment.

Such is a general outline of the kind of seminaries proposed—liable of course to revision in point of detail, and with regard to their constitution and management. We throw it out to the world only as a hint, leaving it to others to make it a reality.

P. S.—A friend, to whom we have read what is here written, remarks that he cannot understand how an academy for the teaching of silent arts would admit of any female teachers. This is mere matter of detail. Substitutes of the other sex, with all or most of the requisite qualifications, would doubtless be found.

CASTILLOTE.

The civil war in Navarre and the Basque provinces had been brought to a conclusion, at the close of the month of August 1839, by the memorable convention of Bergara. That welcome pacification was accomplished by the military genius, indomitable perseverance, and patriotic generosity of the Duke de la Victoria—Espartero; who, followed by the benedictions of the now happy population of the north of Spain, marched without delay, at the head of a large and brilliant army, to seek out the Carlist chief Cabrera in his strongholds in Lower Aragon, Valencia, and Catalonia.

Let us glance at the state of Lower Aragon at this period.

It was evident that the queen's forces were regarded by the inhabitants as being destined to release them from the tyranny of Cabrera and his reckless bands; and that, with the exception of those hordes of robbers and outcasts of society, and some fanatics, all—including vast numbers of the male population who had been dragged from their homes, and forced to take up arms in the Carlist ranks—detested the very name of Don Carlos and his ferocious agents.

If the queen's general and his army were not at first received with enthusiasm, the cause was speedily ascertained to be, that the people were still groaning under the weight of terror, lest—as had happened on former occasions—the Christinos should occupy portions of the country for a short time only, and that the slightest display of good-will towards them would expose the inhabitants to the most furious persecution after their departure. But when it was found that this army was under the command of a determined and high-minded chief, who had the means as well as the desire to protect them, and who proclaimed that he would not rest until he should have completely swept away the brigands who had overspread and ravaged the country for so many years; when they saw that, instead of levying contributions, he brought with him the needful supplies for his army, and paid in coin, or by orders on government, for whatever they might have to dispose of; that his officers and men, instead of being, as the Carlists had described them, brutal, almost cannibals, and bereft of religion, were humane, and in a high state of discipline; moreover, that on Sundays and the festivals of the church military mass was celebrated, often in the open fields; and that to all this were added social feelings towards the inhabitants in whose houses they were quartered, and that the men gaily assisted them in their agricultural labours when occasions offered—when the people saw this, they gave vent to their long-suppressed feelings, and rejoiced at the bright prospect of being speedily restored to that state of peace and security of which they had been so long bereaved.

Innumerable interesting reminiscences flash across my mind when reflecting on the stirring events which it was my lot to witness and participate in during this momentous period. As the Duke de la Victoria rode at the head of his staff through towns, villages, and hamlets, after traversing a bare and almost depopulated country, the people—men, women, and children—hailed him as their deliverer; the former grasping his hands, and the women shedding tears of joy; whilst the boys struggled to seize the bridle of his horse, and lead him in triumph. The male population applied for and obtained arms, in order to resist any rebels who might attempt to enter and pillage their towns and villages, declaring that now they would be responsible that no more outrages should be committed. As we advanced,

revolting instances were continually pointed out of the cruelty of Cabrera, who, on learning that Espartero was approaching at the head of his gallant army, became infuriated to the last degree. At the town of Muniesa, I was credibly informed that a Carlist colonel, said to have been Cabrera's secretary, having asked his chief, in conversation, how he thought all these things would terminate—'I'll show you,' replied the monster; and he instantly had the inquisitive colonel shot!

At the time I am speaking of—the autumn—the women were to be seen in the streets of Muniesa, sitting outside their doors on low stools, before small deal tables, picking the rich gold-coloured stamens from the beautiful blue crocus-like saffron flowers which were in baskets at their feet. Poor people! This azafran, or saffron, was the only produce which the Carlists had left them; and simply because it could not be carried off—for the process of culling the flowers from the azafranales, or fields where they are grown, and of picking and rendering the saffron fit for sale, is a tedious one; and it so happened that the flowers were not in a proper state for gathering when the Carlists decamped. The value of saffron had, however, become reduced to a mere trifle, in consequence of the civil war. Before that disastrous period, dealers were in the habit of arriving annually from Catalonia at gathering-time, and purchasing the saffron crops at high prices, always paying for it in gold or silver coin; but this traffic had ceased for a long time. The men who cultivated the fields had been either forced to serve in the ranks of Cabrera's predatory force, or had fled to escape from so great a calamity; and the consequence was, that the quantity of saffron grown was insignificant in comparison with former and better times; and for the little that the poor people could scrape together, they were obliged to accept whatever price a stray Catalan or other casual purchaser chose to offer.

As the Carlists retired, they burnt the mills, cut off the water, and destroyed the miserable remnants of property still held by those whom they had so long lived upon and tormented. In short, plunder, fright, ruin, and the severance of all natural and social ties, were the palpable traces of those who boasted that they were the champions of royalty and the defenders of religion!

By the time that the duke had advanced as far as Las Parras, a small place within a short distance from Castillote, the season was too far advanced to admit of the needful preparations for the siege of that strong castle. The army was therefore cantoned in appropriate directions; and head-quarters were eventually established at a little town called Mas de las Matas. It was also fixed upon for the general depôt for provisions and military stores of every description.

This small country town is agreeably situated on the Guadalupe, and is surrounded by gardens, olive-plantations, groves of mulberry-trees—upon whose leaves are fed innumerable silk-worms—and pleasant fields. The bridge which spanned the river had been carried away by the floods, and it was of the utmost importance to get it speedily rebuilt, so that communications might at all times be kept up with the forces stationed on the other side of the Guadalupe, which, although it was now fordable, was sure to become swollen and impassable in the course of the winter.

The works, which were planned by the Duke de la Victoria himself, and carried forward under his personal direction, were therefore immediately commenced; and a new and substantial bridge was in due time completed, to the great joy of the inhabitants. The town was enclosed with tapias, or mud-walls, and fortified also under the general's own eye, and according to his plans. The large and handsome church was fixed upon for the reception of the immense supplies of provisions sent from Zaragoza, and even from Madrid, by that route. The entrance to the church was defended by a strong loopholed outwork, and a trench was dug round the edifice.

All these preparations proved to the inhabitants that the duke was in earnest. The roads were repaired, in order that the large convoys which were constantly arriving, under strong escorts, might perform their journeys with all possible rapidity; and communications were insured between all the places garrisoned and fortified by the queen's troops.

The winter had scarcely approached to its conclusion, when Espartero marched from Mas de las Matas to attack the strong castle of Segura, under every disadvantage in point of weather and other obstacles. By his vigorous proceedings, however, he forced the garrison to surrender at the end of three days, and thus relieved that part of the country from the scourge it had endured for some years. He gained at least two months' time by this energetic and successful attack; for, a very few days after the fall of Segura, the weather—which, during the operations, was inclement—set in with such extreme severity, with heavy falls of snow, that it would have been impossible to move the artillery forward.

In consequence of this early opening of his campaign, the Duke de la Victoria was enabled to enter at once upon the difficult enterprise of reducing the Carlist stronghold of Castillote in Lower Aragon; and he commenced his operations with that energy and confidence of success which had marked the whole of his proceedings.

On our first arrival in the previous autumn, this formidable castle was carefully reconnoitred by the duke. It commanded the town of Castillote, which lies at the base of the lofty peak on which this castle—said to have been built in ancient times by the knights-templars—was perched. Looking at it from the village of Jaganta, beyond Las Parras, it appeared to be dovetailed into the jagged rocks from which its massive walls and turrets rose. But the castle assumed a different and always formidable aspect at every fresh point from which it was viewed. After the fall of Segura, the duke again reconnoitred it from every available position, watching it as a sportsman does his game. Sometimes the rock on which it stood appeared to be separated on all sides from spots where artillery could be advantageously planted.

It was now about the middle of March, and the weather turned decidedly against us, commencing with heavy rains, which rendered the always bad, and now newly-repaired roads nearly impassable for the heavy artillery which had been collected at Muniesa; but by dint of indefatigable exertions, it was conveyed to Ejulve by a circuitous route, passing by Andorra. Head-quarters marched, by rugged mountainous paths, to the same point. We left a place called La Mata one morning at seven o'clock, in very rough weather; and on arriving at Ejulve, a ruined and deserted village, the general found that the artillery had, in conformity with his orders, already moved in the direction of Castillote, protected by a competent force.

Passing on, the duke halted at about four in the afternoon on a bleak naked height, without shelter of any kind, the piercing wind blowing a hurricane. On this inhospitable spot, however, we were destined to pass one of the severest nights I remember. The army encamped, or rather bivouacked there; Espartero, as usual, taking a soldier's full share in every toil and privation.

Soon after daybreak the duke mounted on horseback, and, accompanied by a portion of his staff, ascended some very steep and rugged heights, from whose ridge a clear view of the castle of Castillote was attained. The wind still blew with great violence, and it was with much difficulty that our horses could stand against it, perched as we were on those giddy peaks. The general remained for some time reconnoitring the ground, and we then descended, almost benumbed with cold, and arrived by precipitous paths at a valley not very distant from the town. From the castle—high above it—there was a covert-way, through a dip or ravine, to a strong redoubt, which appeared to be crowded with Carlist

troops; and from the highest tower of the formidable castle itself a black flag was floating, signifying that the garrison were resolved to defend their post unto the death. There were two sentinels at the gate of the town, which was surrounded with walls of weak construction, and appeared to be deserted.

The general carefully reconnoitred the ground in this direction, and ordered the *batéria rodada*, consisting of light field-pieces, which were carried on the backs of mules—the gun on one mule, and the wheeled carriage on another—to be brought over the rugged ground. It was extremely difficult to find proper spots for establishing large batteries sufficiently nigh to the castle to be efficiently employed; but here and there the general discovered positions where he could place smaller ones.

The army followed in the track of its leader, and a large force bivouacked that night in the vicinity. An extensive olive-plantation afforded a convenient site for a portion of the troops, and shortly after nightfall the camp-fires enlivened the scene. Our tent was pitched on a patch of ground overlooking the encampment, and not far from a large marquee occupied by some officers of the staff. A cottage, or rather hovel, afforded shelter to our gallant general. In the course of the evening I wandered about the camp, and gossipped with my numerous military friends; admiring, as I had often done before, the patience and cheerfulness of the Spanish soldiers, whose gallantry and military virtues of every description I had so repeatedly witnessed, and to whom I was strongly attached; for I had for some years been a participator in their vicissitudes.

In the early part of the following day two sixteen-pounders were placed in battery, at a considerable distance, however, from the castle; upon which they opened their fire, but with little effect. In the course of the day a small chapel or hermitage, which had been occupied by the enemy, and which was much nearer to the castle, and in a more favourable position, was taken possession of without resistance; and the town was afterwards entered with very little loss, though a sharp fire was kept up from the castle as the queen's forces approached the walls.

To enter a large and once flourishing town, and find it bereft of its population, through fear or coercion, is most afflicting—more so than when the people have voluntarily abandoned their homes on the approach of an invading army; because, in the latter case, the halo of patriotism sanctifies the self-sacrifice. In Castillote were to be seen good houses devoid of anything portable, yet having fixtures and decorations which denoted that the owners were persons of refined tastes and habits, who in all probability only sighed, like their humbler neighbours, for peace and protection; churches without priests; altars stripped of their adornments; the municipal halls deserted, and public documents strewn about the offices and staircases; while a formidable fortress, frowning from aloft on the devoted town, threatened to reduce it to ruins, now that the deserted streets were becoming filled with the troops of the attacking party.

And all this misery was brought about by the deceptive and ruffianly conduct of Cabrera and his followers, who had not even the pretext of fanaticism to colour their misdeeds, inasmuch as the people had no sympathy for Don Carlos or his cause.

About midnight a great body of flame, quickened by the howling wind, rose from the redoubt to the right. The Carlists had set fire to all the combustible portions of the work, which they abandoned, the garrison retiring by the covert-way to the castle. In the course of the night, the height and what remained of the redoubt were taken possession of, and five sixteen-pounders were conveyed through the town. Great and successful exertions were made to get them placed in battery by a very early hour in the morning near the before-mentioned chapel. Three twelve-pounders were also placed in battery on another suitable spot. The height and peculiar position of the castle—there being no commanding point from which it could be attacked, as the batteries were necessarily established full three hundred feet below, and at a distance of between five and six hundred yards from it—rendered the fortress an extremely difficult mark for guns, which, to act with effect, were fired at an elevation of about fifteen degrees.

Before commencing the attack, three summonses, by sound of trumpet, were made, to surrender the castle upon honourable terms—the duke's means of reducing it being stated, as well as his desire to avert bloodshed; but the only reply made by the Carlist governor was to cause the *ataque* to be sounded from the highest tower in defiance, and the aid-de-camp who was the bearer of the duke's message was fired upon.

Upon this the batteries instantly opened, under the personal direction of the duke, whose skill in artillery practice is one among his numerous high military qualities. The fire was very effective, and continued throughout the day. The outer defences of the fortress were much damaged, the parapets demolished, the works which protected the castle gate nearly destroyed, and the newly-constructed fortifications rendered useless and untenable. But the strong old castle stood firm amid the storm, though not a man appeared on its walls or battlements; and only a few musket-shots were now and then fired through the loopholes, doing but little damage.

In the early part of the day the Spanish flag floated on the highest and strongest tower; but it was afterwards blown away by the hurricane. Affixed to its broken staff, it started forth from the pinnacle as though it had been indignantly borne away from the rebels' tower by some invisible hand. The banner of Castile was saluted by the shotted cannon of its legitimate sovereign; and after being borne in a straight line away from the castle, it gradually descended, acknowledging, as it were, its allegiance, and it finally lodged among the rocks at the base of the castle. How the queen's soldiers vied with each other to catch it up! A few got caught in the interstices of the rugged rocks; others dropped down, wounded by stray bullets from the loopholes; but at last the banner was seized by two or three at one and the same time, and borne in triumph to the duke, who liberally rewarded all who had striven for the honour of obtaining possession of the flag, which the general ordered to be immediately hoisted on the principal battery.

It appeared probable that the garrison had shut themselves up in the strongest tower, awaiting the succour which Cabrera, when he gave his orders for defending the castle to the uttermost, declared he would bring, and that he would annihilate the queen's army before their eyes.

Towards evening the drawbridge was completely destroyed by several well-directed shots from the sixteen-pounder battery, to which were added two twelve-pounders; still the massive walls of the castle itself stood firmly on their rocky foundation.

On the following morning, soon after daybreak, the batteries, augmented by two twenty-four-pound howitzers, opened, and the fire was vigorously directed upon a high and strong white tower, and upon the governor's quarters connected with the main and strongest tower. Nothing could be more perfect than the artillery-firing. The Carlists scarcely fired in return, until at about one in the afternoon, at the moment when their opponents were in the act of placing two eight-pounders in battery on the side of the hill, on the summit of which the redoubt, abandoned by the enemy, was situated. Then very sharp and well-directed discharges of musketry commenced from a half-ruined house to the right of the square white tower, and also from the chief tower. Several Carlist soldiers stationed themselves at the foot of the white tower, and, with great intrepidity, fired upon the large battery where the general was, after every discharge of cannon from it.

By and by the white tower, and all around it, showed, by the ruinous state of the masonry, how true had been the aim of more than twenty pieces of artillery directed

against them by the unerring eye of Espartero. Still the brave Carlists continued firing musketry from that and the stronger tower; and during the ensuing night they threw a number of handgrenades into the town: these, however, did but little mischief.

Seeing that the main tower of the castle was so strong, the duke gave orders that a mine should be made at its foot, for the purpose of blowing it up. Whilst the firing from the batteries was going on, therefore, the engineer officers examined the approaches to the foot of the tower; and this perilous service was performed with courage and intelligence. The Carlists, who were watching the proceedings from the top of the lofty building, fired upon the mining party, and a young officer of engineers of great merit was killed. Still the mining operations were continued perseveringly. The sappers carried a quantity of planks lengthwise, jutting out beyond their heads, and sloping down their backs; and as they advanced towards the foot of the tower, they were fired upon from its summit; and when they got still nearer, heavy stones were cast down upon them, killing several, and wounding and crushing many others. The brave fellows, however, were nothing daunted by this, and succeeded in planting their planks, two or three thick, slant-wise against the wall, so as to leave a space at the bottom for a sapper to work under this shelter. In a few hours an aperture, six feet in length and four in depth, was made by loosening and taking out some stones at the foot of the tower. This was the chamber of the mine; but it was not charged until the following day.

In the course of this day the Carlists threw a number of dead bodies over the parapets of the castle. It was a frightful sight. The corpses bounded from point to point, and at length, in divers ghastly attitudes, became transfixed among the jagged rocks. As a man was about to leave the parapet of the white tower, after casting one of his dead comrades over it, the fragments of a shell, which had burst over his head, struck and killed him. The poor fellow fell with half of his body drooping over the parapet, and we saw his blood streaming down and staining the wall. Such are the frightful sights which become almost familiar to those whose lot it is to be a spectator of, or perform a part on, the theatre of war!

In a valley on the other side of a river which flows at some distance from the town, we perceived a Carlist general officer, attended by three of his staff, watching the movements of the queen's general. We afterwards learned that this was one of Cabrera's chiefs, Llagostéra, who had eight Carlist battalions nigh at hand—though he did not show a single man to encourage the besieged. Watching the attack on the castle at a distance through a telescope, he was at first full of confidence, and declared that it was impregnable; and, knowing that it was well supplied with provisions for at least six months, he is reported to have said, 'Let Espartero fire away, he will gain no ground.' But when he saw the destructive effect of the well-served artillery, he retired in despair, exclaiming, 'We are lost!' and the brave garrison of the fortress of Castillote were left isolated and abandoned.

At daybreak on the fifth day the batteries again opened. By eight o'clock the governor's house was completely destroyed; and then the whole fire, from more than twenty pieces of artillery, was concentrated upon the massive castle, the upper part of which was reduced to a ruinous state. In the meantime the regiment of Luchana, which was always foremost at the post of danger, and the Princesa regiment, advanced gallantly up a precipitous track towards the gate and the broken drawbridge. A tremendous fire was opened upon them from the castle. Showers of handgrenades were thrown over the gates, killing a great number of men, and wounding many more. At the same time our batteries, directed with the utmost energy and skill by Espartero, opened their whole fire upon the castle in volleys; the shot and shells flying and curving over the heads of the gallant storming party, who, in spite of the shower of musketry and handgrenades to which they were exposed, fired rapidly in return; the men creeping separately up the precipitous pointed rocks, taking possession of the ruined house and tower, and placing themselves intrepidly before the broken drawbridge, immediately in front of the hottest fire from the besieged.

Whilst this deadly contest was in progress, the mine at the foot of the castle wall had been charged, and was about to be exploded. At this critical moment a white flag was hoisted on the great tower. It was a signal that the garrison surrendered at discretion. The duke instantly gave orders to cease firing; the matches, which were already raised to be applied to the loaded artillery, were cast on the ground; and the shrill trumpet sounded the halt to the brave troops who, perched on the rocks and ruins, were about to rush on to the assault. In less than a quarter of an hour they were grouped on the encumbered approaches to the castle, conversing amicably with those against whom they had just before been engaged in mortal strife, and who were leaning over the walls of their lately-beleaguered fortress. Shortly afterwards the colours of the Luchana regiment were seen floating on the highest tower, and were greeted with loud cheers and vivas from the rocks above and the batteries below, and re-echoed by the troops in arms all around.

After a short interval, the duke, followed by his staff, proceeded on foot towards the castle; but when little more than half-way up the steep winding path, our progress was impeded by heaps of stones and broken walls, and debris of all kinds, cast there by the deadly cannon-shot from the batteries below. Espartero sat down upon a piece of broken wall, and we all accommodated ourselves as well as we could amongst the ruins.

I well remember that our gallant leader's boots were burst at the sides, and that his feet were exposed to be cut by the sharp stones over which he had walked; and I could not help thinking, with indignant feelings, of the erroneous, not to say malicious, reports and inventions which had found their way to England and other countries with regard to an imaginary supineness on the part of this talented and gallant soldier and true patriot, when to my own certain knowledge, from hourly personal experience, he was ever indefatigably engaged either in forming long-foreseeing plans for counteracting those of his sovereign's enemies, or in energetic and daring personal action whilst carrying these well-laid plans into effect.

Before the general could enter the battered castle, it was necessary to remove a pile of large stones which had been heaped up inside the gate, not only to strengthen it, but to form an almost impenetrable barricade, after the thick timbers of the portal had been shivered to atoms by the shot and shell. This took some time; and then there was a yawning gap under where the drawbridge had been, but which, as before stated, had been destroyed by the admirably directed fire from our batteries. The Carlist soldiers then brought some beams from within, and forced the ends forward from their side as far as they could, whilst the Christino soldiers knelt on the opposite brink, and stretched forth their arms to catch at and drag them to a lodgment. Good-humoured jests passed between those who, so short a time previously, had been watching to get a shot at one another; and the lately-beleaguered Carlists were gaily lending helping hands to form a passage into a fortress for those whom they had striven so gallantly to keep out of it.

The footing was at length made secure, and the Carlist governor came forth. He was received with much kindness and soldierly frankness by the duke, who, after conversing with him for a short time, proceeded to inspect the remains of the castle. It was a heap of ruins, with the exception of some subterranean galleries where the provisions and ammunition were deposited, and some buildings on the side which was not exposed to the

fire, and where part of the garrison had sheltered themselves.

During the preceding night the governor and his men had exerted themselves indefatigably in repairing the serious damage done to the top of the main tower. Strong parapets had been made with heavy beams, and large sacks filled with flour; in short, the greatest credit was due to the governor for his bravery and energy, as well as to the troops he commanded. He defended his post like a good and faithful officer, until he was overwhelmed by an immense force, most ably commanded, and full of gallantry; and knowing that a mine was about to be sprung, the effect of which would be to bury the greater part of the garrison under the ruins of the castle, and render the survivors the victims of an assault, under such circumstances he acted as every military man ought to do—and surrendered. He did so to a just and generous enemy; and both himself and his men were treated with the utmost kindness and consideration. The wounded Carlists were carefully carried by their late antagonists to the military hospital which had been established in the town, and were attended by the surgeons in like manner with the wounded soldiers of the queen's army. They lay down side by side like brethren, cheering and consoling each other. The docility of the Spanish people, their susceptibility to kindness, and tendency to value frank generosity for its own sake, and to practise it with simplicity of heart, these, and other estimable qualities—among which shines conspicuously personal bravery—are among the characteristics of a people who, I believe, are little understood, and have often been unscrupulously misrepresented.

I had a little conversation with the Carlist governor, whose bearing was manly and soldier-like. He had been very recently appointed, and was no doubt placed in command of the castle on account of his bravery and decision of character. He told me that he had declared to the Carlist chief, Llagostéra, by whom he was appointed, that it would be advisable to abandon the castle, rather than expose the garrison to the consequences of an attack from so formidable a force as the Duke de la Victoria could bring against it. 'But,' said the gallant governor, 'I was ordered to defend the castle to the uttermost, and I did so until the moment when I saw that all were on the brink of destruction, and that those who had placed us in that strait had abandoned us to our fate.' He added, that his instructions were imperative to defend the castle to the last; and that, should he find that it must fall, he was to sally forth with the garrison, and cut their way through the besieging force. This was a further proof of Cabrera's reckless and ignoble character; inasmuch as, in the face of these orders, which implied that he or some of his chiefs would be at hand to draw off the attention of the queen's general, and facilitate the escape of the garrison, they were left without a chance of succour—the eight Carlist battalions, at the rebel chief Llagostéra's disposal, as before stated, not having even been posted on the distant hills to afford that slight encouragement to the garrison.

As for the prisoners, who were three hundred and seven in number, they unanimously offered to enter the queen's service, saying that they had been torn from their homes, or deceived; and they declared, in a manner which was a guarantee for their sincerity, that they would serve Queen Isabel faithfully.

The place having at length been completely evacuated, the mine at the foot of the principal tower was sprung one evening. The explosion produced the full effect which the general expected. A very large portion of the angle at the foot of the tower was blown away, laying bare the internal part of the wall; that is to say, the solid stone-facing was entirely destroyed, the heavy masonry rolling down the precipice with great noise. The walls were at least eight feet in thickness. Two days afterwards, seven more mines, containing in all four hundred pounds of gunpowder, were exploded, and the tower was effectually destroyed, to the great joy of the country people, who now came flocking in. In a military point of view, the destruction of the formidable castle of Castillote was of the greatest importance, but its moral effect was powerful and instantaneous. It relieved the country from cruelty and extortion; and it proved to those who were still in arms in the Carlist ranks, that however strong the fortresses or positions they occupied might be—however difficult of access, or however bravely defended—they must fall before the numerous, brave, and veteran army brought against them under the command of their gallant general-in-chief, who had conducted that difficult operation with so much skill and energy, superintending and directing all personally, thereby overcoming many serious obstacles, which a less talented, practical, and resolute chief might have considered to be insuperable.

With this well-earned prestige, and the army in high spirits, the duke, having left a proper force to protect the country thus liberated, marched on the following day to Mas de las Matas; whence he again moved, three days afterwards, to follow up his plans for investing and attacking the still more important fortress of Morella in the province of Valencia.

DR CARUS IN SCOTLAND.

In a former number we endeavoured, by means of quotations from his narrative, to elicit the opinion of Dr Carus respecting the English; we shall now try, by a similar method, to discover his estimate of Scotland and the Scotch. Passing from Carlisle to Hamilton Palace, by way of Gretna and Moffat, he certainly entered our country by no very inviting route, and, as if to make the dreariness more remarkable, it was on a wet and gloomy day. This was Sunday, the 21st of July; and when it is stated that the royal journey lay by Hamilton, Glasgow, Inverary, the isles of Staffa and Iona, down the Caledonian Canal to Inverness and Culloden, and from thence by Dunkeld, Perth, and Stirling, to Edinburgh, where it terminated on the 5th of August, it will be perceived that the doctor had but little time to form any very decided opinion. But time is of very little moment to such a mind: what he did see, he noted; and what he did not see, must of necessity be of the same character with what he had seen. Being a philosopher, he of course detects, as soon as he crosses the ideal line which separates the kingdoms, a marked difference in the appearance and character of the inhabitants; the reader need not therefore be surprised at the following description:—'Our entrance into Scotland was a very melancholy one—completely in unison with what is said of the Scotch character—"*Sombre Ecossais.*" During the whole drive of many miles, we looked in vain for a town, or even a considerable village. The stages at which we changed horses were generally a few solitary dwellings, or resembled very poor hamlets; whilst the whole district was for the most part barren and waste. . . . . The persons too whom we met on the roads, or saw in the houses or hamlets, were now of a very different build. They were for the most part large, coarse figures, with wide mouths, melancholy countenances, and projecting cheek-bones: the eye was destitute of fire, especially in the men, who were generally rolled up in a woollen plaid, drawn tight round their shoulders, and wore a flat ugly-looking black woollen cap on their heads. The figures of the women were somewhat better, and we had the additional advantage of seeing them dressed in their Sunday clothes—though no small number of them went barefooted.

'The country first began to show some signs of civilisation when we had passed about forty miles beyond the border. Trees then became more frequent, and the houses somewhat larger. The thick misty rain decreased, the temperature of the evening became warm, although the sky still remained cloudy. As we drew near to Hamilton in the increasing twilight, we saw bright glowing lights in the northern horizon, which

proved to be the distant reflection of the numerous iron-works in the neighbourhood of Glasgow. We now passed several considerable market-towns; which, however, present a melancholy and disagreeable appearance, with their long rows of one-storey houses, under a uniform line of roof.'

Amidst all this barrenness, and gloom, and desolation, the learned doctor enjoyed 'an elegant dinner, served upon the richest plate, in a splendid room, with numbers of ancestral portraits hung upon its walls,' in the ducal palace of Hamilton.

On visiting Glasgow, 'the most industrial of all the towns in Scotland,' the party, it seems, were quite as unlucky in the choice of an entrance as they were in that to the country itself. 'On our entrance, we passed through the dirtiest, poorest, and most smoky part of the lower town. The entrance from all quarters is disagreeable and offensive. The smoke was not merely coal smoke—the whole atmosphere was impregnated by exhalations from chemical and other manufactories, which sent forth smells and vapours almost suffocating. The houses are small and dirty; and the town filled with a population, many of whom were lounging at the doors or in the streets in rags; and there were incredible numbers of children, who ran after the carriages, uttering the most disgusting cries. This continued long. By degrees, however, the houses began to improve; but the well-known manufacturing tone of Manchester and Leeds still prevailed through all the streets, and in the appearance of the party-coloured thronging masses of the people.' These descriptions recall many of our own early impressions of 'the west country.' It should, however, have been stated by the traveller, that what he now saw of Scotland was analogous to the Potteries, or the country around Birmingham and Wolverhampton in England; and that even on this track—at Bothwell, and along the Clyde generally—there are beautiful and romantic scenes, which only require to be seen in tolerable weather to be enjoyed. We are glad to find Carus afterwards adverting to the beautiful and impressive parts of Glasgow, as well as its sordid suburbs.

Sweeping along the lochs, and over the mountains of Argyleshire, we soon find our travellers in the very heart of the Western Highlands. Here of course there were many remarkable things to notice:—'First, for the comfort of all travellers, the admirable roads must be mentioned with the highest commendation. What difficulties must a traveller have encountered in this country of inhospitable mountains half a century ago! But now we travel with heavy carriages and excellent horses, if previously ordered, at a quick trot over the hills and along the valleys, and at every post-station find an excellent inn. Secondly, with regard to the habitations and build of the people, it is to be observed that everything here is more and more characteristic. For the first time on this journey, particularly among boys and young men, we saw specimens of the naked legs and Scottish kilt, made of party-coloured woollen stuff. This national dress has been prohibited in Scotland for several decennia; and at first the people were so little disposed to wear the ordinary nether garments of the south, that, in order to comply with the letter of the law, they often carried them with them on a stick, instead of wearing them on their persons. In these poor districts, however, the ancient customs, as it appears, are preserved still, at least among the youth; and as the national dress in later times has become a matter of taste and fashion among the higher classes, it will again perhaps come to honour. The build of the people still continues to be characterised by the same traits which I have already mentioned on our entrance into Scotland; their poverty, however, is especially observable in the form and condition of their huts. The walls are thick, and roughly built of stones, heaped together almost without mortar, and the interstices stuffed up with moss; the roof is made of dried heath and straw; and the chimney is perched upon the summit somewhat like a bee-hive thickly laced and bound together with ropes; the smoke generally fills the house, and often issues from the windows, door, and various parts of the roof, at its pleasure. The roof itself is also for the most part fastened down with straw ropes, and loaded with stones, in order to prevent it from being stripped off by the wind.'

Staffa and Iona are next visited; and on board the steamer two blind fiddlers played 'all sorts of Scottish melodies,' many of which were so soft and full of pathos, that the strain brought tears to the eyes of the doctor. 'I felt my eyes filled with tears' is a vast admission from a connoisseur of Dr Carus's calibre, and the nation may therefore accept it as no ordinary compliment to the spirit of their music. Lest the reader should be anxious to know what airs so melted the susceptible German, he specifies the two which more particularly undid him. These were, 'My gloomy winter is gone,' and 'Rose's dream;' in which, we anticipate, no Scotchman will be at a loss to detect 'Gloomy winter's now awa,' and 'Rousseau's dream.' It is rather unlucky that the latter is no more Scotch than the last of Strauss's waltzes. Having found the music of the Scotch so melting, their character so melancholy, their lakes so gray, and their hills so misty, it is as clear as noonday that no people could endure life under such a concatenation of gloomy circumstances, had they not some antidote wherewith to dispel the vapours. This the doctor, with his usual acumen, discovers in Highland whisky. 'After dinner, the landlord brought in a bottle of genuine Scotch whisky; that nectar of Scotland, the preparation of which Landseer has represented in a *spirited* painting, well known from its numerous engravings. It is nothing but very strong corn brandy, strongly impregnated, however, with the characteristic smell of turf, which is to be found in all Scotch dwellings, and prepared in a somewhat peculiar way. A mixture of hot water, sugar, and some of this spirit, forms an agreeable beverage, which no doubt is very pleasant, and even beneficial, after a walk or any expedition in the misty moisture of these mountains. Even the otherwise disagreeable taste of turf gives a *piquant* character to the spirit. And, indeed, is it not remarkable that the extremes of the agreeable and the disagreeable are so nearly connected with each other? Pleasure and pain are often so closely connected, that an excess of pleasure becomes pain, and even a certain quantity of pain may produce pleasure. In the same way we find it with the very spiritual (intellectual) sense of taste, in which a certain aftertaste of what is disagreeable only serves to heighten the relish for the object. And this seems to be the case with this whisky.' It is well for Dr Carus that the king of Saxony's stay in the Highlands of Scotland was so brief. It is bad enough when a man takes to drinking for the liking of the thing, but alas for him when he begins to justify that liking by a show of philosophy and reason!

Waxing bold, we presume, through the influences of our Highland nectar, we next find the doctor performing a feat, the very conception of which in ordinary circumstances would have filled him with horror. Such, at least, would have been the case if we may judge from the terms in which he narrates the incident. 'Upon our return, in an old stage-coach that we had hired in Bannavie, I tried, for a short distance, the airy seat on the outside, where one really half hovers in the air. I had often seen these coaches, full inside and out, rush past us on the road, and had secretly wondered how not only men, but even women, could sit up there quite comfortably; and I therefore was glad to have this opportunity of trying it once myself. On good roads, the affair is not so dreadful as it appears; the view one thus obtains of the country is very pretty; and any person who does not suffer from giddiness, which might easily be caused by the swaying motion, would no doubt be very pleasantly situated.' Indeed the doctor seems altogether to get in better humour with the country as he sojourns in the

neighbourhood of Inverness. Kilravock Castle, with its inmates, delights him greatly. These were two ladies—mother and daughter—of the family of the Campbells, who, 'in the true spirit of English exclusiveness and separation, dwelt in this absolute solitude, and had taken a lease of the property from the owner for a number of years. The whole of the ornamental grounds around were their work. They had planted fruit-trees, and even sweet chestnuts; and the careful selection of the flowers and plants gave abundant evidence of refined female taste. There is something quite original in the interior of the house. In the drawing-room there were a number of vases and grotesque figures; books, music, and portfolios were lying around: there stood a pianoforte and a harp; and, in short, everything gave evidence of the favourite pursuits of two ladies who had travelled much—had traversed Italy, and the highest and most dangerous passes of the Swiss mountains and glaciers, and at that time were living in the enjoyment of a kind of philosophical retirement and literary occupation.' Again, those mountain regions, he begs his German friends to remember, are not so solitary as they appear to the mere traveller. 'Towards the close of the autumn, many of the valleys often become, for weeks long, the residence of rich lords and gentlemen, fond of the chase, who either amuse themselves in grouse-shooting or deer-stalking. Parties, during the season, take up their quarters in these shooting-boxes in the midst of the mountains, commit follies of all kinds, assume the Scotch costume, with kilt and dagger, drink, drive about in light carriages, drawn by Highland ponies, over the Alpine mountain-paths, and practise all the devices which youth and wealth, stimulated by pride and indolence, can suggest.' Even the misty sky, and the gloomy elements of the atmosphere, begin to improve, and seem to have got up an exhibition by way of redeeming their character; for one evening 'the moon rose splendidly from the golden clouds, into such a beautiful azure blue sky, and accompanied by such charming tones of colour in the clouds beneath, as I had not yet seen either in England, or hitherto in Scotland.'

By and by the party descend from the inhospitable heights of the Grampians, and soon find in the low districts 'an admirably well-cultivated country;' and ultimately 'the stately castle of the rich and powerful Marquis of Breadalbane, surrounded by beautiful lawns and magnificent groups of trees, presents itself to the eye. This castle is built in the richest modern Anglo-Gothic fortification style. It is gay and handsome, and had the yellow and black flag flying on the main tower. The noble owner received his majesty at the door of the castle, and, as we entered the hall, the cannons of the fort thundered forth a royal salute of twenty-one guns. His majesty and suite were conducted into the splendid reception-room, where the family were assembled, and then visited the noble hall, the walls of which are panelled with wood in the Gothic style. It has an air of antiquity, and is tastefully adorned with armour and banners. Other state-rooms adjoin the hall. The first greetings and observations being past, a walk was proposed through part of the park towards Loch Tay. On the way, we saw some really splendid specimens of lime-trees in flower, with their branches hanging to the ground; and proceeded through an alley of lofty and magnificent red beech, not less than three hundred years old, to an elevated point in the demesne, from which there is a charming view of the lake, surrounded by richly-wooded hills. Near this spot stands the dairy, fitted up not only with admirable neatness, but in the most ornamental manner. This small house, overgrown with wild roses, and adorned with lattices and ornaments of white quartz, is very charming. The basement floor contains the milk-room, in which the milk and cream, in large and handsome pans, are placed in running spring-water, while the upper storey contains some elegant rooms for breakfast or luncheon. We were scarcely returned to the castle when we were conducted to the dining-room, where a luncheon awaited us which might very well have served for a splendid dinner.'

With Taymouth Castle and its inhabitants Dr Carus seems to have been eminently delighted. Here he met Sir David Brewster, 'whose simplicity of nature and ability were so very agreeable;' Lord and Lady Ruthven, the Hon. Fox Maule, 'a humorous, sarcastic person;' and a young Campbell, nephew to the marquis, 'a genuine Highlander, always in the national costume, with his kilt, plaid, and Highland bonnet.' Here also he met with something new, in the shape of several large bisons, grazing on the smooth green grass, scarcely a hundred yards from the castle. 'Game of *this* kind I had never yet seen in any park; and the very fact of the Marquis of Breadalbane's having caused a number of these immense American oxen to be transported hither from the western prairies, for the purpose of furnishing a rare kind of ornament to his park, is in itself sufficient to enable my readers to judge of the magnificence of the demesne and the wealth of its owner.' Everything about the castle was indeed admirable, and quite to his liking, except the 'nasal thrilling tones of the piper,' and these were 'execrable.'

Having taken a hasty glance at Dunkeld, Perth, and Stirling, we next find the royal party in the agricultural museum of the Messrs Drummond at the latter place. This well-known exhibition opened up to our traveller a new theme for his philosophy, and for the first time in his existence he beheld agriculture, its modes and accessories, treated as a study and as a science. 'I had here,' says he, 'another opportunity of observing how much shorter is the path from theoretical improvements to actually practical ones in this nation than in ours. One reason, no doubt, is to be looked for in the fact of the non-existence here of a separate and exclusive race of agriculturists, and of the close connexion existing between the farmers and the inhabitants of cities, nay, even the landowners themselves. Among us it is still, notwithstanding the advantages afforded by the new societies, by no means an easy matter to bring into use among the tillers of the land any improvement or new method deduced from the discoveries of scientific men. The farmer considers himself a member of a different and distinct class: he holds fast to the traditions of his province: he considers the man of science, who pretends to teach him anything in his own branch, in the same light as that in which the artist regards the amateur—as a stranger pressing in where he has no business; and with difficulty, if at all, will he take advice proceeding from such a quarter. In England and Scotland, where no particular class of men devote themselves to agriculture in opposition to the inhabitant of the town, or to the man of science, all is different; and for this reason, every improvement discovered in theory by the scientific man is made to produce its proper effect in practice.' And now, when Dr Carus is at last in the Lowlands—that district which, for agriculture, mining, and manufactures, is unequalled by any other territory of the same extent in the world—what says he of it? Why, absolutely nothing: thus leaving the German public, for whom he has written, to form their conclusions respecting a whole country from his descriptions of its most bleak and desolate regions.

But the king of Saxony is hurrying on to his departure, and his attachés must take time and things just as they are presented. From Stirling they post to Edinburgh, taking Hopetoun House and Dalmahoy Castle in their way, his majesty becoming the guest of the noble owner of the latter domain. Here our traveller made acquaintance with a genuine Scotch breakfast; and a very pleasant acquaintance it seems to have been. 'The table was loaded with delicacies, as for a regular meal, with cold meat, fried fish, all sorts of pastry, eggs, ham, and besides these, honey and Scotch marmalade. This last is a preserve of strips of orange-

peel, and is eaten with bread and butter, which appears strange, but is really very good. The Scotch claim for themselves the rather equivocal honour of having invented this kind of luxurious breakfast, furnished with so many kinds of food, and of having introduced it into England. We soon became accustomed to it, however, and ate of the most various sorts of food without feeling any evil effects.' Having fortified himself after this fashion, he proceeds to examine and pronounce on the Scottish metropolis. The city pleases him vastly: 'it is quite a phenomenon in the scale of cities: everything appears original, great, and effective.' 'I did not think,' continues he, standing on the castle parapet, 'that there was a city which could kindle in me those feelings of enthusiasm which the sight of Edinburgh produced in my mind. I certainly consider Edinburgh the most beautiful and most interesting-looking city I know; Rome and Naples not excepted. The peculiar boldness and imaginativeness of the town is to me only another proof that reality may produce an effect exceeding even the boldest flights of fancy! We stood on the hill, beside the unwieldy iron cannon of the fifteenth century, and saw to the left the blue sea in its wide extent, studded with islands and ships of various sizes; in front, the Calton Hill, the second rocky height of the city, with its lofty monument, and the commencement of a Doric temple, which completes its resemblance to the Acropolis of Athens; and finally, to the right, the Old Town and the mountain, which is geologically remarkable for its considerable formations of trap, and is sometimes spoken of by the name of Arthur's Seat; sometimes, from its resemblance to a *lion couchant*, by that of the Scottish lion. All this presented a force and an effect of form rarely, perhaps nowhere else, to be found. When we further consider the prospect of the connexion between the old and the comparatively modern town by means of the enormous work of the North Bridge, the various Gothic churches, Heriot's Hospital, and the new monument to Sir Walter Scott, rising like an immense Gothic tabernacle, a panorama is produced such as does not exist anywhere else on earth.' After visiting Holyrood, the public courts, the college, museums, hospitals, and other public institutions, we find him descending into minor criticisms, condemning the monotonous architecture of the New Town, the awkward style of Holyrood, and, for the comfort of the phrenologists, significantly hinting that he found their collection 'in a narrow, dark street, and, curiously enough, under the care of an old woman!'

But our philosopher is not yet done with us. He had pronounced the English a set of hyper-puritans in the religious observance of the Sabbath; and he must set down the Presbyterian Scotch as something more intensely gloomy and bigoted. He cannot move about on Sunday but he fancies every eye is scowling upon him; and the 'short-sighted religious feelings' of the Scotch had taken the idea of the king of Saxony's departure on a Sunday so ill, that the matter had to be arranged very quietly, 'lest any public demonstration on the part of this very irritable nation had disturbed the close of our pleasant journey.' He is not, however, to condemn our puritanical notions on this point without proper evidence, and so to church he goes, armed, we presume, with pencil and portfolio. Unluckily for his *experimentum crucis*, he stumbles into an Episcopalian chapel, and to the service there the whole of his remarks apply, the while he fancies he is depicting to life the Presbyterian form of worship. This is fact; but would not have been worth observing, had it not been for the confident manner in which he pronounces on every subject and object which came under his notice, even for the most fleeting moment. And this, indeed, is the main error of his book—a confident generalisation from the most hasty and insufficient data. We have no doubt that every inhabitant of Saxony who reads the tour, will set the Scotch down as a nation of morning dram-drinkers; will believe that every dwelling is black with peat smoke; that our peasantry, without exception, live in turf hovels; that we are a set of bigots, ready to defend the observance of the Sabbath even by physical force; and that we are a race of coarse-figured, wide-mouthed, high cheek-boned, dull-eyed troglodytes. All this, and a great deal more, Scotland can treat with perfect patience.

CASTES.

The Portuguese applied the word *castas*, races (termed by the natives *varnas*, or colours), to the social divisions into which they found the Hindoo population distributed. Such division is of remote antiquity, and, as still exercising an important influence over millions of human beings, is well worthy of notice, especially as exaggerated and erroneous notions respecting it have long prevailed.

The origin of the institution is lost in fable. The only four pure castes which are acknowledged by the Hindoos are, in their traditions, said to have proceeded from different parts of the body of Brahma, according to their importance. 1st, The *Brahmins* (scripture) proceeded with the Veda from his mouth; 2d, the *Kshatriyas* (protection), or soldiers, from his arms; 3d, the *Vaisyas* (wealth), or merchants and husbandmen, from the thighs; 4th, the last and lowest class, the *Sudras* (labour), or artisans and labourers, from his feet. Besides these, many mixed or impure classes have originated from the intermarriages between the castes, and also from the degradation of those who, by crime, and sometimes trivial faults, have forfeited their privilege of appertaining to the pure caste. Still, to the several secondary castes are usually consigned various peculiar employments; some few, however, as that of a merchant or soldier, being open to all classes. Another important feature is, that the caste itself, as well as the employment attached to it, is hereditary; so that a man is by no means permitted to change or choose his occupation as circumstances or the bent of his genius may dictate, but must confine himself to the pursuit of that which his ancestors have been accustomed to follow.

The Brahmin caste, which furnishes the priesthood, stands pre-eminently first, and is fortified by such remarkable privileges, as could only have originated in those enjoying them having a direct interest in their bestowal. The Brahmin is the exclusive expounder of the law and possessor of knowledge. The most profound submission must be paid him: his deepest sins must be glossed over; while his malediction may entail injury on the gods themselves. Offerings to him are inculcated as a primary religious duty; and the rich can in nowise so well testify their gratitude to Providence, as in ministering to his support. From all tax or state contribution he is exempted. The *Institutes of Menu*, the sacred law-book of the Hindoos, contains numerous injunctions for honouring the Brahmins:—'Let the king, having risen at early dawn, attend to Brahmins learned in the three Vedas, and by their decision let him abide.... A Brahmin, learned or ignorant, is a powerful divinity.... Never shall the king slay a Brahmin, though convicted of all possible vices: let him banish the offender from his realm, but with all his property secure, and his person unhurt.' 'I have seen,' says Mr Ward, 'the poor besotted Sudra prostrate himself at the feet of the nearest Brahmin, and, raising his head, and closing his hands, exclaim, "You are my God!" At the same time the character of the Brahmin has been perhaps notorious for vice.' 'The Brahmin,' says the Abbé Dubois, 'lives but for himself. Bred in the belief that the whole world is his debtor, and that he himself is called upon to make no return, he conducts himself, in every circumstance of his life, with the most absolute selfishness. He will see an unhappy wretch perish on the road, or even at his own gate, if belonging to another caste, and will not stir to help him to a drop of water, though it were to save his life. He has been taught from his infancy to regard all other classes of

men with the utmost contempt, as beings created but for the purpose of serving him, and supplying all his wants; so that we must not be surprised at his haughtiness, self-love, and pride, or at his contempt for other men, of whom the Brahmins never speak among themselves without adding some ignominious epithet, or expression of scorn.'

So numerous a caste as that of the Brahmins could not hope for an equal share of power and prosperity; hence, to meet emergencies, they are allowed to employ themselves in the practice of the learned professions—as merchants, in tillage, to enlist as soldiers, or even to perform menial offices for wages. Although still much honoured in India, their influence has undergone a marked diminution; to which the prevalence of other sects, and of schisms among themselves, have greatly contributed. Of their present state, Professor Wilson, in his Notes to Mill's India, thus speaks:—'In modern times, the Brahmins, collectively, have lost all claim to the character of a priesthood. They form a nation following all kinds of secular avocations; and where they are met with in a religious capacity, it is not as Brahmins merely, but as being the ministers of temples, or the family gûrûs, or priests, of the lower classes of people—offices by no means restricted, though not unfrequently extended, to the Brahminical caste.'

The Kshatriyas, or soldier caste—probably from the peaceable disposition of the Hindoos—is said to have become extinct. It furnished the nominal sovereign; all real power being, however, lodged in the hands of the Brahmins. The Vaisyas do not require any particular notice. The three castes now mentioned were considered honourable, and as carefully to be distinguished from the Sudra, or lowest caste, which was considered degraded or infamous. All the other classes may become regenerated by the Veda; but the old Hindoo law condemned to death the Sudra who presumed to peruse it. He is to be considered as the servile attendant upon the other castes, especially upon the Brahmin, whom he is taught to look up to with a feeling little short of adoration. 'For contumelious language to a Brahmin, a Sudra must have an iron style, ten fingers long, thrust red-hot into his mouth; and for offering to give instruction to priests, hot oil must be poured into his mouth and ears.' The Sudra may follow various arts and employments besides those of a menial character—as carpentry, writing, trade, husbandry, &c. The Institutes are peremptory in directing the degradation of this caste. 'No collection of wealth must be made by a Sudra, even though he has the power, since a servile man who has amassed riches gives pain even to Brahmins. If a Sudra gives much and frequent molestation to a Brahmin, the magistrate shall put him to death. Let not a Brahmin give advice, nor what remains from his table, nor clarified butter, of which a part has been offered, nor let him give spiritual counsel to such a man, nor inform him of a legal expiation of his sin: surely he who declares the law to a servile man, and he who instructs him in the mode of expiating sin, sinks with that very man into the hell called Asamrreta.'

However the theoretical division into four castes may have been devised or desired by the original Hindoo legislators, the numerous provisions and injunctions concerning mixed and impure castes contained in the Institutes of Menu, composed several centuries before the Christian era, prove that, at a very early period, such restrictions were found impracticable; and thus, at the present day, the great mass of the Indian population belong to these impure castes. The offspring of intermarriages between persons of different classes belonged to the caste of neither parent, but entered into an impure caste, determined by the relative position in society which the parents held: further intermarriages between these impure castes produced other subdivisions; until the number of castes has become so multiplied and complex, that persons even who have resided in India for a long time are unacquainted with them all. There are, however, twelve well-known and defined impure castes, whence the others have proceeded. The Sanscrit authorities themselves are at variance as to the number of secondary castes; some being mentioned by one are omitted by another. They vary also in their enumeration of the various occupations attached to each of these. 'Besides,' says Mr Colebrooke, 'the particular occupation assigned to each of the mixed classes, they have the alternative of following that profession which regularly belongs to the class from whence they derive their origin on the maternal side. They are also permitted to subsist by any of the duties of a Sudra—by menial service, handicraft, commerce, or agriculture.' Many of these castes were, say the Hindoo laws, directed by one of the good kings to arts and manufactures—'thereby providing for the increased wants of society, and removing a pest from its surface.' The regulation of the marriages between these impure castes becomes a matter of great importance, and genealogy, on this account, is, among the Hindoos, a very favourite subject of study. 'The multiplicity of castes,' says Professor Wilson, 'is not the enactment of any code, though it may be remotely the effect. It is the work of the people, among the most degraded of whom prevails not the shame, but the pride of caste. The lowest native is no outcast; he has an acknowledged place in society; he is the member of a class; and he is invariably more retentive of the distinction than those above him.' The ranks of these impure castes are augmented also by all those who have become degraded, from any cause, from their proper class—who have, as it is termed, lost caste. Caste may be lost in many ways; as the eating forbidden food, or such as has been prepared by impure persons, or in improper places—as on shipboard; the drinking strong drinks, neglecting funeral ceremonies, the slaying of an animal of the cow kind, or a man in battle (a Brahmin is, however, allowed to kill his enemy in battle), and many trifling circumstances.

Of all the mixed classes, that of the *Pariahs* has attracted most attention, whether from their vast numbers—roughly computed by Dubois at a fifth of the population of Hindostan—or from the detestation in which they are held, and the cruel treatment they are subjected to by the other classes, especially in the south of India. A more abject state of slavery cannot be imagined; and the consequent degradation of its victims gives rise to their indulging in many disgusting and immoral practices, which, by a common mistake, have been sometimes assigned as reasons for their ill-treatment. The mere sight of a Pariah is considered a defilement by the upper classes; and if a Brahmin has the calamity to touch one involuntarily, he is only freed from the evil consequences by numberless purifications and endless ceremonies. Many of these miserable beings sell themselves and families, and have to drag out their lives amid the severest toil and unrequited menial services. Of late, however, Pariahs have been admitted into the European and native armies, where they often prove good soldiers, and even rise to distinction. There are several castes still lower than that of the Pariah scattered over different parts of India. Many of these have no fixed habitations, and are forbid to frequent towns or highways; others roam the country upon predatory excursions, acting as spies, robbers, or watchmen, as the case may be. The salt-bearers, serpent-charmers, &c. belong to these lowest castes, and from these are chosen the only persons who will consent to act as executioners.

Another division of the lower castes is into *left-hand* and *right-hand castes:* the former pretending to superiority, as occupying the left hand, or place of honour, of the goddess Kali; the latter aspiring to the exclusive use of certain emblems. The left-hand caste contains the five castes of artisans, and other mean tribes of Sudras; as also the most infamous caste—that of the Cobblers. The right-hand caste contains some higher Sudras, but also embraces the Pariah. Contentions, and even outrages of a serious character, frequently attend

the struggles for pre-eminence. 'I have frequently witnessed,' says Mr Ward, 'instances of these popular insurrections excited by disputes between the two bands, and pushed to such an extreme fury, that the presence of a military force had no effect in allaying them.' Many observers have believed that traces of a similar institution can be detected as having existed among the inhabitants of various countries. The subdivision of labour, which forms part of it, may, it is true, denote the first stage of an approaching civilisation, which all nations emerging from barbarism arrive at; but this necessary preliminary must not be confounded with a system which forbids choice of occupation, defends its artificial classification of employments as a religious dogma, and, above all, insists that this shall be hereditary. Caste, however, even in its strict acceptation, probably prevailed among the ancient Egyptians. The priesthood, soldiers, husbandmen, and artificers, seem to have constituted the four principal castes or classes; and an inferior one, comprehending menials, fishermen, and herdsmen, was held in the greatest contempt—the tending cattle and swine being considered as the most infamous occupation of all. According to Regnier, vestiges of such division still exist. De Goguet also asserts that, in the Assyrian empire, the people were distributed into a number of tribes, and that the son was not allowed to quit the occupation of the father, and embrace another. Many passages from the classics have been quoted to show that some such division existed among the ancient Greeks; and Duperrin quotes a passage from the Zendaresta to prove that castes existed among the ancient Persians. Mill sees considerable analogy between the Druids of ancient Britain and the Brahmins of India. Professor Millor, too, observes that our Saxon ancestors were divided into four classes—artificers or tradesmen, husbandmen, the profession of arms, and the clergy. The analogy in all these cases is very weak; those very essential points of difference being overlooked which form the key for the explanation of why, apparently, the same stage of civilisation which proves to one people but the first step to progressive and unlimited improvement, proves to another a barrier beyond which it cannot pass.

But not only are the traces of the existence of caste among other nations very obscure, and often very fanciful, but among the Hindoos themselves the operation of the institution is of much less practical importance than, from the accounts we read, we should have been prepared for. A critical writer in the Edinburgh Review, many years ago, intimated his doubts upon this subject in the following passage:—'Indeed the natural operation of such an institution is so diametrically opposite to, and incompatible with, the strongest principles of our nature, that we are inclined to believe its existence in a perfect state is altogether ideal; and even if it had ever been comparatively carried into practice, the baneful effect would have been so immediate, that the total annihilation of public spirit and enterprise would have been the inevitable consequence.' Even prior to the Institutes of Menu, the distinction of caste had practically proved inoperative; for Sudras had reigned as kings, and instances of depression of the other classes were not rare. In the present day, such examples are still common: even Sudra dynasties have been formed; and a poor Brahmin has been glad to gain subsistence by cooking the food of a rich Sudra. In fact the Brahminical office seems alone secure from intrusion; but the Brahmin himself may descend to any occupation not absolutely infamous. Mr Ward observes, that 'although the Hindoos give one another credit, as a matter of convenience, for being in possession of caste, and though there may be an outward, and, in the higher orders, an insolent show of reverence for its rules, if the matter were to be searched into, and the laws of caste were allowed to decide, scarcely a single family of Hindoos would be found in the whole of Bengal whose caste is not forfeited. This is well known, and generally acknowledged.' Mr Rickards, who has paid much attention to this subject, declares that, however such distinctions may have once prevailed, when the inhabitants of India were in small numbers, and possessed of slight energy, they no longer practically exist; and he insists upon the urgent necessity of disabusing the public mind upon this score, seeing that erroneous views in the government of this people have often prevailed, in consequence of the belief of this incapacity of improvement, owing to the prevalence of caste. He says: 'The great mass of Hindoos throughout India consists of mixed tribes of innumerable denominations, and tied down by no restraints which are not imputable to poverty, ignorance, and despotic power; and which the diffusion of knowledge and liberal institutions would speedily dispel. . . . I have myself seen carpenters of five or six different castes, and as many different bricklayers, employed upon the same building. The same diversity of castes may be observed among the craftsmen of the dockyards, and all other great works; and those who have resided for any considerable time in the principal commercial cities of India, must be sensible that every increasing demand for labour, in all its different branches and varieties, has been speedily and effectually supplied in spite of the institution of castes.' He also asserts that the same misery and indigence prevail among the Mussulman portion of India as the Hindoo, and refers it to other causes, to which we cannot now allude. He cites Bishop Heber's journal, as proving the great willingness of the Hindoos for engaging in, and their capability of executing, the various descriptions of employment.

It is nevertheless very certain that great evils are still experienced in India from the caste system, modified as it is. We believe they are not to be removed by any sudden or violent proceedings on the part of those who have the direction of the interests of our fellow-creatures in that extraordinary and interesting country. They will give way, as indeed they are doing, before the spread of intelligence, the increasing intercourse with Europeans, and the diffusion of the principles of that religion whose essential basis is the equality of mankind, and the importance of the individual in the eyes of his Maker, however mean he may seem in those of his fellow-creature. Until the opinion which still prevails of the moral distinction between castes succumbs before the progress of knowledge and religion, Europeans residing in India should be cautious how they treat the customs they find established with ridicule and contempt; for benefit will never result from hurting the feelings of those whose ignorance deprives them of the sources of enlightenment open to us; while a sense of wounded vanity, or mistaken piety, may produce a dogged adherence to the customs of their ancestors, and may shut their ears to future conviction.

'SKETCHES OF ENGLISH CHARACTER.'*

Mrs Gore is at present one of the most prolific writers of a fashionable class of works. With a lively fancy, considerable powers of observation, and a happy method of expression, her productions possess many attractions to the lounger in literature. We know of no drawing-room author who is more pointed or fascinating. Brilliancy of language and *persiflage*, however, are not qualities which can impart an enduring fame. Without breadth of sentiment, and a power of observation which looks beyond narrow conventional fields for materials, we can expect neither truth nor lasting appreciation. Like hundreds of others, Mrs Gore seems to be impressed with the odd idea that London is England; that the people who live in fine houses, and give fine dinners, and talk fine nonsense, in certain territories west of Temple Bar, are the people at large of this great empire—that the whole nation is squeezed into the bills of mortality. On some such notion as this the work before us is constructed. For 'Sketches of English Character'

* By Mrs Gore. 2 vols. Bentley, London. 1846.

—a sufficiently taking title—our accomplished authoress should substitute, 'Sketches of a few peculiarities observable in London.'

Looking no farther than the bricks which bound the Regent's Park and May Fair, Mrs Gore begins by lamenting the difficulty of finding any originality of character in the present day. 'In England, as elsewhere, every die is worn down, every angle rounded, every feature effaced, every salient point smoothed, pumiced, and polished into the most level monotony of surface; a surface from which neither dramatist nor novelist can extract either plot or character, without violating in the grossest manner the probabilities of civilised life.' That this may be true as respects certain departments of society, is perhaps indisputable; but to allege that 'in England' there is no longer originality or freshness, no variety, is only to confess that the inspection is confined to too narrow a field. From what do the great and varied movements of the provinces on matters of free and universal commerce, education, and philanthropy take their rise, but in that originality and vigour of sentiment of which Mrs Gore, in her drawing-room, seems to be uncognisant? England, in our opinion, while socially polished to a resemblance in external manner, never occupied a grander position as respects boldness and originality of conception. No age, however, can properly estimate its own character. We can only judge impartially in retrospect.

'Singing,' proceeds Mrs Gore, 'is now far from the only feat that is accomplished "by the million." People eat, drink, sleep, talk, move, think in millions. No one *dares* to be himself. From Dan to Beersheba, not an original left! All the books published seem to have been copied from the same type, with one of Wedgewood's manifold writers. All the speeches made might be stereotyped in January, by an able reporter, to last out till June. In society, men are packed one within the other like forks or spoons in a plate chest, each of the same exact pattern and amount of pennyweights.

'Would Shakspeare have invented Falstaff or Parolles in such an order of society? Would Scott have hit upon the Baron of Bradwardine or Lawyer Pleydell? Would even Fielding or Smollett have extracted the ripe humour of their inventions out of such a sea of batter? The few authors of fiction who pretend to individualise, are obliged to have recourse to the most unsophisticated class for elements of character; society of a higher grade being so used down into tameness, as to form one long, long Baker Street, or Guildford Street, of mean, graceless, and tedious uniformity—from number one to number one hundred, a hundred times ditto repeated.'

All this is more specious than just. Shakspeare's characters could not of course be discovered in the present day. They are things done and completed. But we shall not speak so confidently as to those of our own countryman—Scott. There are classes of society still to penetrate and illustrate. The misfortune is, that authors wont take the trouble to look for them. Scott did not wait at home, in an elegant study, to be visited by the originals of Douce David Deans, Edie Ochiltree, or Advocate Pleydell. Barring this unfortunate limitation of vision, Mrs Gore writes cleverly and well. She hits off London (west end) characters and modes of living to a tee. 'In London, whether the dinner occur at the house of a man of eight hundred a-year, or of eight thousand, you are cognisant, to a dish and a topic, what will be supplied for the delectation of your ears and palate. You eat the turbot and saddle of mutton by anticipation as you go along, and may chew the cud of the great letters of the ministerial and opposition papers, which anon you will have to swallow, diluted with milk and water by the dull, or vivified by a few drops of alcohol by the brilliant.

'In the evening entertainments, as at the dinners, "*toujours perdrix!*"—Jullien, Gunter, and Lord Flipflap—Lord Flipflap, Gunter, and Jullien! You see the same people waltzing, fiddling, and serving the refreshments, and hear the same phrases exchanged among them, at every fête given at the west end of the town between May and August. May and August? Rather say from A.D. 1835 to A.D. 1850!

'This tedious uniformity of conventional life, which has converted society into a paper of pins, with people stuck in rows, instead of minikins, is, we are told, the result of a high state of civilisation. The moment the English left off clipping their yew-trees, and laying down their gravel-walks at right angles, they transferred the system to society. "Ye fallen avenues!" (so pathetically sung by Cowper), you have *now* your parallels at every dinner party; and not a coterie in Grosvenor Square but presents the stiff, unmeaning rectangularity of Hampton Court Gardens.

'This eternal sameness of manners and opinions is, in fact, so notorious among ourselves, that no one ventures to say "It is a fine day," till he have ascertained whether such be the opinion of Lord Rigmarole or Mr Tompkins—whosoever may be the pope, or fugleman, or model-man of his set. And yet England still retains on the continent the distinction of being "*le pays des originaux;*" and one of the first ejaculations of a foreigner to an English person with whom he is on confidential terms is—"Admit that you are the oddest people in the world!"'

The cause of this generally uniform resemblance is alluded to as follows:—'The great origin of this peremptory uniformity is the influence of our habits of business. To facilitate despatch, everything the least out of the common way must be avoided, and all obstacles in the railroad of life removed. People have no time to lose in wonder. They like to find in the man with whom they have to deal a fac-simile of themselves, so that they can meet him, point to point, without demur or examination. As society is at present constituted, they know to an item with what and whom they have to deal in a stockbroker, banker, physician, or barrister. They could draw his portrait, or make a model of him, without ever having set eyes upon his face. Such people are made to pattern; and the type of each is as familiar to every mother's son of us, as though specifically sold at a turner's like a bat and ball.'

There is also no wonder now-a-days. Nobody is surprised at anything—always keeping in mind that 'nobody' means nobody in London. 'Time was that comets were esteemed prodigies, and produced a national panic the moment their tails whisked into sight; but now that their movements are as well understood and correctly chronicled as those of the sober-sided fixed stars, always winking in their proper places, people are delighted to be broken in upon by visitations which lend bloom to their roses and flavour to their vintage. Thanks to Van Amburgh and Carter, even lions and hyenas are tamed. Self-playing organs grind the oratorios of Handel into insignificance; and the Transfiguration of Raphael has lost its charm in the pale and worn-out lithographs which multiply and enfeeble its mysteries. The seven wonders of the world are in ruins; and the only wonder left is, that we cannot find out the secret of inventing an eighth.

'Our ancestors ran to look at an aloe in bloom, believing that it flowered but once in a hundred years. *We* know better; but the aloe has lost its charm. Our ancestors reverenced the oaks that extended their gigantic arms beside their dwelling, certifying its antiquity far better than the genealogical tree in their hall. *We* bring ancient trees in Pickford's vans to our lawns, and make them overshadow our upstart villas; but the oak has lost its charm. Our ancestors thought a shilling well spent for admittance to see the skeleton of a camelopard. *We* have giraffes giraffing unnoticed in the Regent's Park, and keep a serpentry for improving the domestic breed of rattlesnakes and boa-constrictors. But if Mungo Park or Waterton were to write their travels *now*, they would have lost their charm. The sting is taken out of everything: the flavour everywhere extracted!

'Even the most high court of parliament mumbles where it used to bite. Its thunderbolts have fizzed into squibs: its storms are rattled with a sheet of iron and a quart of peas. People care no more about appearing at the bar of the Reformed House than at the bar of the Eagle Tavern. The terrors of the place have vanished. The sultan, so terrible as the "turbaned Turk," is scarcely worth mentioning in a Fez!'

Yet Mrs Gore has hopes of the present lull passing away, and that by and by a really great man will arise. 'The first man who dares to think and speak for himself, and think and speak strongly, will become as Gulliver in Lilliput. The prodigious flock of sheep into which it has pleased our nation to subside, will follow at his piping. Let him ply his galvanic battery with address, and the corpse of our defunct literature will revive—making, perhaps, like other galvanised corpses, a few grimaces in the onset.'

Proceeding from general to particular definitions, the authoress offers a number of sketches illustrative of persons the most marked in this age of flatness. Among these we have sketches of 'Popular People,' 'the Gossip,' 'the Chaperon and Debutante,' 'the Standard Footman,' 'the Lady Patroness,' 'the Hotel-Keeper,' and so forth. One of the best in the lot is 'the Lady Patroness.' Provincial ladies may wish to know something of this great woman.

'In London life, patroness-ship is a matter of election. Among the two thousand noble or wealthy ladies whose names are supposed to lend grace to a subscription, or whose equipages, seen waiting at the private door of a Hanover Square bazaar, are known to increase its congregation of powdered footmen and wiggy body-coachmen, it is something to be solicited a sponsor for the nursling institution or starveling charity-school. In the country, on the contrary, it is a thing of inheritance.

'The great lady of any neighbourhood, whether a seventy-four duchess, or a gun-brig baronet's wife, becomes, as a matter of course, patroness of whatever attempts are to be made on the indulgence of the provincial public; nay, even the mayor's lady in a country town ascends the throne by right divine, failing higher branches in the succession.'

Plays cannot be got up for charity without this important personage; neither can charity sermons. 'You might as well have the plate at a cathedral door placed on a kettle-trivet, as in the hands of a pew-opener or churchwarden. A polite congregation loves to bestow its shillings and sixpences upon a charmer in a lilac satin pelisse, with French flowers in her bonnet. The lady patroness never looks more exquisite than when standing in the porch of an old country church receiving the copper contributions and courtesies of the poor old women in their red cloaks, who are willing to sacrifice their week's tobacco towards rebuilding the organ-loft; little surmising that the cost of the whole undertaking does not equal the value of the Brussels-lace veil of the lady who smiles so eloquent an appeal to their magnanimity. The harangue from the pulpit, the private badgering of the parish clerk, had failed to convince them—but who is to resist the elegance and affectation of the lady patroness?

'There are necessarily lady patronesses of all sorts and sizes, sects and opinions. The serious lady patroness—the great lady of Exeter Hall—the Madonna Laura of the Petrarchs in buzz wigs—the blue of Rivingtons and Hatchards—is the Hecuba of the tribe.

'A degree of respectability is attached to her rustling skirts, which ought to render them arrow-proof against the shafts of ridicule, even as the mail of a crusader or the scales of a crocodile. Her charity, unlike the charity that begins at home, is of the comprehensive species that wafts an obolus from Indus to the Pole, in order to furnish missionaries for the dusky tribes of heathenesse, and a maintenance for the still darker tribes lacking employment in the overstocked market of piety in Great Britain.

'Seldom, it is true, do we hear of these comfortable dames taking out twopence and giving them to the host in behalf of some needy wayfarer of the laity; more rarely still of their exercising their influence in society for the benefit of some victim of its injustice, its pride, or prejudice. When slanders and scandals darken the atmosphere, they are fain to let the wicked world have its way; unless when that way can be invaded by the thousand-parson force of prejudices stronger and more powerful still—crushed by the Thor-like hammer of a hierarchy, or brought down by the long rifle of a backwoodsman, taking his sly aim from behind the whited wall of evangelism. Devoid of all pretence to the heavenly meekness of genuine Christianity, the serious lady patroness *is* "puffed up"—"vaunteth herself"—and (under correction) "*doth* behave herself unseemly."'

But there are varieties of the character. 'Next comes the political lady patroness; the distributor of election ribbons, and other party gewgaws; the accredited monsterer of nothings inaudible in the gallery, lisped by the pap-boat members. Instead of the heaps of tracts damp from the press which moisten the carriage-cushions of the serious lady patroness, the morocco swabs of the political lady patroness are encumbered by the dog's-eared pages of some dry pamphlet—the last "striking effort" of the newest man of genius forced into bloom in the succession-house of her party.

'By vocation a fetcher and carrier of paper place-traps, she takes care to have the useful passages scored in pencil by the author, for the benefit of the minister's private secretary; and the objectionable ones scored in red ink by the minister's private secretary, for the instruction of the aspiring author. Not unfrequently the said author in his proper person usurps the place of his work, and is dawdled about in morning visits from house to house, in those environs of Grosvenor Square or Carlton Terrace which enshrine the penates of the great men of Downing Street.

'Next follows the literary lady patroness, a variety of the lion-feeder; saving that her lions are fed like courtiers—"promise crammed!" The literary lady patroness is a jackal to the annuals and other miscellanies of polite literature. She it is who provides a place in the alms-houses of the arts for Lord Thomas's verses or Lady Sarah's sketches; thereby eliciting the eternal gratitude of the editor, proprietor, printer, and binder of the golden library of the tabbies. She it is whose conversazione confers immortality on the unknown epic, and crowns with bays the prose of the poet and the poets of the prosy.

'Whereas the serious lady patroness is "an old woman clothed in gray," the literary one is usually a young one enrobed in cerulean blue. Mild as Helicon, she eschews the noisy gabble of her political rival, who appears to be over-talking a debate; and is measured in her dicta, and few and far between in her arbitrements, even as the solemn minute-guns of a quarterly review compared with the squibbing of a daily paper. Her gentle dulness recoils from the hurry and bustle of the great lady of the hustings; and, "like the fat weed that rots itself at ease on Lethe's wharf," she is usually to be found lolling dozily on the cushions of her boudoir, with the last volume of her latest protégé drooping from her hand!

'Never, however, does she fail to avail herself of your visit, to victimise you in favour of some subscription work or theatrical benefit—enabling you to see Shakspeare murdered in cold blood at the cost of two pounds two per hour. She is sure to have some Miss Seraphina Snobbs—"some virgin tragedy, some orphan muse"—to intrust to your sympathies. As a counterbalance to the enormous weight of advice wherewith she loads her unoffending protégés, she heaps up for their credit the half-crowns and half-sovereigns extorted from her friends, to be lumped into the subscription list as "Nine pounds eleven shillings and fourpence, collected by the Right Honourable the Countess of Indigo;"

beating out the gold of others into thin leaf, in order to gild the pill of her bitter counsel.'

We have, in these few passages, given perhaps a sufficient specimen of a work which, though not without faults—chiefly of omission—possesses a considerable fund of amusement; and will, we doubt not, add to the popularity of the fair authoress.

THE GREAT NORTHERN DRIFT.

Sir R. I. Murchison, in his late work on Russia, devotes a considerable space to an account of the blocks of stone, of various sizes, which are scattered in great profusion over a wide extent of that country, as well as over a large portion of the rest of Europe. These erratic blocks or boulders are composed of granite, quartz rock, and greenstones of various sizes, from three feet in diameter to nine and ten, some even of the enormous size of 40,000 cubic feet. They are scattered over an extent of country—from Hamburg on the west, to the White Sea on the east—covering an area of two thousand miles in length by four to five hundred miles in breadth. They have been termed erratic, as they have evidently been transported from a distance, and as they are common to the whole extent of country; while the detritus on which they frequently rest is composed of the local rocks and fragmentary matter of the separate districts, varying in character with the various rock formations of those districts. As these erratic blocks appear to be identical in character with the rock formations of the Scandinavian mountains lying to the north-west, and as the general direction of the drift has been traced as proceeding from north-west to south-east, the general term of 'Great Northern Drift' has not inaptly been applied to this deposit.

Though very generally scattered over the surface of the area just mentioned, yet there are some places where the boulders are wanting. In fact they appear to be distributed in zones or belts, in a longitudinal direction, with certain spaces between where none are to be seen. Generally, too, the higher portions of ground are thickly strewed with them, while none are to be found in the valleys. The largest masses of stone are found deposited in the northern part of the country, while towards the south the blocks diminish in size. Thus, in the neighbourhood of St Petersburg, masses of ten feet in diameter are of frequent occurrence, while around Moscow the blocks rarely exceed two or three feet in diameter; occasionally, however, some of the larger masses are found even a considerable way south.

As the greater part of the present surface of Russia, over which these boulders are so profusely scattered, is now level and uniform, with no high mountains or extensive declivities, the question arises—By what agencies were they transported to the positions which they now occupy? Sir R. I. Murchison is of opinion that the nature of the surface of the country precludes the idea that they were transported by glacier action at a period when the surface had already become dry land, and is more inclined to believe that the transportation took place while yet the present land was covered with the waters of the ocean. This transportation, he thinks, may have been due to the effects of two agencies. In the first place, to the action of 'waves of translation,' caused by the elevation of the Scandinavian mountains, by which an impulse would be given to the oceanic waves, sufficient, according to some late calculations, to produce the effect required; and, in the second place, to the transporting power of floating icebergs.

By this latter means, several of the phenomena attending the present position of the drifted masses can be readily explained. Thus the accumulation of blocks on the higher ground, while none are to be found in the valleys, may be accounted for by supposing that these prominences existed in the former seas, and that here the icebergs were arrested in their course, and detained till the summer sun melted them down, and liberated the imbedded masses of rock which they contained. The present aspect of the country exhibits these boulders as if they had been arrested while ascending declivities—as if they had been forced up-hill, and in a contrary direction to the present course of the flowing rivers; while there are evidently no high mountain-ridges near from whence they could have been derived.

The disposition of these blocks in zones or belts, with intervening spaces containing none, may be accounted for from the positions of the mountains towards the north and west, where they derived their origin. Thus a space of interruption between the mountain-chains in that direction, where no icebergs existed, and where of course there could be no fragments of rocks detached, would thus cause deficiencies in the currents, which bore from north to south in a regular and parallel direction.

There are strong grounds for believing, then, that during the period of the transport of this Great Northern Drift, the whole of the northern part of Russia was under water; that the Scandinavian mountains were alone elevated above the ocean; and that from this source were derived the masses of primary rocks which are now found so profusely scattered over the surface of the now elevated continent. At this period, too, the great Uralian chain appears to have existed as dry land, and to have formed a barrier to the extension of the erratic drift farther to the eastward. In the wide Siberian valleys to the eastward of this chain, and in the lake countries to the southward, there then lived innumerable herds of the mammoth and Siberian elephant, whose bones now strew those districts in immense profusion, and where even whole carcasses of those animals—with the flesh and hairy covering of the skins entire, and in singular preservation, amid the ever-during icebergs of that region—are not unfrequently met with. These animals appear to have been of a particular species, with long hair, fitting them for the vicissitudes of a northern climate, and with teeth so formed as to be adapted for masticating the twigs and succulent branches of trees as well as leaves. It is conjectured that, during the hot summers of the more southern part of the continent, these gigantic herds migrated to the borders of the cooler lakes to the northward, and that here many of them dying in successive seasons, left their skeletons; and not a few, perhaps, being suddenly enveloped in the cold of a changing climate, thus had their whole bodies effectually embalmed, and transmitted entire to a wondering posterity.

Another singular deposit in central Russia is a rich black earth called 'Tchornozen,' which occupies an area of the surface equal in size to a European empire.* It is deposited both in the valleys and higher grounds, and varies in depth from fifteen to twenty feet. Its particles are exceedingly minute, and in summer the least agitation raises a fine black dust in volumes from the surface of the turf. It forms one of the richest of soils, and produces several crops in succession without the application of any manure. According to several analyses, one hundred parts consist—of silex, 69·8; alumina, 13·5; lime, 1·6; oxide of iron, 0·7; organic matter, 6·4; humic acid, 1·7. It also contains a large proportion of azotised matter. Near the Caspian Sea it contains nitre; and in several places a considerable incrustation of salt. The original source of this immense deposit of earth has not been accurately determined. It probably owes its origin to a jurassic shale, which may have been thus finely disintegrated by the action of water. No traces of marine productions are found in it, and whether it has been formed by the action of the sea or of fresh-water lakes, is uncertain. Could it be transported to less favoured surfaces in other countries, there is perhaps in this vast deposit as much matter as would cover the whole of Britain with a soil as rich and fertile as the

* A slighter reference to this earth was made in a general article on Sir R. I. Murchison's book in a recent number.

most enthusiastic farmer could desire, while at the same time a sufficient depth would still be left for all useful purposes in the native region of this singular deposit.

THE LATE MR TEGG.

THE late Mr Tegg, whose decease we announced a few days ago, enjoyed for a long period an extensive reputation as a bookseller and publisher. His early career was one of struggling and difficulty, and his life presents another of the many instances, already recorded, of how much perseverance and earnestness of purpose can accomplish. At his death he left a large fortune. Mr Thomas Tegg was born in 1776 at Wimbledon, in Surrey. His father dying, he was left to the care of some friends, who sent him to Galashiels, in Selkirkshire, where, for the extremely moderate sum of ten pounds per annum, he was boarded, lodged, clothed, and educated by a Mr Graham, with whom he remained four years. At the end of that time he set out on a cold November morning to walk to Dalkeith, with nothing in his pockets but a letter of introduction to a party in that town, and a sixpence. There he obtained a situation. Removing to Edinburgh a short time after, he first saw Robert Burns, Hugh Blair, and Henry Mackenzie in the shop of Creech, which those worthies were in the habit of frequenting. From Edinburgh Mr Tegg found his way, after a time, successively to Berwick, Alnwick, Newcastle-on-Tyne, and Durham. After many privations and trials, he obtained employment in the last city. In after-years he visited Durham under more gratifying circumstances, having been honoured with an invitation by Dr Van Mildert, the bishop of that see. From Durham Mr Tegg removed to Sheffield, and worked in Mr Gale's printing-office, where he met with Thomas Paine, whose *Age of Reason* was first printed at Gale's press. His ambition, like that of almost every aspirant, was, however, turned towards the metropolis. Eventually he set out for London, where he arrived broken in spirit and low in purse. As he did not immediately obtain employment, his sufferings were great; but perseverance overcame them; and he entered the service of the then well-known publishers, the Messrs Arch and Co. of Cornhill, with whom he remained nine years. His care and prudence during that time placed him in a position to think of commencing business on his own account, and with that view he took a shop in Aldersgate Street, whence he afterwards removed to 111 Cheapside. In the former, Mr Tegg laid the foundation of his fortune; he commenced a system of evening book auctions, which he continued for many years, and which were afterwards profitably carried on by others in imitation of him. By means of these, and by entering largely into the publishing trade, either in issuing reprints or copyrights at a low price, he was, there can be little doubt, one of the most active pioneers of cheap literature, the blessings of which are now so extensively enjoyed. Mr Tegg was a man who combined powers of endurance under misfortune with determination of purpose in a remarkable degree. To use his own recent words—'Truly I can say that, passing through life, whether rich or poor, my spirits never forsook me so as to prevent me from rallying again. I have seen and associated with all ranks and stations in society. I have lodged with beggars; and had the honour of presentation to royalty. I have been so reduced as to plead for assistance, and, by the goodness of Providence, I have been able to render it to others.'—*Daily News.*

[We happen to have been a little acquainted with the late Mr Tegg, and can verify the above commendation of his character. Unlike many men who have risen from humble circumstances, he did not dislike alluding to the difficulties which he had encountered, but rather felt some degree of pride in telling how he had surmounted them. With a better education, the mind of Mr Tegg might have presented an aspect corresponding with his fortune. Even with the disadvantages under which he laboured from this cause, there was a largeness in his designs which argued no common man. Tegg's views were quite cosmopolitan. He did not think of publishing books for a mere London sale, but for the world. Calling himself a *book-merchant*, not a bookseller, his mind was constantly occupied with plans of universal publication. He despatched great cargoes of his wares to Australia, India, America, and other distant countries, receiving whatever articles could be conveniently sent in return. The last time we saw him in Cheapside, he had just received advice of a ship-load of wool being sent to him from New South Wales in liquidation of a debt for books. Never did we meet with a publisher so thoroughly imbued with the principles, and so eager to enter into the practice, of commerce. On inquiring to what he chiefly owed his success in life, he replied that it was to three things—punctuality as to time, self-reliance, and integrity in word and deed. In addition, however, said he, to these points, 'I have derived much advantage and comfort in life from being deaf, as well as blind, to all calumnies and attacks. I have never cared for what any one malignantly, or perhaps foolishly, said of me; neither have I been ready to resent real or imaginary affronts.' We believe that such is the acknowledgment of pretty nearly all men who have been successful in their career. There is no getting through the world with a temper which fires up at trifles. What the *Daily News* states regarding his concern in cheap literature is only an under-statement of the truth. We have understood that Mr Tegg was the earliest literary employer of the late Dr Birbeck; and that, by means of that gentleman and others, he was the first to attempt presenting scientific information in a cheap form.]

PEACE—PEACE!

THE *Bristol Young Men's Society* have sent the following address to the young men of New York. Involving some expressions which we should have been inclined to soften, it is an eloquent and arresting document, forming one of those signs of the times which public men would do well to study:—

'Brethren—We who now address you are associated in friendly union for the purpose of moral and mental culture. We are lovers of peace, believing that the principles of our religion forbid all war; and, following the blest example of other communities in our land, we send you peaceful thoughts, in order to prevent the monstrous sin and folly of the "trial by battle" between England and America. Human life, with all its untold mysteries and worth, we count a sacred thing, and utterly inviolable by the act of man; we therefore think that standing armies, warlike preparations, and death punishments, are foul blots upon the vaunted civilisation of this age, and melancholy proofs that Christianity is darkened, and that conscience slumbers, even in the most religious and the noblest nations of the earth. Is it not time, American brothers, that Christians should begin in earnest to make moral war against the great national sins and lies of the times? The brotherhood of man is part of the theory of every Christian church—and only of the theory. Commerce and science are the chief practical peacemakers; and our dwarfish Christianity almost leaves this heavenly work to them, and agitates the religious world with little surplice questions and metaphysical subtleties of doctrine—bitter and barren as the disputes between the Nominalists and Realists in the dark centuries.

'For nearly two thousand years there have been in the world divine principles which, if earnestly believed by those who have known them, would long ere now have made mankind one loving family, despite the accidents of colour, language, caste, and all the other different externals under which the essence of humanity dwells. We believe in this equal brotherhood of all men, not only as a theoretical truth, but as a future fact in the world's history—a coming reality, and perhaps not very distant. Believing this in our hearts, we repudiate national honour (as hitherto understood) as national infamy. We know of only one kind of honour wherewith nations or individuals ought to be invested, and that can be deserved only by those who practise justice, mercy, truth, and love. Military glory we abhor as unspeakable shame. We feel no patriotism but that which teaches us to regard the world as one country, and every human being our neighbour, to be dealt with after the Samaritan example.

'We have said nothing of the extensive and growing commercial intercourse between Americans and Englishmen, nor of the near relationship you and we bear to each other; our common language—almost immediate common

parentage. We do not forget these things; we deeply feel that they would invest the warfare between your nation and ours with special evils and horrors peculiarly its own; but we take our stand for peace on higher, deeper, wider principles than we can evolve from these circumstances of accident. We said that commerce and science are the chief peacemakers; but we have small faith that wars will permanently cease throughout the world till the principles of peace shall be part of the Christian's religion, and the Christian's religion shall be the religion of man.

'We earnestly commend these views to your deepest thought; and if you find them true, work with us in firm faith and cheerful hope till they take root in the Christian mind, and bless the world, or we are called from moral conflict here to everlasting rest.'

CAUSE OF DOUBLE FLOWERS.

The cause of double flowers has lately been explained in the *Revue Horticole*, on a rather curious and interesting principle. It is impossible for any inquiring mind not to attempt an explanation of the fact, that many plants which, in a state of nature, never present more than a single row of petals, begin to assume several rows under continued cultivation. The effects of a richer soil, and other genial circumstances, or the mere accident of double petals in one plant transmitted with improvement through its progeny, are the common explanations; and these are generally received as satisfactory, without reflecting that what we call accident is itself a result of some cause, and that change of condition must attack some physiological principle before it can have any effect in modifying the character of a plant. Nothing is now so common as double flowers; and 'to explain the phenomenon,' says the *Revue*, 'we must make practice agree with theory. Every gardener who sows seed wishes to obtain plants with double flowers, so as to have blossoms which produce the greatest effect. Every double plant is a monstrous vegetable. To produce this anomaly, we must attack the principle of its creation; that is to say, the seed. This being granted, let us examine in what way these seeds ought to be treated. If, after having gathered the seeds of Ten Weeks' Stock, for example, we sow them immediately, the greater number of the seedlings will produce single flowers; whilst, on the contrary, if we preserve these same seeds for three or four years, and sow them, we shall find double flowers upon nearly all the plants. To explain this phenomenon, we say that, in keeping a seed for several years, we fatigue and weaken it so, that the energy which would otherwise have been expended in producing stamens, produces petals. Then, when we place it in a suitable soil, we change its natural state, and from a wild plant make it a cultivated one. What proves our position is, that plants in their wild state, shedding their seeds naturally, and sowing them as soon as they fall to the ground, yet in a long succession of time scarcely ever produce plants with double flowers. We think, then, after what we have said, that whenever a gardener wishes to obtain double flowers, he ought not to sow the seeds till after having kept them for as long a time as possible. These principles are equally applicable to melons, and all plants of that family. We admit, like many other observers, that melon plants obtained from seeds the preceding year ought to produce, and do produce, really very vigorous shoots, with much foliage; but very few fruitful flowers appear on such plants; whilst, on the other hand, when we sow old seeds, we obtain an abundance of very large fruit. In fact, in all varieties of the melon, the seeds should always be kept from three to eight years before being sown, if we would obtain fine fruit, and plenty of it.'

BROTHERLY LOVE.

When do we begin to love people? When they begin to let us look into their hearts, and their hearts are found to be worth looking into.—*Cromwell's Literary Florets.*

PROSE AND POETRY.

I wish our clever young poets would remember my homely definitions of prose and poetry: that is, prose = words in their best order; poetry = the *best* words in the best order. —*Coleridge.*

'WORK FROM THE SOUL.'

COLOSSIANS iii. 23.

Work bravely and heartily now,
In the light beams of glorious day,
While the current of life in your veins
Runs joyous. Oh work while ye may!
For soon the dark night
Will her clouds spread around;
Who would happy be found,
Must work in the light.

Work heartily—not as a slave,
But lay all your strength on the oar,
And buffet the surf, till at length
You arrive at the opposite shore.
The heart that loves toil
Is buoyant and free,
As the waves of the sea
When in tempest they boil.

The Father of all glances down
On his sons as they strive in the race;
Upon all, first and last, he bestows
His looks of unspeakable grace.
Go on then in faith.
All that run well must win;
To faint were a sin,
Or to leave the good path.

The souls of the dead look to see
Their brothers who labour in fight.
Well know they the battle of life;
Even now they rejoice in the sight.
And the flash from their eyes
Fills the soldier with fire:
He never can tire
When such powers bid him rise.

Behold the bright crown of the brave,
How it glitters above in the sky!
He fears not cold death or the grave,
Who sets his affections on high.
Should idleness lurk
In the depths of your breast,
Look up to the blest,
See your crown—and then work.

TRETA.

MYSTERIOUS DEATHS.

It sometimes happens in the country that nearly a whole family is struck by malignant fever, and successively carried off. This happened lately at a farm-house in the south of Scotland. Not only did the farmer, his wife, and a female servant sink under the disease, but a son and daughter, and several other servants, narrowly escaped with their lives, and only by removing from the house. It was observed in this case that removal produced instantaneous improvement of health, but return to the devoted dwelling at once renewed the ailment. About the same time a similar tragedy happened near Stirling. A farmer, his wife, two sons, and a female servant, being the whole family, took ill of malignant fever, and died. The explanation which has been afforded to us in the first case perhaps supplies a key to all such mysteries. It has there been found that, immediately behind the house was a kind of mill-pond, into which every kind of refuse was thrown, or allowed to discharge itself, and that this collection of putrid matter had not been once cleaned out for a long series of years, no one dreaming of any harm from it. The momentous consequences from a cause so trifling, and the consideration that they might have been warded off by only a little knowledge, furnish ample matter for reflection. We are yet but in the infancy of an understanding of the subject of aërial poisons.

THE ROYAL EXCHANGE.

The Royal Exchange, in general, has been more fortunate in finding historians than that portion of it which we recently described as 'Lloyd's Coffee-House;' still, the current descriptions are for the most part imperfect and incorrect, and utterly without the sanction of official authority.

Like everything in the city, the existence of the Royal Exchange is owing to individual enterprise. This is the spirit and essence of commercial prosperity. The merchant is generally the architect of his own fortune; his pursuits necessarily bring him into contact with his fellow-men; and thus, while the principle of association obtains with him, and expresses itself in the guild and the corporation, in his own person he maintains a special individuality. To him who would indulge personalities, and portray characteristics, a visit to the city would afford many examples—some strange and odd enough, but all striking, and strongly-marked. In other pursuits of life there is more or less of a professional costume, which sinks the man in the official; but the merchant pleases himself, or acts upon early associations, in his dress and conduct. His success mostly depends, indeed, upon the personal. The great Rothschild is said to have had his '*secret*,' which even his lady sought in vain to penetrate, and which was the basis of his success. Sir Thomas Gresham, the founder of the Royal Exchange, is an illustrious example of the truth of these remarks. Edward VI. consulted him frequently on the best manner of proceeding to rid himself of debt; and Sir Thomas devised 'a *secret* scheme' for this purpose, the evolution of which required two years' trial. It perfectly succeeded. His plan was, to take up in Antwerp two or three hundred pounds sterling in his own name by exchange, out of money to be privately furnished by his majesty—a process of liquidation so gradual as not likely to be perceived, or to occasion any fall in the rate of exchange. As the king's debts did not exceed L.108,000, with interest, the time claimed was amply sufficient for the purpose. The result was, 'to raise the exchange from sixteen shillings Flemish for the pound sterling to twenty-two shillings; at which rate,' says his biographer, 'Gresham discharged all the king's debts; and by this means money was rendered plentiful, and trade prosperous, while the credit of the crown became established on a firmer basis abroad than it had ever been before.'

It was during his residence at Antwerp that Gresham conceived the idea of a Royal Exchange for London—the former city having already provided itself with such an accommodation in 'the Burse,' a building of noble dimensions. It was one part of Gresham's character that he was a thorough Englishman, and had the interest and honour of his country always at heart. He showed this by his advice to Queen Elizabeth when in need of a loan: 'Not to use any strangers, but her own subjects, that it might be seen what a prince of power she was.' He was indeed anxious, in all cases, that the merchants of London should benefit by the discounts and interest accruing on such transactions; and took care that the counsel he had given should not fail for want of his own exertions. Having conceived an idea, he had faith in it, and thus accomplished it.

Intelligent, successful, liberal, munificent—such are the attributes which necessarily belong to the merchant-prince—such qualities rendered Sir Thomas Gresham illustrious. Of these, therefore, he must have been an eminent example—a marvel, among useful and honourable men, of honour and utility. If not less ambitious than his compeers, he was, in fact, more generous. This habit of mind was sometimes even ostentatiously exhibited. When Queen Elizabeth, in 1576, visited him at his residence in Osterley Park, he not only entertained her with extraordinary festivity, but on her objecting that the courtyard was too large, and would look more handsome if divided in the middle, he sent forthwith for workmen from London, who laboured in the night silently; and by the time her majesty rose in the morning, a wall was erected, producing the appearance she had desired.

A mind so constituted was not likely to permit London to want what Antwerp enjoyed longer than necessity obliged. He yielded to delay with reluctance. Our readers are already aware that, previously to the erection of the Royal Exchange, the merchants of London had been accustomed to assemble in Lombard Street, which took its name from the rich and extortionate Lombard merchants who, anterior to the year 1274, came from the four Italian republics of Genoa, Lucca, Florence, and Venice, and settling in England, wrung from the necessities of Edward I. those exclusive privileges which enabled them to oppress the English trader and insult the English king. Edward III., to put a stop to their career, seized on their estates; but they survived the misfortune to lend money to Henry VI., and to receive, as security for the sum advanced, a mortgage on the English custom duties. They continued in Lombard Street till the reign of Queen Elizabeth, when it was reserved for Sir Thomas Gresham to confound their projects, and oblige them to quit the country. They are still remembered by their armorial bearings—the three golden balls, which pawnbrokers use as the ensign of their shops. The want of a Burse is said to have been felt also by the father and uncles of Gresham; and the desire to form one to have 'run in the family blood.' At length, in 1563, Sir Thomas announced his intention to erect one at his own expense. On the 4th January 1564 the offer was accepted by the Court of Aldermen, who forthwith engaged themselves

to supply a spot of ground for the purpose, and appointed a committee of aldermen and common councilmen to select a site. The Company of Merchant Adventurers were called on to contribute 400 marks towards the expense; and the several city companies advanced different sums by way of loan; care being taken to secure the benefit of the erection to the city in perpetuity. In fact, there is in the corporation books a special entry of a carouse held at the house of Mr John Ryvers, alderman, in which Sir Thomas, in the presence of witnesses, undertook, in case he should die childless, to bequeath the whole of the profits, in equal moieties, to the city and the Mercers' Company.

Certain houses formerly standing in Cornhill, and the alleys and lanes branching from it, having been removed, at the cost to the city of L.3737, 0s. 6d., Sir Thomas Gresham laid the first stone on the 7th June 1565, accompanied by a few aldermen, who, we are told by Stowe, 'every one of them laid a piece of gold, which the workmen took up.' By November in the following year, the building was completely covered in, and in a condition to receive the merchants. It was, however, not at first patronised as might have been expected; nor was it until two years after its completion that it received royal countenance. The queen then came into the city, and honoured the founder with her company at dinner. It was upon this occasion that it received the name of the 'Royal Exchange.' The architect employed by Gresham was a Fleming named Henryke, who seems to have designed it after the Burse of Venice, from which that of Antwerp was copied. Prints of it, as it then stood, still exist, dated 1569, with an inscription in French, Dutch, and Latin, in honour of the founder, whose crest—the grasshopper—surmounted the tower, and ornamented the corners of the building.

The royal visit was highly beneficial. Sir Thomas Gresham had remitted the rent for the year to the tenants of the shops that formed part of the building—a plan attended with so much success, that he was soon afterwards enabled to raise their rents considerably; for, owing to the show they made on the occasion of the queen's visit, the nobility commenced a custom of sending thither for the most costly articles, and thus the shopkeepers rapidly became rich. But for all this, in the first instance, the one man was wanting not only to commence the undertaking, but to induce his fellowmen, by rewards and promises, to promote by reasonable means their own interests. Thus it is that all great movements are really made; not by the large bodies who follow, but by the few individuals who lead. The mass of men, it would seem, are without providence, and need some Prometheus to volunteer for them, that they may reap the profit of enterprise without incurring the risk.

The history of the Royal Exchange, from this period to its destruction by the fire of London in 1666, is that of the country. The troubles of the great Rebellion, the character of the Commonwealth, and the nature of the Restoration, had each its type in connexion with this building. A statue of Charles I., which had been placed there, was removed on the 30th May 1648, and substituted with an inscription—*Exit tyrannorum ultimus*; which was in turn removed, and replaced with a new statue, after the return of Charles II. Here also, on May 28, 1661, the acts for establishing the Commonwealth were burned by the hands of the common hangman. The state of the Royal Exchange during the plague is told by Pepys and Lord Clarendon:—'By day, the streets presented a most frightful aspect of desolation and misery; and at night, the dead-carts, moving with slow pace by torchlight, and with the appalling cry, "Bring out your dead!" thrilled horror through every heart that was not, by suffering, hardened to calamity. The stoppage of public business was so complete, that grass grew within the area of the Royal Exchange!'

The statesmen of the famous period in which Gresham lived, and with whom he had intimate intercourse, were as eminent for their learning as for their political genius. The merchant was equally anxious to exhibit his love of letters as to advance the interests of commerce, and this the author of the Exchange showed by founding the college which is called after his name. He also provided that, after his death, the city should, out of their moiety of the property in the Royal Exchange, pay annual salaries of L.50 each to professors of divinity, astronomy, geometry, and music, who should deliver lectures at the founder's late residence. After the conflagration of the Royal Exchange, 'Gresham College' was, in the first instance, resorted to for commercial purposes; arrangements were there made for the accommodation of the merchants, until a new Burse could be erected.

The example having been once set, and the convenience of an Exchange having become apparent, the erection of the new Exchange needed not the special stimulus of an individual will, but was an object of desire to the general mind. A commercial city destitute of an Exchange was now thought, to adopt the language of Mr Malcolm in his *Londinium Redivivum*, 'as improper a residence for merchants as a parish without a church for that of religious people.' The first stone of the new building was laid on the 6th of May 1667. Sir Christopher Wren was the architect: the expense was shared between the Corporation and the Mercers' Company, and amounted to L.80,000. The royal consent was not obtained till afterwards, when Charles II. laid the base of the column on the west side of the north entrance on the 22d of October, on which occasion his majesty was feasted. The Duke of York and Prince Rupert laid the bases of other columns a few days subsequently, and were likewise civically regaled. The structure was completed on the 28th September 1669, and opened by the lord mayor, Sir William Turner, the king having been prevented from attending.

Owing to the fire of 1838, the Royal Exchange thus erected by Sir Christopher Wren is now only matter of history. The architecture, as most of us recollect, was beautiful—the four orders of the quadrangle being indeed magnificent, and richly decorated with the basements, arches of the walks, the cornices over them, the niches, statues, pillars, circular windows, entablature, pediments, and balustrade, all in correct proportion and arrangement. Its principal front was towards Cornhill; and on each side there were Corinthian demi-columns, supporting a compass pediment; within each of which were niches, containing statues of Charles I. and II. in Roman habits, by Bushnell. Within the quadrangle there were twenty-four niches in the intercolumns, with statues of English kings and queens—most of the kings before Charles II. being sculptured by Cibber. The centre of the area had for some time a statue of Charles II. by Grinlin Gibbons, which was subsequently displaced for one by Spileer, habited in the Roman style. In an obscure position under the piazza the statue of Gresham, too, had its niche; and nigh to it, that of one whose modesty would have been better content had his merit received no such acknowledgment—Sir John Bernard; to whom, in his lifetime, the memorial was erected as a mark of civic respect, but who could never bring himself to visit the walks afterwards.

We regret that the history of Gresham College is less satisfactory than that of the Royal Exchange. The civil wars and the fire of London having pressed hard on their funds, the city of London endeavoured to get rid of the cost of the lectures, which, though at first considered of great importance, gradually declined in interest. In 1768, an act of parliament was even obtained 'to make over the ground whereon Gresham College stood to the crown;' and a proposition was made by the city and the Mercers' Company to pull the college itself down, and build an excise office on the site; which was done. From the moment, indeed, that the founder conceived the generous idea of converting his own house into a college, there was a jealousy expressed. Sir Thomas

Gresham, it would appear from an address to him from the vice-chancellor and senate of the university of Cambridge, had made some promise of contributing towards building a new, or repairing an existing college. This design he seems to have subsequently enlarged. The enlarged design was approved of, but the site was objected to. The university authorities endeavoured to dissuade him from selecting London, lest it might prove prejudicial to Oxford and Cambridge. He himself had been educated at Cambridge, and this was urged as a reason why Cambridge should have a preference. We have seen that he persisted in his good intention of giving the city of London a college. We regret that the boon has been so ill received; and that, up to the present moment, it has been altogether abused, the lectureships being little better than sinecures.

We now come to the consideration of the subject in relation to the times in which we live. On the night of the 10th January 1838, the structure of Sir Christopher Wren was burned to the ground. On the particulars of this calamity we need not dwell; they are doubtless fresh in our readers' recollection. The merchants of London for a time made the Guildhall their place of meeting, and afterwards the area of the Excise Office—the site of Gresham House and Gresham College; thus, as far as circumstances allowed, re-enacting the scene of former times. In preparing to re-erect the Royal Exchange, many interests had now to be considered—those of the underwriters at Lloyd's, the Royal Exchange Assurance Company, and the shopkeepers who had occupied the ground-floor. An act of parliament was also necessary, which received the royal assent on the 10th August 1838, and empowered the Gresham Committee to purchase and remove all the buildings to the eastward, extending nearly to Finch Lane, and to raise L.150,000 upon the credit of the London Bridge Fund. Premiums were at length advertised for the three best designs. More than fifty competitors appeared. Three architects—Sir Robert Smirke, Mr Gwilt, and Mr Hardwick—were chosen to report on their productions; and these gentlemen considered that the designs numbered 36, 43, and 37, best answered the conditions prescribed; but declined to recommend them for adoption. To the artists—Mr William Grellicz, Mr Sydney Smith, and Messrs Chateauneuf and Mee—the premiums were nevertheless paid. Ultimately, a limited competition between five architects—Sir Robert Smirke, Mr Gwilt, Mr Tite, Mr Barry, and Mr Cockerell—was proposed, but only Mr Tite and Mr Cockerell entered the arena. The preference was at length given to Mr Tite; and on Monday the 17th January 1842, the foundation stone was laid by Prince Albert, with much state and ceremony, full descriptions of which appeared in the newspapers of the day. Within three years from that date the new Royal Exchange was completed—a very brief space of time for such a work, especially considering that it consists entirely of stone.

The structure does credit to the artist, and to a great extent realises the character of grandeur, simplicity, and usefulness which he desired to give to it. The west front is of course the principal feature. Here a portico is placed, superior in dimensions to any in England, and almost equal to any in the world. It consists of eight Corinthian columns, with two intercolumniations in actual projection, and the centre part also deeply recessed. The width is ninety feet, and the height from the ground to the apex of the pediment is seventy-four feet six inches. From the level of the street it is ascended by thirteen granite steps. Here, on the right and left of the entrance, are the offices of the Royal Exchange Assurance for Assuring Shipping, Fire, and Lives. Next in dignity is the east front. In the projection of his plan, the artist had to conquer a difficulty relative to the situation of the tower, arising from the shape of the ground, because, to quote his own words, 'Any tower placed to agree with the lines of the south front must disagree with the lines of the east and west fronts, which are in different planes; and such an object, when seen from a distance, or from the area of the Exchange, would produce an effect that would be discordant and unarchitectural; because it would bring into distinct notice a fact which it should be the business of the architect to conceal. For a long time,' he continues, 'I contended with this difficulty, because I was anxious to place the tower or towers in the south front; but it was impossible to get over the irregularity. It would indeed have been easy to have concealed this defect in the drawings, or have kept it out of notice; but the result, when built, would only have ended, in my judgment, in disappointment and failure. For these reasons, and with these views, I have composed my design as it is now exhibited. I have placed a portico at the west end, and the tower at the east.'* The first storey of the tower, at the east front, is square, with ornamental pilasters; at the angles there is a niche, with a statue of Sir Thomas Gresham by Behnes. The figure is erect, fourteen feet six inches in height, and chiselled out of two blocks of Portland stone.† Above is an attic for the clock faces. The next storey is circular, decorated with Corinthian columns, and crowned with a leaved dome, surmounted by the vane—the famous grasshopper of the old Exchange, which, fortunately, the fire had not much damaged.

Under the tower, at the eastern entrance, there is a small area for giving light and air to the inner mass of that part of the building. At the north end of this area, as we have already said, is the entrance to Lloyd's. At the centre of the building, on the north and south, there are also entrances to the Merchants' Area. Both these fronts exhibit unbroken lines of entablature, with a repetition of rusticated arches for the shops, offices, and entrances. The architect made a point of this peculiar style. He had in his mind 'the universally-acknowledged good effect of the Bourse at Paris,' in which 'the lines are simple and unbroken, and the large arched windows surrounding the walls behind the columns have all the character of shops or offices.' 'We are deficient,' he adds, 'in England, of specimens of architecture of that unbroken kind. Were I to adduce instances, I should quote the National Gallery as affording an illustration of the bad effect of broken and detached masses, and the Reform Club of the excellent effect of continuous and unbroken ones.' The three middle spaces on the south side are deeply recessed, surmounted with richly-decorated windows; above the cornice are a balustrade and attic; on the north side the centre projects; and at the end spaces the pilasters are omitted; for two of the windows, niches are substituted—one of them to contain a statue of Sir Hugh Myddleton, by Joseph; and the other a statue of Sir Richard Whittington, by Carew.

Such is the architectural character of the building: among its accidental adjuncts are a peal, in the tower, of fifteen bells for three chimes, cast by Mears, and a clock constructed by Mr Dent, under the direction of Professor Airey, the astronomer-royal, the first stroke of each hour being true to a second of time.

Provision has been made in the new building against fire. The ground-floor, as in the old, is still appropriated mainly to shops and offices; but each is complete in itself, separated by party-walls and brick arches, as well from the apartments above as the tenements beside them; so that any accidental fire must be local.

---

* Mr Tite's Letter to the Grand Gresham Committee, dated 27th April 1840.

† As whatever relates to Sir Thomas Gresham is interesting, we may record here the circumstance that a portrait, painted on panel, life size, of the royal merchant lately came, by bequest, into possession of the City Lecture Hall. The work is held to be a fine specimen of the arts of its period, and represents Sir Thomas at the age of twenty-six. He is attired in a plain black doublet, hose and gown, with a flat cap upon his head, and a small lace collar—all indicative of the unpretending British trader. In one corner of the picture are the letters 'A. G.,' tied together by a knot, beneath which are the words, 'Love, serve, and obei;' and under that 'T. G.,' also tied by a knot; and upon the frame, which is of black wood, and of the same age as the picture, is the motto, 'Dominus Mihi Adjutor, T. G.,' repeated on each side.

We must not, however, conclude this paper without reference to the sculpture with which the new Royal Exchange has been adorned. That by Mr Richard Westmacott, in the tympanum of the pediment at the west front, deserves earliest and highest mention, both from its position and its merit. Allegorical in subject, it nevertheless avoids the objections to which such compositions are generally liable. It consists of seventeen figures, carved in compact limestone, and, with two exceptions, modelled as entire and detached figures. The centre figure, which is ten feet high, represents Commerce—with her mural crown, her cornucopia, beehive, and other accessories. Her left hand holds the charter of the Exchange, her right rests on part of a ship—two dolphins and a shell forming her pedestal. The groups on either side consist, on the right, of three British merchants in their civic robes—as lord mayor, alderman, and common councilman; two Asiatics, a Hindoo, and a Mohammedan, in appropriate costume; a Greek bearing a jar; an Armenian scholar, and a Turkish merchant: and, on the left, of two British merchants examining some woven fabric shown to them by a Persian; a Chinese; a sailor of the Levant; a negro; a British sailor cording a bale of cotton; and a supercargo, or factory agent. The opposite angles are filled with anchors, jars, packages, and other nautical and commercial emblems.

The internal area of the Royal Exchange is uncovered, presenting an open court, somewhat resembling the cortili of the Italian palaces; consisting, on the ground-floor, of Doric columns and rusticated arches, over which is a series of Ionic columns, with arches and windows under a pierced parapet. The upper storey also has arches: these are decorated with the arms of various nations, according to the order determined at the congress of Vienna—the arms of England occupying the centre of the eastern side. There is also a sheltered walk for merchants, with the ceiling and sides panelled, painted, and emblazoned with the arms of countries and monarchs; namely, Edward the Confessor, Edward III., Elizabeth, and Charles II. The south-east angle also boasts a statue of Queen Elizabeth, and the south-west a statue of Charles II.

It only remains now to speak of the statues of Queen Victoria inside the building, and of the Duke of Wellington without. The latter is a bronze equestrian figure, by Chantrey, and was composed of the metal of the guns taken from the enemy, contributed by the government, and valued at L.1500. The cost of the statue itself was L.9000. It was completed on the anniversary of Waterloo, the 18th June 1844, when the inauguration took place, at which the king of Saxony attended. On the 28th October following, the new Royal Exchange itself was opened by the Queen in person with great state and ceremony. It was not until the 27th of October in the next year that her Majesty's own statue was placed on its pedestal in the centre of the area. Of this work a friend thus writes:—'There is here no anachronism—no pedantry. It is the statue of Queen Victoria—her image as she lived—in the robes she wore, rendered poetic by the inspiration, and picturesque by the genius, of art; free from theatrical exaggeration; equally balanced, chaste, and pure, as well as noble. Such a portrait statue, produced for a Leo X., or a De Medici, or presented to the population of a mediæval city in Italy, would have given a triumph to the artist. Mr Lough deserved an ovation at the hands of the citizens. What will be thought in time to come of the age in which we live, when royal patronage, state commissioners, and the public money not only conspire to call out a *quasi* power of art from the depths of oblivion, but also conspire, meanwhile, to neglect a genius capable of giving honour and illustration to any age or nation?'

These remarks are somewhat enthusiastically expressed; but the inconsistency to which they point certainly provokes animadversion. The mercantile element clearly too much predominates, and the artistic is reduced to a mere accessory. The same remarks apply to literature, and the mode in which the Gresham lectureships are now managed. No amount of censure can be too heavy in condemnation of the present glaring neglect and misconduct. The site of the institution has been changed. The new Gresham College stands at the corner of Basinghall Street and Cateaton Street. It is of the enriched Roman style of architecture. There are a library, a lecture-theatre, and a professor's room; but the end for which these means have been prepared has yet to be secured. What would Sir Thomas Gresham himself have said to this? For the honour of the founder, and from respect to his memory, we call upon the authorities of the college to lose no time in making all needful and possible reforms. We know intimately well that there are many men of literary tastes among the merchants of London. Let them be consulted, and immediate measures taken for the prosperity of an institution not less glorious in its object than the Exchange itself. Literature and commerce are twin powers, and should never be divorced in operation: united, the progress of society proceeds safely, blending use with beauty; separated, wealth may be accumulated; but without intelligence to direct its aims, it is a mockery and a snare—a burden and a yoke. And such will be, must be, the reflections of every one capable of at all entering into the spirit of Sir Thomas Gresham.

A DAY IN THE HIGHLANDS OF CORSICA.

It is now nearly twelve years since an accident to the small trading vessel in which I had embarked for a passage from Palermo to Marseilles obliged us to bear up for Bastia, it being the only port then under our lee where we could get the damage repaired. This gave me an unlooked-for opportunity of visiting the birth-place of Napoleon. At that time steam-navigation in the Mediterranean was in its infancy (it is only on the great lines that it is good for anything yet), and the island of Corsica, lying out of the direct track of merchant ships, and having, besides, a bad general character for unhealthiness, was seldom or never visited. My own stay was necessarily so short, that I could see little, but the adventures of only one day have made much impression on my memory.

It was already dusk, when, from pitching and rolling upon the open sea, we suddenly slid into the quiet of the harbour; and there was barely light enough to show us the outline of 'Le Lion,' the singular rock, so called from its likeness to a couchant lion, which, with head and paws outstretched, lies, as it were, on guard before the entrance. The peacefulness of the evening was perfect. The broad dark sheet of the harbour lay at rest beneath the weakening light, growing blacker and blacker every minute, as the shadows of the overhanging heights steadily lengthened over its surface, till by degrees, as the actual outlines of the buildings on shore faded from the view, the glimmer of their lights in turn began to flicker along the margin of the basin. The land-breeze came sighing down upon us over the water, laden with the perfume of the orange-trees, and brought with it the hum of many voices from the promenade, on which the whole population had turned out to enjoy the refreshing coolness. When we landed, the night was, as I have said, too dark to distinguish anything; but in the morning we walked about the town, which is quite Italian in character; and the people, too, are Italian, or nearly so, with a perceptible dash, however, of the French in many of their customs, particularly among the ladies, who appear in the evening quite in Parisian costume. I naturally looked on every side for some monument of Napoleon; but, to my surprise, there was nothing of the kind. The emperor, it is well known, showed no favour to his native country—probably because his Corsican origin could not be expected to raise him in the

eyes of the French—and he is naturally no favourite in his birthplace. Our own hero, Nelson, on the other hand, was often mentioned, though this might have been in compliment to me as an Englishman. The remains of the works from which he cannonaded the place are still visible on a steep eminence overlooking the harbour.

The streets generally are high and narrow, as in most towns of Italian construction, and reasonably neat; and that is all. But the situation is very fine. Immediately behind the town the ground slopes gently upwards, forming the foreground to a bold line of precipitous heights, clothed along their flanks with vineyards and olive-grounds, and crested by groves of the ever-green oak; while above and beyond these, in the distance, the chain of the Monte Stello stands out clear and distinct against the splendid southern sky, with one bold serrated peak towering in the midst, like the central keep of the district. From a common effect of so transparent an atmosphere in these latitudes, the mountains, though in reality many miles off, seem to look into the town, forming, as it were, a Vandyked and irregular border to the blue mirror of the Mediterranean, which on every other side, save where it is dotted with a group of far distant islets, blends imperceptibly with the horizon.

It was impossible to see the magnificent mountain tops so provokingly near, without a strong desire to look at them more closely. For this, however, a guide was indispensable; and I found it no easy matter to get one. The Corsicans, like most southern people, seem to care very little for their scenery; and although almost at their doors, the mountains are as little known and traversed by them as the Grampians were by our grandfathers a hundred years ago. Like them, they have to plead in excuse that mountain travelling is neither very easy nor very safe. The only persons who are acquainted with these wilds are the banditti, who find them a capital stronghold from which to carry on their trade, either alone, or in conjunction with that of shepherds, goatherds, or smugglers, as the case may be. The guide whom at last I succeeded in finding was a very robber-like person, with a worn, suspicious face, bronzed almost to blackness by the sun, a magnificent spread of the chest and shoulders, and, to judge from the cordage of sinews about the calf of the leg, which the opening of his leathern gaiters showed in all their protuberance, no less gifted by nature with what is as necessary to a depredator as strength and hardihood—the power of running away. He made no secret himself of having been a smuggler; but whether he confined himself to levying contributions on the king's revenue, or varied it by raising them direct on the king's subjects, the gens-d'armes must have rejoiced at the cause, whatever it was, which led to his turning an honest man. Probably he might think open robbery too precarious—pleasant, but impolitic.

With this potent auxiliary—who turned out, as far as I was concerned, a very honest fellow—I started at sunrise, on a roasting July day, to visit the cavern 'Dei Quattro Banditti' (a congenial name), situated high up in the flanks of the aforesaid Monte Stello. I had always hitherto been disappointed in caverns; but this was situated in the heart of the scenery I wished to visit, and the story connected with it gave it interest. As the day's journey promised, at all events, to be very fatiguing, and part of the way at least was reported practicable for horses, a couple were hired, and a peasant engaged to bring them back. Though it was barely five o'clock A.M., by the time we had got out of the town it was oppressively warm; but we did not feel the sun at first, as our path led directly in among the vineyards; and for the next half hour we were trotting briskly forward under the overarching boughs, in a kind of half twilight, with an occasional bar of golden sunshine streaming on us from between the stems. Nothing can be conceived more delicious in such a climate than these bowers of coolness, with their long prospective avenues of leaves, and the perfect quiet, only broken by the hum of wasps and dragon-flies, or the twitter of a bird as it hangs pecking at the rich clusters of fruit overhead. From these we emerged suddenly into the full blaze of the sunshine, upon an arid table-land, bare of all vegetation save a few stunted juniper-bushes, and cut up by ravines and brooks, one of which, flowing direct from the Monte Stello, was to serve us as a guide. At the end of this plateau we had to dismount, and leave our horses with the peasant; the rest of our journey being a mere scramble, often on hands and knees, in many parts over ground of the most treacherous description, where the rains had washed away every trace of a path, leaving in its stead nothing but gravel and rolled stones, which slid from beneath our feet, and fell in showers into the muddy torrent below at a depth most unpleasant to contemplate. Two hours of this work took us at last into a kind of amphitheatre of black granite rocks, at the base of which we stood among a chaos of fragments, some of which, matted with moss, or in parts overgrown with bushes and brambles, seemed to have lain there ever since the creation; while others, from their fresh and splintered angles, had evidently rolled over from above at no remote date. Directly in front, the Fiumetta (so called) streamed in one clear pitch of two hundred feet at least, sending up a volume of spray, which the wind showered over us, and beyond. It was close to this fall that we were to look for the cavern. At this distance of time I have no clear recollection of the exact position in which it was placed with respect to the surrounding rocks, or of the path by which I attained it; but I recollect very vividly the uncomfortable sensations with which, on my foot slipping in one perilous stride, I found myself suspended between heaven and earth by the bough of a wild olive-tree growing in the face of the precipice. This I clutched just in time to save myself, and with infinite joy swung my body, safe and sound, past all danger of slipping, upon a ledge of rock not more than three feet in breadth, facing an oven-shaped hole, which was the portal of the cavern that had given me so much trouble to visit.

The cavern of the four banditti is so called from its having been the stronghold of four famous outlaws, who were enabled by it to escape destruction from the Genoese in a manner sufficiently remarkable. As we rested on the rock, before entering the cave, it was impossible not to admire the fitness of the place for the story connected with it. From here, we could look for miles over the valley of the Fiumetta, and the dim lines of the plain which we had traversed in the morning. Bastia itself lay out of sight under the shoulder of the hills; but the sails of the various vessels approaching or leaving its port were distinctly visible, like specks on the horizon. The entrance of the cavern was so narrow as to be invisible from below; but after creeping some yards through a kind of passage, like a fox earth, which reminded me painfully of the description in Guy Mannering of a similar place, it rose into a large open vault, as high as that of a cathedral, and running back a great way into the rock at the same height. A dusky light streamed from above through some crevice in the rock, and served to give us a vague idea of its extent, without showing any visible termination. Where it fell strongest, the fragments of an earthenware pot and some scattered bones were lying; and in one part the side was still blackened with the smoke of the fire which had been reared against it. At the sight of these relics, the guide, who had till then fully maintained the lazy indifference of a son of the south, became amazingly energetic, and alternately vented curses against the Genoese, and ejaculations for the souls of the departed. As we rode back in the evening, I got him to give me the whole story, which he did with great gusto, evidently taking in it a professional interest.

The year 1729 is celebrated in the history of Corsica for the commencement of that series of intestine struggles which, after calling forth the energies of many remarkable men, of whom Paoli was the chief,

ended in substituting the French for the Genoese as its masters. The feeling among the islanders was generally in favour of the rising; but it was not without alloy. The Genoese had held the island for centuries; many avowed connexions had been formed with the natives; and many hearts which had beaten with mutual, though unavowed affection, were now to be separated for ever. Among other connexions of the kind, a girl named Cornelia Cartucci was at this time betrothed to Marcangelo Santi, a Genoese of noble family. Before the marriage could take place, the insurrection broke out, and Santi, under pretence of obedience to orders from his superiors, refused to complete the contract.

An insult of this kind is one which a Corsican never forgets or forgives. The four brothers of Cornelia vowed vengeance, and kept their vow. As a preliminary step, characteristic of the country now as then, they took to the mountains as banditti, and from thence despatched a letter to Santi, requiring of him, categorically, to fulfil his promise within one month from the date thereof; and if he should fail in so doing, declaring their deliberate intention to put him to death. The letter met with no attention; and within one week from the fatal limit, Francesco, the eldest brother, fulfilled the threat by pistolling Santi with his own hand in the high street of Bastia.

By this time the first burst of the revolt had been put down for the moment, and the Genoese, as is always the case with a weak government when it has been heartily frightened, prepared to punish all engaged in it to the uttermost. The assassination of Santi, though arising out of private pique, was still an outrage on one of the dominant party, and had originated in national differences. The commandant at Bastia set a price of one thousand crowns on the heads of the guilty parties, and promised an equal sum, and a free pardon, no matter for what crime, to any bandit who should succeed in bringing them to justice. The brothers, upon this, consulted with their partisans among the villagers, who, looking on them as sufferers in the national cause, were to a man zealous in their behalf. The pursuit threatened to be so very keen, that it was impossible to hope to lie hidden in the villages. Some time before, an ibex hunter had lighted upon this cavern: it was known, as they thought, only to themselves. The approach was by one path, and that exceedingly difficult; and even if they should be discovered, no amount of force, nothing but starvation, could dislodge them. Hither, then, the brothers retreated, with arms, ammunition, and a stock of food and water for a week, which it was agreed one or other of their friends should replenish every four days.

For nearly three weeks it seemed as if the bandits had vanished into air. The government, upon this, raised the reward to two thousand crowns—an immense sum for the time and country; and at length it had its effect. Four bandits, called the robbers of Ficaja, volunteered upon the conditions proclaimed, and were accepted. They had not been long upon their quest, before they noticed the regular departure of one or other of the peasants with a much larger supply of food and water than could be wanted for one day's field-work. The next emissary was followed, and tracked to the hollow among the cliffs; but there the clue stopped. Along the wide face of the precipices no smoke or sign of life was to be seen, and the absolute silence was only broken by the croaking of the ravens, which had their nests among the crags. Convinced, however, that their object could not be far off, three of the men remained to watch, while the fourth was despatched to communicate the news of their discovery at Bastia.

At this news the Genoese were in ecstacies of joy proportional to their previous disappointment. A company of voltigeurs were immediately despatched; the church bells rang out in the villages; and, as the peasantry had no alternative but to obey, in less than three hours five hundred armed men were assembled. The whole force was immediately marched up the mountains, and so stationed as to cut off all access from without. Every approach to the stream was especially guarded; and as no water could be got among the granite rocks, it was confidently expected that thirst alone would force the bandits into a surrender.

The situation of the besieged was horrible. The magnitude and disposition of the force took away all hopes of escape. Five days had passed since they had received their usual supplies, and there was only a piece of bread remaining, and no water. Death, however, was equally certain whether they surrendered or not. Their position was impregnable; and they took a common oath to hold out to the last, and prepared to endure the silent progress of hunger and thirst with that tenacity of passive sufferance characteristic of a southern people. The small piece of bread—about eight ounces—which remained was divided into four equal parts, and served them for a meal the first day. A second, a third, and a fourth day were passed in quiet endurance. By the end of the fourth they had devoured their shoes, belts, and everything which could prolong life. But their hunger was nothing to the raging of their thirst. Not a drop of rain had fallen: the sky remained a cloudless blue; and, as the climax to their suffering, they could hear, almost underneath their feet, the rushing of the stream, without a possibility of reaching it. They had not been without hopes of deliverance by assistance from without; but though the peasantry carried their sympathy so far as to offer up prayers for them in the churches, their spirits were too much broken to offer actual resistance to the authorities.

On the fourth evening, Pasquale, the youngest, proposed to surrender, since nothing could be equal to what they actually suffered. But Francesco refused. 'I am very sure,' he said, 'that I shall die myself, as my hand has brought this on us; but you may still escape; and if not, better we die as we have lived together, than give a triumph to our enemies.'

It seemed as if his words were prophetical. The next morning a gray mist was on the sky, heavy clouds were sweeping along the lower range of the hills, and the lightning was very frequent, broad, and deeply-tinged with blue. At length, in the afternoon, the storm burst upon the encampment, which lay completely exposed to its fury. The Fiumetta, which, from the protracted drought, had scarcely run on the preceding day, came down in a wall of water, which soon boiled up over its narrow sides, and cut off the Corsicans on the hither side from the Genoese beyond. The tents were blown down; the rain had put out the watch-fires; and as the night came on without a star in the heavens, each group remained crouched together at its post, dreading to stir in the absolute darkness. To the brothers the storm and the darkness seemed a direct interposition of Providence in their favour, which nerved them to make a desperate effort to escape. The descent to the base of the precipice was one hundred and sixty feet in depth, and nearly perpendicular. By cutting into strips all that remained of their garments, and tying them together, a line was formed, which barely reached half-way down, and the chance was slight of finding the proper footing during the remaining half. The same darkness, however, which made it perilous to them, veiled them from their enemies; and if the rock had fallen, it would not have been heard amid the roaring of the torrent and the storm combined. They made the attempt, and Pasquale and Dominico reached the bottom in safety. Francesco was last, and had achieved two-thirds of the descent, when Salvator, the third, who was immediately beneath him, feeling his own footing give way, threw up his arms, and caught with the strength of despair at the stone on which Francesco was standing; it loosened beneath the double strain, and a sudden rush through the air told the brothers their fate.

'And did the others escape after all?' I asked, as

simultaneously with the end of his story we paced into Bastia.

'They escaped, excellenza, to Napoli, where Pasquale died. Dominico was my mother's uncle, excellenza—a famous bandit! Such an eye, such a shot! nomo bellissimo! who never robbed less than twenty crowns, or missed confession at Easter in his life!'

GOUGH, THE AMERICAN TEMPERANCE APOSTLE.

THE republication in this country of a little volume, of which seventeen thousand copies have been sold in America, makes us acquainted for the first time with a very remarkable young man, named John B. Gough, who has, within the last three years, sprung from the ranks of the working-classes in that country, and, we may add, from the degraded herd of the dissipated, and is now in the full blaze of popularity as an apostle of the Whitfield class, but in the immediate cause of total abstinence. The volume is entitled, 'The Hand of Providence Exemplified in the History of John B. Gough.'* It is chiefly an autobiography; and a most extraordinary revelation does it give of human error and misery. The author has evidently regarded it as a sacred duty to expose every circumstance in his career as a sot, in order to tell upon the unhappy beings who are still under the bondage from which he is emancipated. There is much eloquence in the volume; and, what is more surprising, there is much naturalness and affecting simplicity. We therefore recommend it even to those who merely read for amusement, or with the general desire of studying the features of our common nature.

Gough was the son of an English private soldier, and came to America, at twelve years of age, in the service of an emigrant family, who undertook the care of him. In consequence of dissatisfaction with his treatment in this family, he found himself, at fourteen, a friendless adventurer in the streets of New York, with half-a-crown in his pocket. He got employment as an errand-boy; and by and by his mother and sister came from England to join him. The mother, however, who was an excellent person, soon after died; the sister went to a trade in another city; and the poor youth was once more alone in the world. It is easy to see that, with an ardent temperament and some lively talents, Gough was exposed, in such circumstances, to great danger. It is certainly not surprising that, when he attained manhood, his original moral impressions were obliterated, and he was become a person of reckless life. Possessing a good voice for singing, and a power of telling comic stories, he was tempted into the society of thoughtless young men, who taught him to drink. Then ambition led him to forsake his trade as a bookbinder for the stage; but meeting only with disappointment, he returned to work. Still, he was restless and unsteady. At about twenty years of age we find him engaged in a fishing adventure in the bay of Chaleur; and soon after he married the sister of the owner of the vessel. Before this time King Alcohol had marked him as one of his most devoted subjects.

At Newburyport, where he set up house as a married man, he for a little while maintained an effort at reformation. 'I recommenced,' says he, 'attending a place of worship, and for a short time I attended the Rev. Mr Campbell's church, by whom, as well as by several of his members, I was treated with much Christian kindness. I was often invited to Mr Campbell's house, as well as to those of some of his hearers, and it seemed as if a favourable turning-point or crisis in my fortunes had arrived. Mr Campbell was good enough to manifest a very great interest in my welfare, and frequently expressed a hope that I should be enabled, although late in life, to obtain an education. And this I might have acquired, had not my evil genius prevented my making any efforts to obtain so desirable an end. My desire for strong liquors and company seemed to present an insuperable barrier against all improvement; and, after a few weeks, every aspiration after better things had ceased, every bud of promised comfort was crushed. Again I grieved the Spirit which had been striving with my spirit, and ere long became even more addicted to the use of the infernal draughts which had already wrought me so much wo than at any previous period of my existence.

'And now my circumstances began to be desperate indeed. In vain were all my efforts to obtain work; and at last I became so reduced, that at times I did not know, when one meal was ended, where on the face of the broad earth I should find another. Further mortification awaited me, and by slow degrees I became aware of it. The young men with whom I had associated in bar-rooms and parlours, and who wore a little better clothing than I could afford to put on, one after another began to drop my acquaintance. If I walked in the public streets, I too quickly perceived the cold look, the averted eye, the half-recognition; and, to a sensitive spirit such as I possessed, such treatment was almost past endurance. To add to the mortification caused by such treatment, it happened that those who had laughed the loudest at my songs and stories, and who had been social enough with me in the bar-room, were the very individuals who seemed most ashamed of my acquaintance. I felt that I was shunned by the respectable portion of the community also; and once on asking a lad to accompany me in a walk, he informed me that his father had cautioned him against associating with me. This was a cutting reproof, and I felt it more deeply than words can express. And could I wonder at it? No. Although I may have used bitter words against that parent, my conscience told me that he had done no more than his duty, in preventing his son being influenced by my dissipated habits. Oh how often have I lain down and bitterly remembered many who had hailed my arrival in their company as a joyous event! Then plaudits would ring in my ears, and peals of laughter ring again in my deserted chamber; then would succeed stillness, only broken by the beatings of my agonised heart, which felt that the gloss of respectability had worn off, and exposed my threadbare condition. To drown these reflections, I would drink, not from love of the taste of the liquor, but to become so stupified by its fumes as to steep my sorrows in a half-oblivion; and from this miserable stupor I would wake to a fuller consciousness of my situation, and again would I banish my reflections by liquor.'

A kind-hearted countryman not only succoured him in his extremity, but set him up in business. Drink, however, brought him to ruin in five months. The details which he gives of his habits surprises us; for it is uncommon for the young in our own country to keep liquor constantly beside them in order to maintain an enduring intoxication. 'To what shifts,' he says, 'was I reduced in order to conceal my habit of using intoxicating drinks! Frequently have I taken a pitcher, with a pint of new rum in it, purchased at some obscure groggery, and put about one-third as much water as there was spirit in it at the town-pump, in the market square, in order to induce persons to think that I drank water alone. This mixture I would take to my shop, and for days and days together it would be my only beverage. In consequence of this habit I would frequently fall asleep, or, if awake, be in so half-torpid a state, that work or exertion of any kind was quite out of the question; and after an indulgence in this practice for some time, I was compelled to remain at home from sheer inability to enter on active duty. I grew of course poorer and poorer, and my days dragged wearily on. At times I almost wished that my life and its miseries would close.'

His wife having left him temporarily one morning on a visit, Gough, finding his home somewhat lonely, commenced drinking at a gallon of West India rum which

* London: Darton and Clark. 1846.

he had in the house. 'Although the morning,' says he, 'was not far advanced, I sat down intending to do nothing until dinner-time. I could not sit alone without rum, and I drank glass after glass until I became so stupified, that I was compelled to lie down on the bed, where I soon fell asleep. When I awoke, it was late in the afternoon, and then, as I persuaded myself, too late to make a bad day's work good. I invited a neighbour, who, like myself, was a man of intemperate habits, to spend the evening with me. He came, and we sat down to our rum, and drank together freely until late that night, when he staggered home; and so intoxicated was I, that in moving to go to bed, I fell over the table, broke a lamp, and lay on the floor for some time unable to rise. At last I managed to get to bed; but oh! I did not sleep, for the drunkard never knows the blessings of undisturbed repose. I awoke in the night with a raging thirst. My mouth was parched, and my throat was burning; and I anxiously groped about the room, trying to find more rum, in which I sought to quench my dreadful thirst. No sooner was one draught taken than the horrible dry feeling returned; and so I went on, swallowing repeated glassfuls of the spirit, until at last I had drained the very last drop which the jar contained. My appetite grew by what it fed on; and having a little money by me, I with difficulty got up, made myself look as tidy as possible, and then went out to buy more rum, with which I returned to the house. The fact will perhaps seem incredible, but so it was, that I drank spirits continually without tasting a morsel of food for the next three days. This could not last long; a constitution of iron strength could not endure such treatment, and mine was partially broken down by previous dissipation.

'I began to experience a feeling hitherto unknown to me. After the three days' drinking to which I have just referred, I felt one night, as I lay on my bed, an awful sense of something dreadful coming upon me. It was as if I had been partially stunned, and now, in an interval of consciousness, was about to have the fearful blow which had prostrated me repeated. There was a craving for sleep, sleep—blessed sleep! But my eyelids were as if they could not close. Every object around me I beheld with startling distinctness, and my hearing became unnaturally acute. Then to the singing and roaring in my ears would suddenly succeed a silence so awful, that only the stillness of the grave might be compared with it. At other times strange voices would whisper unintelligible words, and the slightest noise would make me start like a guilty thing. But the horrible burning thirst was insupportable; and to quench it, and induce sleep, I clutched again and again the rum bottle, hugged my enemy, and poured the infernal fluid down my parched throat. But it was of no use—none. I could not sleep. Then I bethought me of tobacco; and, staggering from my bed to a shelf near, with great difficulty I managed to procure a pipe and some matches. I could not stand to light the latter, so I lay again on the bed, and scraped one against the wall. I began to smoke, and the narcotic leaf produced a stupefaction. I dozed a little; but feeling a warmth on my face, I awoke, and discovered my pillow to be on fire! I had dropped a lighted match on the bed. By a desperate effort I threw the pillow from the bed, and, too exhausted to feel annoyed by the burning feathers, I sank again into a state of somnolency. How long I lay I do not exactly know, but I was roused from my lethargy by the neighbours, who, alarmed by a smell of fire, came to my room to ascertain the cause. When they took me from my bed, the under part of the straw with which it was stuffed was smouldering, and in a quarter of an hour more must have burst into a flame. Had such been the case, how horrible would have been my fate; for it is more than probable that, in my half-senseless condition, I should have been suffocated or burned to death! The fright produced by this accident and very narrow escape in some degree sobered me; but what I felt more than anything else was the exposure. Now, all would be known, and I feared my name would become more than ever a byword and a reproach.'

The consequence of this bout was an attack of delirium tremens, the sensations of which he describes with fearful fidelity. Returning to work as a journeyman, he endeavoured to indulge in his vice without exposing himself to the world; but with all his anxiety on this point, his habits became notorious, and he sank into disrepute and poverty at the same time. In the midst of domestic miseries thus produced, his wife and surviving child perished. He continued to drink while they lay dead in the room beside him. 'There, in the room where all who loved me were lying in the unconscious slumber of death, was I gazing, with a maudlin melancholy imprinted on my features, on the dead forms of those who were flesh of my flesh and bone of my bone. During the miserable hours of darkness, I would steal from my lonely bed to the place where my dead wife and child lay, and in agony of soul pass my shaking hand over their cold faces, and then return to my bed, after a draught of rum, which I had obtained and hidden under the pillow of my wretched couch.'

Amidst all this horrible conduct, he contrived to obtain at least occasional employment. We could suppose that there was something about him that awakened a kind interest in those around him, notwithstanding every delinquency. Indeed there can be no doubt, both from his earlier and his latter life, that there were noble natural elements in this man; only for the meantime enchained in debasement by passions to whose undivided control he had been exposed in the course of a morally-unprotected youth. The *good* in him was every now and then endeavouring to break through. 'My custom,' he says, 'was to repair to the lowest grog-shops, and there I might usually be found, night after night, telling facetious stories, singing comic songs, or turning books upside down, and reading them whilst they were moving round, to the great delight and wonder of a set of loafers, who supplied me with drink in return. Who would have recognised in the gibing mountebank, the circle of a laughing, drunken crowd, the son of religious parents—one who *had* been devoted and affectionate not so very long before—one, too, who had felt and appreciated the pleasures which religion alone can bestow? At times my former condition would flash across my mind, when, in the midst of riot and revelry, conviction would fasten its quivering arrow in my heart, making it bleed again, although I was forced to hide the wound. And through the mists of memory my mother's face would often appear, just as it was when I stood by her knee, and listened to lessons of wisdom and goodness from her loving lips. I would see her mild reproving face, and seem to hear her warning voice; and, surrounded by my riotous companions at certain seasons, reason would struggle for the throne whence she had been driven; and I would, whilst enjoying the loud plaudits of sots,

> "See a hand they could not see,
> Which beckoned me away."'

Gough was a wretched, broken-down, half-ragged outcast, whom all had learned to shun, when one evening, towards the close of 1842, some one tapped his shoulder as he walked along the street. He could scarcely believe his senses, when, turning round, he found a person looking kindly upon him—the first time such a thing had happened for many months. This was an emissary of temperance, who had marked his miserable state. Gough was, by the winning kindness of this person, induced to come to a temperance meeting and sign the pledge. He felt at first a sense of relief, and a pleasure arising from the honest desire to keep a good resolution; but for a week his sufferings, from an enfeebled system, deprived of its usual though unnatural pabulum, were dreadful. Fortunately, by the persevering support of the good men amongst whom he had fallen, he was preserved from relapse. Behold now a strange metamorphosis—the miserable drunken book-

binder finds that he can speak in public, with effect, upon his late errors! It is discovered that he has gifts calculated to be of great service in one of the highest of causes. His religious feelings return; his admirable inherent morale is fully evoked; a wonderful oratorical power breaks out in him. Multitudes come full of eagerness, and hang for hours upon the voice of one whom, a few weeks ago, all were anxious to shun. In short, Gough begins to circulate from one temperance meeting to another, until he finds it necessary entirely to abandon his original trade. During the two ensuing years he laboured with astonishing activity and success. 'From the 15th of May 1843,' says he, 'to the 1st of January 1845, I travelled more than twelve thousand miles by land and water; delivered six hundred and five public addresses in churches, halls, public buildings, and in the open air—one hundred and ten of which were in the city of Boston alone; and obtained thirty-one thousand seven hundred and sixty signatures to the total abstinence pledge.' It can only be mentioned to his honour, that he made *one lapse* a few months after taking the pledge, for he was the first to announce it himself; and his contrition appears to have been deep, sincere, and effectual.

Gough is now running the career of a popular orator in his own country. A gentleman who went from curiosity to hear him at Philadelphia, and was induced by his eloquence to take the pledge, describes the excitement previous to the orator's appearance as excessive. The scene is a church; and while a little group are pushing through the crowd towards the pulpit, intense curiosity is expressed to know which is *he*. At length a young man is distinguished. 'That's he!' whispers everybody to everybody else.

'What! that pale thin young man, with a brown overcoat buttoned closely up to his chin, and looking so attenuated, that a tolerably persevering gust of wind would have had no difficulty in puffing him to any required point of the compass—*that* him who has swayed multitudes by his oratory—made strong men weep like little children, and women sob as if their hearts would burst! Yes; look at his large expressive eyes—mark every feature—and you see the stamp of no common man there. The young apostle of temperance *is* before us.

'After a brief address from Mr Marsh, and a prayer from the pastor of the church, a hymn was sung, and then Mr Gough came forward. I had now a better opportunity of observing him. His face was pale, and there needed no very scrutinising eye to detect on the brow of youth furrows which time and trouble had prematurely ploughed there. His cheeks were very pale, somewhat sunken, and their muscles were very distinctly marked. The mouth, by far the most expressive feature of the face, was of a benevolent formation (if I may so describe it), and at times a smile of inexpressible sweetness lurked about it. A quantity of dark hair nearly covered his forehead, yet leaving one temple bare, indicating a brain of more than ordinary capacity. In dress he was extremely simple—plain black. Taken altogether, I have seldom, at a first glance, felt so lively an interest in any celebrated man (and I have seen many) as I did in Mr Gough.

'It would be easy enough to give the *matter* of Mr Gough's address; but to convey anything except a very slender idea of his *manner* would be a sheer impossibility, and I shall not attempt so hopeless a task. To be fully appreciated, he must be heard. He commenced by disclaiming any intention of entering on an argument, and said that he should mainly depend on facts, the results of his own experience, or those of others which had fallen under his notice. He then described his own career as an intemperate man, and drew pictures of such terrific power, and yet so truthful, that his hearers shuddered as they listened to the dreadful details. To me intemperance had never before appeared in all its horrible, startling hideousness. The impressions made by Mr Gough on his audience seemed to be profound; and many of his pathetic anecdotes drew tears "from eyes unused to weep."

'It being Sabbath evening, Mr Gough did not indulge in any reminiscences of a ludicrous nature, but confined himself to a delineation of the awful features of intemperance as exhibited every hour in our daily paths. His illustrations were marvellously felicitous, and most aptly introduced. Never did he utter anything approaching to vulgarity, and often his eloquence was of a high order. He told us that he had never known the advantages of education (a fact which none would have suspected); that he had left England at twelve years of age; had suffered from poverty and want in their direst forms; and had felt, when death had robbed him of all who made life dear, that he was utterly *alone*. It was the most awfully interesting autobiography I ever listened to.

'During that week and the week following Mr Gough lectured to congregated thousands in Philadelphia; and so fascinated was I by his eloquence, that, with the exception of two meetings, I heard all his addresses. The excitement was tremendous. To obtain any chance of hearing him, seats were obliged to be procured more than an hour and a half before the time of commencement. Gallery and pulpit stairs, and aisles, were thronged with people of every class. I shall never forget the scene at the Chinese Museum, where, on two occasions, three thousand people paid twenty-five cents for the privilege of hearing him; and even then, hundreds were unable to obtain admission. Mr Gough enchained that vast audience for two hours by one of the most effective addresses I ever heard. At one moment he convulsed them with merriment, and then, as if by the touch of an enchanter's wand, he subdued them to tears. It was a wonderful display of his power over the feelings and passions; and yet, withal, there was so much of humility, that one knew not which most to admire—the man or his matter.'

ANALYSIS OF A PIECE OF MUSIC.

Novelists and essayists have so frequently found the manner of the performance of what is called a 'piece of music' a fruitful theme for ridicule—beholding something so excessively ludicrous in the diffidence, whether affected or real, of the performer, and in the paidolatry of some music-loving father or mother, as the musical young lady of the family is seated at the piano—that the subject is worn to a thread by the constant rough handling it has experienced. Let ours be the attempt to elicit a little amusement from the 'piece' itself, out of which it may be drawn perhaps quite as abundantly, and in a far more kindly manner, than if we were to satirise the timidity, or denounce the defects, of that large class of ill-used people, the piece performers.

'Pieces'—apt name! there is no such thing as an 'entire' in the technology of music—may be classed under the heads reprehensible and laudable. The first we consider, as including all variations or concerted pieces upon airs of intrinsic value—more's the pity; and the second, all other original music, such as overtures, oratorios, &c. Well, then, we may premise that all these reprehensibles have what is called an introduction, as if to beg your favour for what is to come. The introduction commences with a couple of bang-bangs—saving your ears—designed to call attention; and as they not unfrequently fail of this effect, not uncommonly they are made to extend along the first line, by which time, in common politeness, you must have been silenced. This extraordinary beginning is made to wear a particularly awful aspect, if the air is grave or sad, and is suffered to bear a more lively character if the same is more or less vivacious. These primary concussions are succeeded by a combination of the most

astounding successions of notes or 'runs' the ear can conceive—of which the main object would appear to be to make sure that all the notes of the piano are ready for circulation. One or two such eruptions follow; and then comes a pause; during which the exhausted player and the unfortunate playee are supposed to take wind, anticipatory of the charge which is to come. The introduction then proceeds to cut to pieces the air, which is to undergo future anatomisation throughout the twelve pages of the piece; and taking one little bit and putting it here, and another and fixing it there, it is judiciously contrived to convey an impression of the most profound obscurity, and uncertainty as to what is to be the nature, or what could possibly be the name, of that air. Thus we analyse the first five double lines of the first page. The sixth and last most commonly combines an extraordinary evolution—of which, to an unmusical reader, the best idea may be gathered by comparing it to a very active run up stairs, followed by an equally rapid run down, with two more concussions, and three or four notes, which leave an impression of vacancy on the ear, analogous to that which would be produced if, in the recitation of some lines of poetry, three or four words of the concluding line should be repeated, and the last few words necessary to complete rhythm and rhyme left out. As might perhaps be anticipated, the object of this curious conclusion to the introduction is to work up the curiosity of the hearer to that pitch of excitement which will make him most delighted to welcome the air as something which, after so much of the execrable, shall at least be tolerable.

Then comes the air, so soon to be cruelly victimised. It is the conception of some master-mind; and its sweet notes, its simple chords, and its unaffected grace, one would suppose would touch the hard heart even of a variation composer. No; never did sacrificial knife plunge more ruthlessly into the heart of an innocent garland-crowned victim, than does the scalpel of the composer dive into this unfortunate air. Why are not bad airs selected to be mangled and deformed—a proceeding which would be perfectly justifiable and laudable? The answer is, it is a grain of gold alone which can overspread a wire of baser metal, and give it its lustre for hundreds of yards in length.

Then we come to 'the variations;' so called, perhaps, because they differ as much as possible from the original air. The peculiarity about this, which forms the principal portion of the piece, consists in the ruthless manner in which all the most beautiful parts of the air are sliced up. Thus, if the piece consists of a series of variations upon the air of 'Auld Lang Syne,' the first line, 'Should auld acquaintance be forgot,' will be dealt with in this manner:—'Should,' and its corresponding note in the air, will be placed first at the beginning, then at the middle, and then at the end of a series of such runs up and down stairs as were before mentioned; and after having been shuttlecocked through many a bar, will be cast aside, to give place to a novel succession of the same, or similar manœuvres, to be played off upon 'auld—acquaintance—be—forgot.' The chances are twenty to one if the last variation will not prove a relentless massacre of the air entire, ingeniously effected by some alteration of its measure, or by a reset of the same notes with the interposition of a few very original ones into a set of quadrilles, or a waltz, or a polka, or some such other intricate composition. But the piece of music has its end, long and tedious as it may be. The finale comes at length to close the scene, and commences by the performance of the air in its unmutilated proportions, which must be looked upon merely as a placebo for that which is to come. Then succeed fresh scamperings up and down—we mean along the key-board; and then our by-this-time very 'auld acquaintance' is caught up again, and becomes symbolised by a profusion of shakes, unquestionably illustrative of the perfect heartiness of the welcome of such an 'auld-lang-syne' friend; while 'never brought to mind' is given with dreadful pathos, as if, at the bare supposition of such an event, the entire body of the instrument were falling into convulsions. And thus to the melancholy end of the song; until its metamorphosis is so complete, that, to the best of our conceptions, were its venerable old composer to awake from the tomb, and behold his unhappy offspring in its new clothes, there could scarcely be a possibility of his recognising it.

To us by far the most amusing, as well as the most welcome portion of the piece, is that which forms its absolute conclusion. The great fun here seems to be just this—that you are to be continually deceived as to the downright end of all. Long before ever the last page is executed, one would be ready to swear that the whole was done; yet just as your mind is made up about it, there comes a surprising explosion, which undoes all that had been done before. Then you are carried over the same ground again. Surely here we are at last at the terminus? Vain is the hope! You turn away in despair, out of which nothing can arouse you but the thunder of the actual end, which seems as if the piano had been stuffed with gunpowder, and set light to—an explosion which is followed by the final prolonged growl of the weary bass, as it goes back to a state of rest.

To be serious. What, in the abstract, can be more absurd than such a composition as that we have been analysing—successful only in this, that it mutilates the beauty, and destroys the stern, solemn, and venerable aspect of our national airs? What can be greater than the folly of cutting to pieces such airs as 'Auld Robin Gray,' 'Scots wha hae wi' Wallace bled,' 'Rule Britannia,' 'God save the Queen,' 'Of a noble race was Shenkyn'—preserving only enough of their peculiarities to render them occasionally recognisable, if so much, and converting alike the most grave, mournful, and touching airs with those whose associations and antiquity entitle them to our regard and respect, into such harlequinades as quadrilles and waltzes? It is as if a modern upholsterer were to trick out with the gay decorations of our time the sober and majestic grandeur of some gray old castle.

Such is a species of caricature upon the original airs, which, if it applied equally to the words, no person would fail to condemn. And who will tell me that the words, either for their beauty or appropriateness, are entitled to more respect than the music which conveys and animates them?

There is a rage in the present time for hunting up the very noblest of our airs, and transmuting them, with the addition of a large quantity of alloy, into quadrilles and polkas; and thousands of giddy feet dance to parodies of that music which, at another epoch, fired the courage of our ancestors, and kindled their valour on the field of battle.

I could almost wish that the pibroch and harp had been silent, rather than that their outpourings, at the most solemn and pathetic seasons, should be mimicked in the polka, the waltz, or the quadrille.

Of the national music of our sister country we say nothing, but that the airs seem principally made to be danced to, and that fightings and buryings appear to be regarded in such a funny light, as to divest us of much of our pity when we behold them cleverly dissected under the experienced hands of some of our modern composers.

As all reformations are works of time, we lay down our pen without any over-sanguine expectation of, in our day, witnessing such a revolution entirely accomplished as that the class of compositions we have shortly criticised shall be no longer in existence. Posterity will look back upon them as amongst the follies and infirmities of our period, and perhaps some bi-

millenarian reader, in looking over a *few* of our back numbers, will appreciate our effort and say, and perhaps write to the editor and tell him, that here was another essay fifty years before its time.

GEOLOGICAL CONNECTION OF BRITAIN AND FRANCE.

It has long been a favourite subject of speculation whether the island of Great Britain was not formerly a part of continental Europe, the junction being at what is now the Straits of Dover; in other words, whether France and England were not conjoined by a narrow isthmus, just as Africa is united to Asia by the isthmus of Suez, or North and South America by the isthmus of Panama. This opinion, startling to those little acquainted with geological phenomena, was entertained by Volscus, Niger, Honoratus, the French poet Bartas, and by several of our own early writers, as John Twin, Dr Richard White, and Richard Verstegan. So late as 1753, a society at Amiens made it the subject of a prize essay, which was gained by the philosopher Desmarest, then beginning to attract attention by his talent and ingenuity. The latter founded his arguments chiefly on the identity of composition of the cliffs on the opposite sides of the strait—on a submarine ridge which extends from Folkestone to Boulogne, at a depth of only fourteen feet at low water—and on the identity of the noxious animals in England and France, which could not of themselves have crossed the existing channel, and which could never have been introduced by man. The demolition of the isthmus he attributed to the preponderating violence of the oceanic current from the north, and to a slight elevation of the German Ocean above the waters of the English Channel. Desmarest's views are generally entertained by modern geologists, and, among others, by Mr Lyell, who observes—'It will hardly be disputed that the ocean might have effected a breach through the land—which in all probability once united our country to the continent—in the same manner as it now gradually forces a passage through rocks of the same mineral composition, and often many hundred feet high, upon our own coast.' It is not to add any new argument in support of this theory that we now direct attention to the subject—for we believe most geologists are at one as to the former union of the two countries—but to draw attention to the views and arguments of Richard Verstegan, which were published two hundred and forty years ago, and from which, one would think, Desmarest has borrowed everything of value in his celebrated Prize Essay. Verstegan's opinions are given in the fourth chapter of his 'Restitution of Decayed Intelligence in Antiquities, concerning the most noble and renowned English Nation'—a rare and curious volume of considerable merit, dedicated to James I. of Great Britain. We shall here extract his principal arguments, merely modernising the orthography, so as to render them more readily intelligible to the ordinary reader.

Referring to the great resemblance between the cliffs of Dover on the one side of the Channel, and of Boulogne on the other, he justly observes that they are both of one kind of substance; 'that is, of chalk and flint, the sides of both towards the sea plainly appearing to be broken off from some more of the same stuff or matter that it hath some time by nature been fastened unto; the length of the said cliffs along the sea-shore being on the one side answerable in effect to the length of the very like on the other side, and the distance between both not exceeding twenty-four English miles, are all great arguments to prove a conjunction in time long past to have been between these two countries, whereby men did pass on dry land from the one unto the other, as it were over a bridge or isthmus of land, being altogether of chalk and flint, and containing in length about the number of miles before specified, and in breadth some six English miles or thereabouts; whereby our country was then no island, but a peninsula, being thus fixed unto the main continent of the world.

'Some may here object that other hilly parts of cliffs of the sea-shore are in many other places seen to be broken away, as steep and as straight down as these here spoken of; which I confess to be true, and thereunto do answer, that it is a plain sign that the violence of the sea has so worn and eaten out the sides of them beneath at the bottom, that the upper part, for want of under-propping, hath fallen down. And, moreover, where it also is found that inland rocks or hills are seen to have had some part of them broken away, as I have observed in passing the Alps and other mountains, this may well be thought to have proceeded, in old time, by occasion of earthquakes; but the breaches found in rocks are never seen to pass all along in any sort of evenness, but here and there without any kind of course or order. Besides, they are formed craggy by nature, or the wind and the rain having long since beaten away the earth from them, may thus have left them to appear the very true anatomies of themselves.

'It is further to be noted, that in our ancient language the cut off or broken mountains on the sea-sides are more rightly and properly called cliffs, than by the name of rocks or hills, that appellation being more fitting unto the inland mountains; but the name of cliff, coming from our verb to cleave, is unto these more aptly given, for that they seem unto our view as cleft or cloven from the part that some time belonged unto them; and albeit (as I said before) many cliffs are in many places of the sea-shore to be seen, as well as at Dover, yet are they not seen so to be answered and corresponded unto by others right over against them, nor to be of such nearness, and such self-matter or substance, as these have here been shown to be. This conjuncture to have remained for some space after the great and general deluge, and the breach and separation of England from France by the said deluge not to have been caused, is by sundry reasons to be proved.'

Our author here proceeds to show that the Netherlands and adjoining low countries formed, at no very distant period, the bottom of the ocean; in other words, that the German Sea then extended over a considerable portion of the present continent of Europe. He thinks this is abundantly evidenced by the general flatness of the country; by the nature of the soil, which is, to a great depth, an admixture of sand, gravel, and other oceanic silt; and by the fossil remains found far inland, such as beds of shells in the undisturbed position of their growth, the skeletons of large cetacea, and other marine exuviæ. These shells, he maintains, could not have been brought together by the deluge, which was a temporary and violent cataclysm, and would consequently have deposited in a confused and broken manner; but must have grown and increased *in situ* for many centuries after the flood, and ultimately have been deserted by a quiet and gradual recession of the sea. 'An apparent reason,' he continues, 'must then be sought how it hath come to pass that these Netherlands, having been sea, have become to be land; and if so be that this question were moved of such parts only of these countries as Holland and Zealand, and their confines, which may, by the sea's inundation (as before hath been said), easily be drowned and made sea again, it might, by the ordinary answer that the sea doth often gain in one place and lose in another, soon be resolved. But speaking of these parts of Flanders and Brabant, which having been sea, and being become land, can no more, by any inundation, be made sea again; this, I say, requireth an imminent reason to be sought for, the which cannot be found but in the breaking of the German Ocean through that isthmus or narrow passage of land which once conjoined England to France, by which only means the sea, finding out a new course, all the even parts of the Netherlands having (as is aforesaid) before been sea, become eftsoons dry land; even as by common experience we see that watery or moorish grounds are drained dry, when an issue may

be found to lead away the water to some lower channel, pool, or river. And even so, in like manner, this breach in our isthmus being once made, and the sea having been before the said breach somewhat lower on the west side thereof than on the east side, the course of the water, by a natural readiness, taking scope down through this new channel (which before was only a kind of gulf, as is the Red Sea) towards the most huge western ocean, the greater divider of Europe and Africa from the late-found America, it did without all doubt work this great effect; and no way is there else to be found or imagined whereby these seas might be drained or drawn away, to make these former shallow places to appear and become dry land, but only by this way and course.

'That the sea on the west side of the said isthmus was lower than the sea on the east side thereof, is, besides this great work thereby wrought, to be judged by the sundry flats and shallows on the east side, as well on the coast of England as of Flanders; yea, one in a manner lying between Dover and Calais, of about three English miles in length, of some called our Lady's Land; and contrariwise on the west side, no such flats at all to be found, whereby may well be gathered, that as the land under the sea remaineth on the one side lower than on the other, so accordingly did the sea also. It is, moreover, to be judged by the very present course of the sea, for it is observed that the current of the water is more swift down the channel towards the west, than from the west unto the east; old shippers of the Netherlands affirming that they have noted the voyage from Holland to Spain to be shorter by a day and a-half's sailing than the voyage from Spain to Holland. That seas are different in height one from the other, even in places where they have but narrow separations of land between them, is very manifest; as in the case of the Red Sea and the Mediterranean—the former being many feet higher than the latter.

'Another reason there is that this separation hath been made since the flood, which is also very considerable; and that is, that the patriarch Noah, having had with him in the ark all sorts of beasts (all else besides throughout the whole world being destroyed), these, then, after the flood being put forth of the ark to increase and multiply, did afterward in time disperse themselves over all parts of the continent or mainland; but long after it could not be before the ravenous wolf had made his kind nature known unto man, and therefore no man, unless he were mad, would ever transport of that race, for the goodness of that breed, out of the continent into any isles; no more than men will ever carry foxes (though they be less damageable) out of our continent into the Isle of Wight. But our isle, as is aforesaid, continuing since the flood fastened by nature to the great continent, these wicked beasts did of themselves pass over; and if any should object that England hath no wolves in it, they may be answered, that Scotland being therewith conjoined, hath very many, and so England itself some time also had, until such time as King Edgar took order for the destroying of them throughout the whole realm.

'But now, whether this breach of this our isthmus were caused by some great earthquake, whereby the sea, first breaking through, might afterward by little and little enlarge her passage, or whether it were cut by the labour of man, in regard of commodity by that passage, or whether the inhabitants of the one side or the other, by occasion of war, did cut it, thereby to be sequestered and freed from their enemies, must needs remain altogether uncertain; but that our isle hath been continent to France, and that since the deluge, hath here been shown; and although not out of the writings of old authors, yet by evident reasons and markable demonstrations, such as well in this case are to be allowed for sufficient authors; yea, and that before such as might perhaps deliver us some such report upon some other's hearsay, and want such due proofs as here have been alleged to confirm it. And no marvel is it that in old authors no relation of this is found, considering that they must be very old that hereof must make mention; yea, they must have been such as in those times must have lived about these parts, or had good means from these parts to have understood it; both which, considering those so very ancient ages, and the want of knowledge of letters generally of all people in these parts of Europe, cannot possibly be expected.'

Such are the arguments of old Verstegan; and, considering the state of science at the period when he wrote, one cannot help giving him the credit of extraordinary ingenuity and knowledge. After the lapse of a century and a half, Desmarest only followed in his footsteps; and modern geologists, with all their additional facilities, can add but few if any facts of importance to those advanced by the restorer of 'Decayed Intelligence.' It is true that the cause which he assigns for the emergence of the Netherlands, even if it had existence, would only partially account for the result. We must seek for the main cause of this phenomenon in that gradual upheaval of the European continent which is so abundantly demonstrated by the raised beaches found all along the shores of our own island, as well as those of Scandinavia, France, and Portugal. But dismissing altogether the argument drawn from this source, we have still in Verstegan every item of evidence which others have adduced to prove the former geological union of England and France. Recent soundings have shown that the German Ocean gradually becomes more shallow toward the Straits of Dover, till it reaches a minimum of some sixteen or eighteen fathoms; and that so soon as the Straits are passed, the English Channel gradually deepens towards the west, so that the narrow channel between Dover and Calais may be said still to part two great seas. We have evidence, too, that the cliffs on each side are yet subject to a considerable waste—an estimate of which may be formed from the fact, that those at Folkestone have, within the memory of persons living, been washed away to the extent of ten rods. These, and a few similar minutiæ, which tend to corroborate the opinions of Verstegan, are all that can be gathered from recent sources; so that to him may be fairly ascribed the honour of attempting, on philosophical grounds, to demonstrate that at one time 'our country was no island, but a peninsula fixed unto the main continent of the world.'

STORIES AND TRANSLATIONS FROM TASSO.

II.—ODOARDO AND GILDIPPE.

The story of Odoardo and Gildippe gives a pleasing picture of wedded love, which will make it not inappropriately follow the episode of Olindo and Sophronia. Gildippe is one of those warlike heroines in which Tasso seems so much to delight, and which, though a little repugnant to our modern ideas of woman's sphere and character, are yet quite in accordance with the age depicted in the poem. At the period of the Holy Wars, when old age quitted the peaceful fireside for the tumult of battle, and even childhood left its sports to follow arms,* it was not surprising that woman should forget her weakness in the general enthusiasm. And surely, if anything could justifiably allure a woman from the scene of her quiet domestic virtues to a life of warfare, it would be the high and holy motive of conjugal love. Therefore Gildippe seems feminine

* A French boy, of the age of twelve, seized with enthusiasm, travelled through France in, we believe, the reign of St Louis, declaring that the Holy Sepulchre could only be won by children, and that he was sent to command the infantile army. Such was the fanaticism of the time, that numbers of the nobility sent forth their children on this wild exploit. The poor young creatures wandered through Europe, asking at each town 'if this was Jerusalem?' Many of them perished on the way, some were shipwrecked in the Mediterranean, and none ever reached the Holy City.

and loveable, even in the midst of war and carnage; in this excelling even the noble and beautiful Clorinda.

The episode of Gildippe and Odoardo extends over the whole poem. Tasso takes it up at intervals, and then relinquishes it for the history of some more prominent character. The first time the poet alludes to this faithful pair, is when he is enumerating the chieftains of the allied army before Jerusalem. He has been recounting the names of the Lombard generals, and bursts forth thus: 'Oh Gildippe and Odoardo, wedded lovers! whither do ye beguile my muse, already wearied with enumerating so many glorious names? Oh tender pair, united in battle as in marriage-bonds, death only can have power to separate you!' Tasso then continues—

In love's dear school what lesson is not taught?
There learnt Gildippe warrior brave to be;
Ever at her beloved's side her lot,
Their lives entwined, hang on one destiny.
No blow could fall on one, that wounded not
The other, suffering in fond sympathy;
One being struck, the other seems to languish;
One pours forth blood, the other tears of anguish.

After this pleasing description of their perfect union, the loving pair are not again mentioned until the ninth canto, when Gildippe appears in the battle with Soliman. She meets with Clorinda, and the two Amazons—Pagan and Christian—try their prowess in single combat, until Guelph, a German leader, comes to the succour of Gildippe. Tasso is again silent as to the fortune of these wedded lovers, until the last canto, when he describes the concluding and victorious assault of the Crusaders upon Jerusalem. And here the stanzas which precede the continuation of Gildippe's story present to the mind's eye such a vivid and beautiful picture, that, although scarcely connected with the tale, we cannot resist translating them :—

Great was the sight, and wondrous to behold,
When face to face the opposing armies came.
Ranged in long order stood the squadrons bold,
Ready for the assault, athirst for fame;
In the free wind waved every banner's fold,
And tall plumes nodded over casques of flame;
Jewels, devices rich, gold vestures, shone,
And bright steel darted lightnings in the sun.

The multitude of spears on either side
Make both the armies like dense forests seem;
Each lance is laid in rest, each bow-string tried;
The slings are made, the quivering javelins gleam.
While each proud charger scents the battle wide,
And seconds its bold master's glory-dream;
Neighing, it paws the ground in noble ire;
The swelling nostrils breathe out smoke and fire.

Beautiful in its horror is the sight,
From all its fearfulness in rapture born;
Even the loud, harsh trumpets give delight
To the glad ear—even the wild-ringing horn;
The Christian bands, though fewer, seem more bright
In dress and armour, which their ranks adorn;
Clearer their warlike shrill-voiced trumpets sound,
More gaily flash their weapons fair around.

Their trumpets give the signal; loud replies
From forth the Pagan army wild resound;
The Franks, with bended knees and reverent eyes,
In deep contrition kiss the holy ground;
The space that 'twixt the two ranged armies lies
Grows less, then vanishes. Together bound
In deadly conflict, now both wings engage,
And the front troops press on with equal rage.

What noble hand now struck the foremost blow,
And deathless honour from the victory gained?
'Twas thine, Gildippe, thine, which laid all low
The proud Hyrcanus, who in Ormus reigned;
Such glory Heaven, all-seeing, did bestow
Upon a woman's hand. The dart remained
Within Hyrcanus' breast; he, dying, gave
Praise to the hand that sent him to the grave.

The bard then goes on to relate how his fearless heroine slew other chieftains of the Pagan army—Tossiro, Artaxerxes, Alarco, &c.; particularising the manner of their death. These stanzas we pass over, and proceed to the next.

And others, whose bright names the rust of ages
By slow degrees has overcrept, she slew;
The Persians gather where the battle rages,
For the rich spoil that glitters in their view;
But fearful love the faithful spouse engages
To seek his dear one in this danger new;
Now joined in arms, advance the noble twain,
And added strength from that close union gain.

A warfare new and strange they now essay,
This generous and love-united pair;
Each one, of self regardless, strives alway
To guard a dearer life with anxious care;
Gildippe's fearless arm drives far away
The blows that menaced her beloved there;
He, circling round, defends her with his shield,
Willing his life in that fond cause to yield.

This picture of loving union throws a charm over even the horrors of the battle-field. 'While these twain made fierce havoc among the Persians,' continues the poet, 'the king of Samarcand did the like among the Christians. Death followed wherever his tall charger was seen. Happy the Frank who was slain by his weapon, and not trodden under his horse's feet!' Gildippe alone dared to oppose the barbarian monarch. 'She struck him where the diadem on his helmet gleamed in purple and gold; and the haughty head was forced to bend. The Pagan king, in rage and fury, returned the blow, and the Amazon fell senseless; but her faithful husband supported her in her seat. Fortune favoured them, or perchance the king respected her courage, for he ceased the attack. So the bold lion, disdaining a fallen man, looks upon him, and passes by.'

The poem hastens to its close; and Tasso once more leaves Odoardo and Gildippe, and relates the progress of this last great battle. Many stanzas after, he again returns to them in this stanza—

Oh, fair Gildippe! Odoardo true!
Your noble deeds and your most bitter fate,
As far as these my Tuscan rhymes can do,
I, in a stranger's tongue, will consecrate;
That every age may fondly point to you,
And your tried love and valour celebrate;
And every loving heart in after years
Bedew my mournful song with pitying tears.

Gildippe spurred her courser where the Sultan Soliman was carrying death and slaughter among her Christian brethren. She wounded him, and his shield fell to the ground. He, recognising her, called her opprobrious names. 'Better would it be for thee, oh, vile woman!' he cried, 'did thou use the needle and the spindle, than the sword and spear.'

He ceased, and by unrighteous fury driven,
Directs a cruel and impetuous blow,
Which pierces through Gildippe's cuirass, even
To that soft faithful breast which throbs below.
From her weak hand her courser's reins are riven,
Upon the earth she falls, down sinking slow.
The wretched Odoardo sees her fate,
A vain defender, powerless, but not late.

Wo for the tender spouse! Revenge and love
Strive in his heart, and goad him fiercely on;
Love to his dear wife's succour does him move,
Revenge her cruel fortune to atone
Upon the slayer; his true love to prove,
He both these impulses fulfils in one;
His left arm folds her close with fondest care,
The right hand his avenging sword does bear.

But his firm will fails, aided not by might,
Against the powerful foe with victory swelling;
Helpless to shield his love, or meet in fight
Him who her soul chased from its beauteous dwelling;
The faithful arm one fierce blow severs quite,
From its support the burden dear compelling;
Gildippe sinks to earth: he, struck with death,
Soon follows, clasping her with dying breath.

As a tall elm whom the fair matron-vine
In nuptial bonds encircles closely round,
Cloven by axe, or thunderbolt divine,
Falls sudden, bearing with it to the ground
Its spouse, and tears the green leaves whose fond twine
Adorned it, and the clusters rich that crowned;
While its bent boughs a requiem faint are sighing,
Not for itself, but her beside it dying:

So Odoardo falls; but mourns alone
Her now for ever with him joined in fate.
Both strive to breathe one tender dying tone;
Words fail in faint sighs inarticulate:
Their loving gaze meets mingled into one;
Closer they cling together, ere too late;
At once light fades upon each closing eye;
United, up to Heaven the fair souls fly.

D. M. M.

POPULAR INFORMATION ON SCIENCE.

CILIARY MOTION.*

If a common sea mussel—the upper valve being removed—is placed upon the field of a microscope of very ordinary magnifying powers, and its outer edge carefully examined, it will be noticed that sundry minute particles of dust, which have accidentally fallen into the liquor of the shell surrounding the fish, are being hurried, in apparently rapid motion, along the edge, and in other directions over the surface of the creature, by no means in a confused or uncertain manner, but in determinate and unchanging directions. The motion will continue for a length of time after the fish is opened, occasionally becoming very faint and indistinct; and then, by the addition of a little sea-water, recovering its former vigour. After a time, however, it ceases entirely, and cannot then be restored. This motion is termed 'ciliary motion,' from a cause which will be immediately obvious. If now the magnifying power of the instrument is increased, and the observation is directed to the very edge of the floating portion of the mussel—forming a part of the gills—it will then be seen that there are a number of minute hairs, or hair-like processes, which form a fringe to the margin. These are agitated by a series of movements of a very singular character; the motion has been aptly compared to waving of corn before the wind, a comparison which will convey the best idea of the phenomenon to those who are unable to witness it. A series of rapid undulations may be observed to affect these minute organs, as if they were bent before the stream of agitated water which is passing along them, the reverse being true; namely, that the motion of the water and its particles is due to the unceasing agitation of the processes, which act as so many fans to impel it onwards. These little hairs never move in the opposite direction. Thus, if the motion is from right to left, it never changes to one from left to right. This is most remarkable when a small piece of the gills is cut off with a pair of scissors, and examined: it will be seen to move through the water in precisely the opposite direction to the motion of the processes, proving the independence of the movement with reference to the control of the animal, its persistence after a portion only of the membrane is separated from the body, and the unalterable character of the movement. These minute hair-like organs have received the name of 'cilia,' from a Latin word signifying the hair of the eyelids.

Ciliary motion is found in almost all classes of the animal kingdom; from the humbler orders of infusory animalcules, even as high in the zoological scale as man himself. There are probably few other phenomena common at once to the lowest and most exalted classes of organised beings. It is singular to find that its importance to the existence and wellbeing of the creature is inverse to the rank, so to speak, borne in the scale of creation by the creatures in which it has been discovered. In the higher orders of animals—the vertebrated—it performs a useful, but not a very important part, and is found in the lungs and respiratory passages, keeping them clear from obstruction by producing a motion in the direction of the outlet, and impelling the secretions of those organs in that direction in which they will find their easiest escape. It is in the more lowly forms of existence that we are to find examples of its more interesting functions—in the microscopic animalcule, the polype, and the sponge.

The sea mussel is provided with cilia over its entire respiratory surface. Their motion may be watched—and a curious amusement it is—by throwing a little fine charcoal powder into the water. A current is seen to set inwards at several points, and another to emerge from the shell. This may be seen before the shell is opened; when opened, the powder is seen to be conveyed by the water over the gills and their appendages, to penetrate underneath the mantle or cloak, as it is called, and then is carried to the excretory orifice of the animal. It is by this means that the water is renewed over the entire respiratory surface; and when one portion of it is deprived of the oxygen it holds in solution, it is made to give place to another, with a fresh supply of this important ingredient. It is thus, in short, that the mussel breathes: a cessation of its ciliary motion being equivalent to suffocation in higher classes of animals. The fact is inexplicable, but it is a well-known truth, that pure fresh water instantly stops this motion in the sea mussel.

Ciliary motion is not confined, in this creature, to the mature individual, but exists even when the mollusc is in its embryotic state. Take the minute egg, not more than a few days old, and the little neride containing the embryo will be seen revolving, in the fluid which surrounds it, in a spiral manner, describing circles of almost mathematical precision, while the little embryo within also sets up a similar motion, traversing round and round the interior of the neride, like a planet in its orbit. This remarkable phenomenon was first discovered by a celebrated physiologist, Leuwenhoeck,* who writes, 'that he was so much delighted with the spectacle of the young mussels turning round within the egg, that he spent two hours, along with his daughter and his draughtsman, in contemplating it.'

Previous to the improvements now made in the microscope, and in conducting microscopic researches, these movements were attributed to a series of attractions and repulsions exerted on the surrounding fluid by the body of the animal: one of those foolish evasions of a direct confession of ignorance, with which the sciences at a former period were obstructed and encumbered. The motion is distinctly referable to cilia, which have been discovered on the surface of the embryo—the object to which it is subservient is, as in the grown mollusc, the renewal of water for respiration; and it is noticeable that the cilia are placed in that portion of this very young embryo where, at a future time, the gills are to be formed—the gills being its organs of respiration.

In the ova of the frog, the water-newt or salamander, both inhabitants of every reedy pool, and others of the batrachian reptiles, the same curious phenomenon has been discovered; and minute currents of water, in different directions, are seen to cross the surface as soon as the little creature is itself at rest. The surface of the tadpole, which is the young frog in the earliest stage of its existence, is completely covered with cilia. Under a good microscope, the tail of these tiny creatures forms an extremely pretty object. At its margin, the cilia are distinguished by their flashing appearance; and if a little piece is snipped off, it will swim rapidly through the water; or, if ciliated on one side only, it will revolve just as a boat when impelled only by one oar at the side. As the creature advances to maturity, it loses these organs.

In these few instances we have seen illustrations of one of the fundamental functions of the ciliary movement—the renewal of water for respiration; and we can scarcely too much admire the simplicity and efficacy of the apparatus by which this end is accomplished. As the motion is involuntary in most cases, where this is the only object to be gained, the animal is unconscious of the fatigue of respiration—a provision which, when

* For an ample and laborious research into the anatomy and physiology of these organs, the reader is referred to a monograph of Dr Sharpey's, in the Cyclopædia of Anatomy and Physiology.

* Quoted by Dr Sharpey.

the density of the respirable medium, water, is considered, strikes us with peculiar force.

The production of locomotion is the second of the intentions of ciliary movement, and is often combined with another effect of an interesting nature—the capture and prehension of the food. It has been observed, that when a live sponge is watched in its native element, numerous little particles contained in the water are carried at some points into its substance, and are emitted at others. This motion is incessant, and takes place at every part of the surface. The sponge, it may be mentioned, is now thoroughly believed to partake of an animal nature. If closer attention is bestowed upon the creature, the water is seen to pour from the summit of the little conical eminences studding the surface, and to enter in at the numerous minute pores which perforate the rest of the substance. Cilia have not yet been discovered in the sponge; but there is no doubt that, though so minute as to escape the powers even of our best microscopes, they produce these currents — impelling the water through the channels of the sponge to the openings where it escapes, and thus causing an influx to supply its place. In the ovule of this and other zoophytes, cilia have been distinctly made out, which, by analogy, affords strong reasons for believing them to exist in the adult animal. Dr Grant, who has minutely investigated the microscopic structure of sponges, has remarked that the ovum possessed cilia only at one portion of the surface; the tail, so to speak, being uncovered. In consequence of this arrangement, the larger end is directed forwards. When the ovum is detached from the parent, the cilia endow it with the power of locomotion; and it is immediately thus transported to a distance from the parent, swimming straight forwards until it meets with some object to which it can be attached. From that period the cilia produce currents in the surrounding water, for some time serving principally as respiratory agents; and when the animal is matured, becoming, in addition, the means of drawing its food into its substance. How remarkable a provision for the dissemination of the individual! The polype—in which it is also found—and the sponge possessing a fixed character, which assimilates them to the vegetable kingdom, are unable to secure themselves from the overgrowth and localisation of their offspring; but we see that the little ova are temporarily gifted with locomotion to a degree sufficient to carry them to an appropriate situation for their future growth, and thus the same end is obtained—a provision which will immediately suggest its analogue in the vegetable world, where, by many beautiful mechanical contrivances, with others of an almost life-like character, the perpetuity and dispersion of the species are secured. The down of the thistle, and the cilia of the young polype, afford us striking examples of the harmony and wisdom of design pervading the works of Providence.

The adult polype is indebted to these little organs for the capture of its prey. Many polypes, as the Campanularia, or Bell-flower species, are provided with fringes of feelers, or tentacula, surrounding their mouths; these are beset with rows of cilia, which, when the creature is at rest, produce rapid currents and eddies in the water. Their motion is so arranged as to propel the water containing their prey into the mouth of the polype; there another class of cilia whirl them round the throat, and subsequently around the stomach; and such particles as are inappropriate for food are cast back, and appear with the water to form an issuing stream from near the mouth of the creature.

At the bottom of the scale, cilia form appendages of the utmost value and importance, and are found to discharge the three functions already enumerated in the same creature. Infusory animalcules of the simplest class and most primitive structure are covered with them, so as to appear quite hirsute beneath the microscope; their amazing activity—an activity so disproportionate to their size—impelling them to unceasing motion, is solely due to the surface-covering of cilia, which act like so many dwarfish oars to propel the creature along. The comparison, singularly, is more faithful than might at first appear, since the motion of the cilia is precisely similar to the motion of an oar: the process describing a cone in its revolution—the centre of motion being seated at its root, as at the rullock, or row-lock, of the boat.

The wheel infusorial animalcule presents us with a modification of ciliary motion which long puzzled the microscopic anatomists of another day, many of whom were at a complete loss to account for the anomaly, as it appeared to them. The cilia are arranged in circles, upon the end of two little processes, placed generally near the greater extremity of the creature. When the attention is directed to these circles, they bear precisely the appearance of two diminutive cog-wheels revolving on a central axis; their motion is not constant in the same direction, but alternates, and is first in one direction, and then in the opposite. Leuwenhoeck says, 'imagine two wheels set round with points of needles, and moved very swiftly round from west by the south to the east.' We cannot conceive of any such rotatory motion in the living body, as it requires the disunion of the circumference of the wheel from the axis before it can be commenced; only to mention which, is sufficient to show the impossibility of this rotation being real.

It is an optical illusion, to use an expressive, but incorrect phrase, and has been attributed by Dr Sharpey to the effect of a series of undulations passing around the circle, and following each other with great rapidity in every part of the circle, which would convey to the mind the impression of a rotatory motion. Analogous, though differently placed, to the giant paddles of a steamboat, they carry the creature through the water, are subject to its control, and are set in motion or arrested at its pleasure. They produce, when the animalcule fixes itself, circular eddies or whirlpools in the water, whose motion is so vigorous that Leuwenhoeck remarks, that many animalculæ, possessed of tolerably strong powers of locomotion, when they came within them were whirled about for some time; into these vortices, those particles which form the food of the wheel-animal are, as it were, aspired, while it rejects those which are unfit for that purpose, and throws them back. Many of these rotiferæ are not endowed with locomotion, but adhere to the leaves and stems of aquatic plants; and in them the object of the motion is obviously to bring from the surrounding water the food of the animal into its mouth.

It must not be forgotten that the organs we have thus shortly described are, though of such consequence to the creatures they are found upon, yet of an amazingly minute size. In the mussel, where they are said to be rather large, they do not measure more than the thousandth of an inch in length; in some other animals they have been estimated to be as small as the twenty-five thousandth of an inch long; so that, were a hundred thousand cilia laid end to end, they would only measure four inches in length! These are expressions of size, however, which give an indifferent idea of their excessive minuteness to the reader unaccustomed to micrometric research. A more adequate conception may perhaps be formed from the reflection, that a drop of water may contain some thousands of microscopic animalculæ, whose dimensions are so minute as to call for the use of some of the higher powers of the instrument for their detection. Now the general surface of these beings is covered with cilia. Ehrenberg, the zealous and patient investigator of the infusoria, conceives that he has detected at the base of each cilium a minute muscle, which he supposes confers motility to the organ.

It is remarkable, however, that electricity, otherwise an almost universal excitant of muscular contraction, appears to exercise no perceptible influence upon ciliary motion. A Leyden jar has been discharged through a mussel, but the experiment was productive of no visible effect, either in the retardation or acceleration of the movement.

It has been already observed that pure fresh water instantaneously stops the ciliary motion of the sea mussel. This is a general rule with all other marine animals; and it is singular that while pure water exercises this deleterious influence upon it, tolerably strong solutions of certain poisonous drugs, even solutions of prussic acid, opium, belladonna, and strychnia, are quite innocuous. Again, in the vertebrata, a little blood, if smeared over the ciliated membrane, will preserve the motion for some days; but if a little of this fluid is applied to the cilia of invertebrata, it instantly arrests their movement.

Ciliary motion, in cold-blooded animals, endures for an almost incredible period after their death. Thus in the tortoise, it remained for upwards of a fortnight after the death of the creature: it soon ceases, however, after death in the warm-blooded tribes.

On the whole, even in the cursory and imperfect glance we have taken, we may behold in ciliary motion a phenomenon of a very singular and interesting character; generally recognised, however, to exist only by the minority of the students of nature. Still it is a subject which is entitled to a more universal recognition, whether we regard the extensive series of creatures in whom it is found, or as it exhibits the exquisite handiwork of the Creator, or indeed as one of the many wonderful revelations of the microscope.

PHILOSOPHY OF TOYS.

Give a child a small box, and it will probably examine it all round, and in a very short time toss it away. The sight gratified a little, a change of image was desired, and this was the most obvious method of procuring a change. By this act the child brings up the consciousness of exertion; and the sight of a moving thing reproduces former images of motion and activity. Show it that the box opens, and it resumes the study of it—shuts it itself, opens it again; thus reverting from image to image, and delighting in the transformation, as the work of its own hands. It will not be long ere it resorts to the extreme step of throwing it away, and seeking it back to throw away again. From this and all other observations on childhood, we can see that a toy, which has nothing moveable or changeable about it, is a very imperfect thing: it has little source of thought in it. With a finely-finished toy—an effigy of a man, a dog, or a bird—a child will not lose much time ere it treats it as it would a stick, or a spoon, or an old canister; namely, beat the table with it to produce melody, and the ideas of life and motion, and self-exertion—toss it away, or apply it to its mouth to restore part of the pleasure of sucking the breast. It is a very common error to confound toys with ornaments in amusing children. We hear a nurse, on holding up a pretty bauble to an infant, saying, 'See, such a pretty,' as if the child's capacity of enjoyment as yet contained nothing but a love of dazzle. It is common, too, to present to the eye what is not given into the hand—a very thankless indulgence. The sense of beauty and of nice imitation are of late growth. What childhood needs is copiousness of images, resembling and fit for restoring those broad palpable ideas which it has been able to gain—to keep the faculty of identification and recovering of the past working all the day long. It is thus preparing itself for the highest operations of intellect in mature life. By indulging it in noises and rapid motions of all kinds, we are, besides breeding happiness, cultivating ideas of activity, bustle, and life, which are the foundation of the habits of the smart and active workman or man of business, the animated vehement orator, or the stake-all enthusiast.—*Westminster Review.*

STIMULANTS.

The flesh of animals and fermented liquors being much more stimulative than fruit and farinaceous vegetable substances, appear to impart considerably more strength and vigour to the muscular system than the latter; and doubtless while the stimulation lasts, a person is capable of much greater exertion under it; but the only sure way of permanently increasing the powers of the muscular system, is by a natural and nutritious diet, along with judicious exercise. The mode in which stimulants act, is by exciting the nervous energy, and quickening the circulation, and thus producing rapid transformations of the tissues throughout the whole structure; and while these changes are taking place—whether as the effect of animal food, fermented liquors, anger, madness, fever, or exercise—the muscular power is (for the time) increased; but exhaustion constantly succeeds, and will invariably be in proportion to the degree and duration of their action. Exercise, however, is the only safe and legitimate stimulant in a normal state of the system; for it creates a healthy demand for renewal, by promoting the requisite decomposition of structure; while the others destroy the balance between decay and reproduction, and thus lay the foundation of local or general disease.—*Fruits and Farinacea.*

DRIVE YOUR BUSINESS, AND LET NOT IT DRIVE YOU.

Energy and force of character are among the first requisites essential to success in business. A man may possess a high degree of refinement, large stores of knowledge, and even a well-disciplined mind, but if he is destitute of this one principle, which may be termed resolution of soul, he is like a watch without a mainspring—beautiful, but inefficient, and unfit for service. Man was never made to act the part of an automaton, or mere machine. His powers are not designed to move quite so mechanically. He is to act, as well as to be acted upon. He must give life and stimulus to his calling. Is he not endued with a life-giving power, whose emanation is referred to that original source whence alone can be derived all inspiration? Man's efficiency must give character to his business. That employment, upon which is stamped the impress of a living and energetic soul, will do honour to any man, in any place, or at any age. It is poor policy, indeed, to loiter till driven by force. We thereby lose all the pleasures of satisfaction. Voluntary service, urged forward by a determined purpose, will give hopeful assurance if not a full warrant of success, and all the happiness of a just conquest. Behold the sluggish man! His occupation is a worthy one, but it finds him unworthy of the trust. It presses upon him with all the demand of imperative necessity. It finds him but a drone. He is confused by a multiplicity of cares. He is pressed down by a crowd of responsibilities, but makes no generous effort to discharge one of them. Thus his occupation suffers, his family are in want, and that good name, which is better than great riches, is lost. True, man is said to be a creature of circumstances, and he ought to be, in a sense, subject to the superintendence of a leading Providence; but this does not justify inertness of character. Man, by his own decision of character and determined spirit, can do much to remove and surmount the inconveniences and barriers incident to human life. Then be resolute, and both you and your business will 'go on and prosper.'—*Newspaper paragraph.*

LADIES' SHOES.

If shoes were constructed of the shape of the human foot, neither too large nor too small, and making an equal pressure everywhere, corns and bunions of the feet would never exist. But, unfortunately, shoes are seldom made after this fashion; and in ladies' shoes especially, there are generally two signal defects—first, the extremity of the shoe is much too narrow for that part of the foot (namely, the toes) which it is to contain; and, secondly, for displaying as much of the foot as possible, the whole of the tarsus and metatarsus is left uncovered, and the pressure of the shoe in front is thrown entirely upon the toes. The toes are thus first squeezed against each other, and then pushed out of their natural position; and all the projecting points, chiefly where the joints are situated, are pinched and tormented, either by the neighbouring toes, or by the leather of the shoe; and thus it is that corns of the feet are generated.—*Sir Benjamin Brodie.*

We regret to learn that we have been led into a mistake regarding the original source of the maxims on 'Moral Courage' which appeared in No. 122. They first appeared in a London weekly newspaper—*the English Gentleman.*

Published by W. and R. Chambers, High Street, Edinburgh (also 98, Miller Street, Glasgow); and, with their permission by W. S. Orr, Amen Corner, London.—Printed by Bradbury and Evans, Whitefriars, London.

☞ Complete sets of the Journal, *First Series*, in twelve volumes, and also odd numbers to complete sets, may be had from the publishers or their agents.—A stamped edition of the Journal is now issued, price 2½d., to go free by post.

WHAT WOULD THE WORLD DO WITHOUT POKERS?

Considering tongs, shovels, and pokers allegorically, I would say that the two former are useful instruments in their way. The world would get on very indifferently without them; in fact it would relapse into barbarism again were such a calamity to befall us. Shovel and tongs are therefore to be regarded with no ordinary veneration, and cherished with no ordinary care; but they do not, to my mind, possess that attraction, or excite that interest, which I find in everything that a true, genuine, unflinching poker says or does. Let me defend my predilection. Does not the poker come into requisition fifty times for once that we have to call in the aid of either shovel or tongs?—therefore a poker is fifty times as useful as either of the others. Is not the poker plunged into red-hot flames and fervid embers, while the lazy shovel or the awkward tongs escapes with a mere singe of the nose?—consequently the poker, no doubt, is the bravest of the three. And thirdly, the poker is the most indispensable of all; for we can conceive of a make-shift for a shovel, and of a very primitive substitute for a tongs, but there is no conceivable means of doing without a poker. In either of the former events, the fire of the world might, at the worst, only contract in size; but it would burn cheerfully up by the strenuous stirring of a few active pokers; while, if they became defunct, miserable Tellus would cool down to its smouldering centre, and all mundane fire would give up the ghost.

But with a qualification. Pokers add little or nothing to the fire. Under their exertions it may burn fiercely for a time; but without the provision for its continuance, effected by means of the shovels and the tongs, the blaze will eventually die down, and slumber in ashes—out of which no poker can produce genial warmth, until a new race of shovels and tongs supply it with fuel again. Such fires have blazed, have died down, and are slumbering at Athens, at Rome, and in Egypt, and on other ancient hearths, where the sacred element was too ill fed and too sharply stirred to have a long life of it. But, on the contrary, a shovel may cast up the half-consumed embers, and a tongs may lay on heap above heap, a Pelion upon an Ossa, of new fuel, and the result of their united exertions may be to do more harm than good, without our friend's assistance. *Then* all goes well; the flames burst forth, and the fire glows.

Again, each in its place. Should a shovel make the absurd attempt to become a poker, or a poker a shovel, or a tongs either a poker or a shovel, the step is one of signal failure; and each, growing wiser by experience, retires to its appropriate sphere of utility, where, by their mutual co-operation, they are the combined instruments of much and unqualified good.

Now, to extend our allegory—still confining our attention to the class whose unflattering appellative heads this paper—we may consider pokers in their relation to science, to literature, to politics, and to social economy.

Scientific pokers are perhaps, though of the greatest use, of less frequent requisition than similar individuals in other departments of the intellectual world. The periods at which they arrive are more widely sundered than in other instances—a peculiarity which is attributable to the slow progress of the revelation of truth, the especial work of the shovels and the tongs. And as to poke a scanty fire would be to extinguish it, so we may find that periods of comparative repose ensue in the exertions of this description of pokers—a repose which may endure for years, so as to make the blaze intermittent, and thus to allow sufficient time for the re-accumulation of fuel. The poker, however, must awake out of sleep. Vain are the labours of Philosopher Tongs; vainly does he pull forth out of darkness and obscurity the fresh materials which form the support of the scientific fire before whose altar he worships; vain are his operose calculations; vain his delicate experiments; vain his profoundest researches. He heaps up fuel upon a fire which will never warm him—which will never return him, while he lives, one grateful ray of generous heat for all his assiduity; and he may descend to the grave, as many have done before him, with the melancholy spectacle of the mere smouldering of the fire he adored before his eyes, if some vigorous poker does not step in to its rescue. Watch the poker at work. Observe how carefully are all the defunct ashes raked away. 'Tis to no purpose to hammer at the fuel, as some unwise pokers do; the fire burns never the better until all the old, decayed, smothering dust is removed. Frequently the Philosopher Tongs will put his fuel on in his own obstinate way, the consequences of which are seriously detrimental; but the poker arranges them afresh—sometimes, perhaps, with an over-rude hand or over-sharp blow. Then the fire springs up, the air breathes upon it, a new light flashes upon it all, and it lives; and now and then—though this is by the by—the philosopher, when he has become Old Tongs, before he dies, may thank his stars that science has its pokers.

The literary poker is a stirring and eminent individual, and has often work enough to do to keep all alive. The antiquarian old shovel, Dr Dryasdust, may grub on among the cold embers of a former fire, from early youth to hoary old age, despising the assistance of fresher material, and deluding himself into the belief—one of a remarkably determined nothing-like-leather-ian character—that dead ashes are the most appropriate fuel; while he and Young Tongs may engage in a furious and unchristian civil war with one another upon the relative value and importance of ancient and modern

truth, until a sickly, waning, flickering spark may be all that remains of the element which is the object of their mutual veneration; when timely aid comes from the poker. Stirring out all the useless portions of Dr Dryasdust's labours, combining all that is of value in them with the more fiery matter supplied by Young Tongs, he causes the spark to take heart of grace again. What is good of the past and precious of the present unite together, and, in their combination, cherish the blaze until it glows, and becomes a blessing and a benefit to mankind.

The political poker is perhaps more frequently in the fire than any other, and may be said to be an organ of much good, alloyed with some little evil. He is a character who, by his incessant commotions, must always command public attention. He had rather be the stirrer up in an indifferent cause, than be laid down in inglorious inactivity. This is his infirmity. He takes, unfortunately, too intense a pleasure in exciting the coals; and, not content with clearing out dusty old abuses, and administering a seasonable blow to those of modern growth, he is only too well pleased, and too much in his element, when he has succeeded in producing a roaring fire in the constitution, until at length the heat he has contributed to create inflames and burns his own fingers. Pokers of this class abhor the name of stagnation. No smothering up of any flame, no hidden sparks, no stoppage of any of the vents, no quiet going to sleep of a few inoperative measures for them! Whether he is detected in the thunderings of the press, or in the office of chief poker to the Houses of Lords or Commons, Mr Poker is the same fire-loving individual; and Premier Tongs with his new imposts, and Secretary Shovel with his old ones, stand in common and uncommon dread of his onset, as he partakes of the Malay disposition, running a muck alike upon friend and foe. I do not think insincerity is a fault of political pokers in general; I believe them to have a single eye to the service of their country—a virtue which would redeem them from the condemnation of errors more grave than the effects of an overprecipitancy of disposition. If Premier Tongs wishes to overload the constitutional fire with some heavy expenses, and lays on load after load, until the enfeebled flame has scarcely a crevice left open, up starts the chief Commons poker, and knocks away piece by piece, until some more moderate amount is left, when he sits down again, getting no thanks for his efforts, and no applause for his labour, but supported by an invincible determination to struggle to the last for the public weal. Or sometimes the poker steps into the accounts of public offices, stirring out some half-hundred sleepy young sinecurists, or giving a seasonable rap on the head to as many lazy old clerks and officials, and carrying blank dismay into the remotest corners of the departments, by dismissing some of the dustiest of the cinders and the most stylish of the young sparks. Then, being ridded of the unnecessary incumbrances, things carry on bravely, and the poker, rewarded as before, lays himself by for the next emergency. The tendency of the political poker, we have admitted, may be to agitate too often, to turn things topsy-turvy too frequently. It is a venial fault; for Premier and Secretary Tongs and Shovel are labourers of such indefatigable dispositions, as to provide him with ample occupation at all times. Political pokers are a select class: few are bold enough to undertake, or successful in undertaking, the arduous office. Few, moreover, possess integrity of principle in that high degree which can alone constitute an effectual political poker. It is a degree of principle which, where they are productive of mischief, cannot overlook the errors of a friend, or spare those of an adversary. But I must add, that it is a class apt to attach to itself an overweening sense of its own importance—the not unnatural consequence of the immense effects they are conscious of producing. Whether to the political poker this self-adulation is an equivalent for the solitude of his isolated condition, we must leave to metaphysicians, or to other moralists, or to himself, to determine.

In the social economy, we select two examples of pokers for examination; they happen to be of opposite sexes. I regret to say that they are of opposite characters—the one stirring up schism and mischief, the other being an instrument of unwearied service in the better cause of promoting the good, and advancing the improvement, of the circle it is found in. Both classes exist in large cities, but come into greatest prominence in the county towns and villages of our empire, where the baneful influence of the one, and the beneficial efforts of the other, are well-marked. As a general rule, the class of pokers we reprehend is of that sex whose more especial office it is believed to be to heal the wounds of an enemy, and to pour balm into the offended ears of estranged friends. Every village is unfortunate enough to possess one or more of such pokers. Their operations are destructive of peace and love; they kindle fiery flames in happy families; they set old friends at fierce enmity one with another; they spread abroad, heedless of the consequences, the burning fire of scandal; and perpetrate such other acts of an incendiary nature, as to set town, and village, and hamlet in a diurnal combustion, making that which was Plato's astonishment—that a single day should pass without a universal conflagration—a circumstance of the rarest possible occurrence. Many heartburnings do these ruthless pokers keep alive, which would otherwise quietly go out—spending their unhappy lives in creating such uncomfortable warmth of feelings around them, as to keep the little village, and everything it contains, glowing like an oven. I make one excuse for such pokers: I cannot believe it to be their deliberate intention to set people by the ears; I think they are unhappily ignorant of the dangerous consequences of the slightest poke in some fires fed with very combustible fuel. Generally, it is my opinion they have no idea of the flame they have fanned up, until they find, in perplexed astonishment, it enkindles around themselves.

The second order of pokers are of a greatly diverse character. They are to be found in the public men of the village. Perhaps there is not one village nestled in the deep recesses of our land, which has not its public man; and a happy possession it is to have, as he is the life of the place. The village poker is a person of much information, of considerable tact, and of an untiring spirit of activity; a person who, even out of the heavy clodpoles that surround him, will evoke some latent spark or two of beneficial fire. If, during his absence, the lazy corporation—oppressed with whisky fumes, obscured with tobacco smoke, and overloaded with business—have passed the unanimous resolution of putting off to the next meeting that which was the professed object of this—the audit of the town accounts, and the speech of the town-clerk—some lucky event directs the poker there; the aspect of things brightens up at once. Two of the most factory-chimney-like of the pipes are put out in no time; the necessary business does not look so bad after all; half an hour sees it in a fair way of being satisfactorily concluded; and in an hour's time, to the immense amazement of the old gentlemen, all is completed, and a vote passed to demolish half of an old street, and to rebuild it with the surplus fund—an event which five out of the number had been heard, on a previous occasion, to assert as likely to occur synchronously with the upspring of the fifth generation therefrom. It was the poker who organised the gas company, and laid down the pipes, and illuminated the town. It was the poker who was actually president of the water-company; and succeeded, after five years' declamation against the water-carts, in laying on water *ad libitum* in every house in the town. It was the poker who pushed his zealous inquiries into the misappropriation of trust funds of the orphan school, who kicked the nefarious treasurer out of his well-feathered nest, and sent away the secretary with an uncomfortable flea

in his ear; and thereafter doubled the number of orphans admitted. It was the poker who demolished three out of the five turnpike-gates, so long looked upon as the natural defences of the village. In a word, the village poker is the mainspring of every movement which will ameliorate the condition of his poorer townsmen; nor less does he regard the real advancement of the happiness of the richer ones. He kindles charity in these, he warms up gratitude in those; and looking only at his face, suffused with overbrimming kindness and animation, who will hesitate to pronounce him to be a happy and a useful man?

To drop the metaphor here. There is surely some gleam of truth to be found under its guise, which may redeem these pages from the character of frivolity. Some of these emblematic personages find their originals in the world around us, moving in spheres far remote from one another, but all tending to advance our condition, and to keep us up to our epoch. Few will deny that there is a natural tendency to a relapse to be found in man, and strikingly illustrated in nature. Thus the exquisitely pencilled flower, perfected by art, not only produces seeds which form vile and worthless florets, but even when propagated by division, ultimately degenerates, and is lost. Nor does the history of the human race furnish us with less remarkable evidence of this law, as testify the present condition of the enslaved Egyptian, the effeminate Roman, and the spiritless Greek; and we possess more modern examples of such lapses into barbarism. While, then, we cannot too much overvalue the unceasing efforts of the classes of men who may be called shovels and tongs, to supply man with everflowing springs of knowledge, we are not, on the other hand, to depreciate or to forget that it is by the exertions of a few active minds that such knowledge is made available to mankind, and that a steady advancement in the sciences, in literature, and in civilisation is secured.

These are spirits possessed of, rather, it may be said, gifted with, unusually clear perceptive powers; well able to separate the chaff from the good grain, and endowed with a peculiar aptitude of arranging, and placing in their appropriate order and bearing, the facts which fall beneath their notice. It is by this means that a new, and generally the correct, light is thrown upon subjects which, without such aid, would continue to retain, and might possibly increase, their obscurity. Not that the class I have called pokers is an unmixed class; not that, by their individual exertions, such men do not contribute fresh knowledge to the mass; but that the most striking characteristic of such individuals lies principally in their discharging that office which it has been the intention of this paper to explain—poking.

The science of chemistry furnishes us with an instance in point. For years past it had been growing in importance in the accuracy of its researches, and in the number of its fundamental truths; yet it lay in a condition of stagnation, or nearly so, with reference to its practical utility in agriculture, and in the science of medicine, until Baron Liebig arose; and by the new light by him disclosed, by the peculiarly ingenious manner in which well-known facts were arranged by him, and reasoned upon, and by the striking inferences he has drawn from thence, he has given an impulse to the science in these two important departments which will continue to be felt, and whose beneficial effects cannot fail to endure, for a considerable period. Now, Baron Liebig I recognise as an eminent instance of a poker.

Such men are and will be continually born into our world before their epoch; and while we admit that the general development of truth is gradual, we contend that in the class we have considered is to be recognised an order of men created to expedite its progress, and to usher in the spring of a day of knowledge still remote. The elements of the moral world, like those of the physical, are metaphorically of a combustible character. Under ordinary circumstances, combination takes place only at the surface, and then ceases; things now require turning about, and this commixture devolves upon the pokers; and immediately fresh compounds are produced; and so on from age to age.

Again, the ashes of a previous generation have been, and are, and will yet be, great obstacles to the progress of information. Preconceived opinions and hereditary prejudices—bequeathed, like the Spanish chess-games, from father to son—must long continue to stop the advance, and stunt the growth, of knowledge. For their removal we are to look to the class of men here allegorised. It was the dust and ashes of an Aristotelian philo-sophistry which blinded and enthralled the world for two thousand years, until Francis Bacon thrust it aside.

I would drop this paper here, as a stone into water, believing that it will create around it circles which will extend infinitely wider than the first little ring from whence they originate. As the experience and observation of every reader must furnish him with many other instances of the order of men I have commemorated, he may be induced perhaps, after such reflection, to assent to the implication contained in my question, and exclaim with me—'What *would* the world do without pokers?'

GERMAN EMIGRATION.

Few subjects are more interesting, and none more important, than the process by which the surplus population of Europe is every day being poured into the unpeopled districts of the old and new world, forming there the framework of future nations, which are doubtless destined to carry our knowledge and the traditions of our society to a period when we ourselves may no longer exist as nations. Hitherto the stream has flowed principally from the United Kingdom, particularly Ireland, which the difficulty of obtaining subsistence must, for many years to come, make an emigrating country. An unexampled peace of thirty-one years' duration has likewise had its natural effect on the continent, by the immense increase of population, to stimulate emigration; but more slowly and partially than among us; and it is only within the last ten years that it has grown to an amount, and assumed a direction, which promises serious results.

France has not for the last century been an emigrating country, which may mainly be accounted for by the less independent and energetic character of the people; the greater comfort of the peasantry, who are almost all small proprietors, farming their own lands; and, above all, the enormous chasm in the population left by the revolutionary wars, which alone are computed to have swept away thirteen millions of Frenchmen. Even in Algeria, which, from its nearness to France, and from the constant premiums, in the shape of land for nothing, held out by the government, was most likely to attract native emigration, the number of French is considerably inferior to that of the other settlers. The majority are Spaniards or Maltese. Belgium has twofold resources in its manufactures and admirable agriculture, which have hitherto sufficed for the employment and support of its dense population; and the other European states contain in themselves, for the most part, large tracts of thinly-peopled or unoccupied land, sufficient to sustain the surplus mouths for a number of years to come.

Germany is the only other country, besides Great Britain, from which emigration takes place on a great scale, and is likely to lead to important results. Since the year 1840, she has sent out annually 60,000 settlers; about our own average. In the present year, the number is stated in the English papers at 80,000. It is very probable that this number will continue for the future, and even increase, as the predisposing causes are not occasional, but permanent, in the subsisting state of the

country. The reasons which are all-powerful there, are not the same as actuate us. The results, too, are very different; and their great extent, with the little attention hitherto bestowed on the subject, will be our best apology for considering it a little more in detail.

One great peculiarity in German emigration is, that it is directed exclusively to the United States of America. Some have been tempted to settle at the Cape of Good Hope, in Brazil, or in Algeria; but the number is inconsiderable. New Zealand has also been tried; but with no great promise of success. Perhaps the greatest number of Germans collected in any one place out of their own country is at Paris, where, among other trades, there are two thousand boot and shoemakers alone, and, at the lowest computation, four thousand master tailors and journeymen. It is curious that the Germans, to whom we certainly attach no distinguishing ideas of elegance, should have so completely absorbed the business of adorning the outer man in the city which prides itself, above all others, on its taste. So far is this carried at present, that the native French aspirants for custom are in the habit of appending to their names a German suffix. Pierre becomes Pierremann; Lenoir, Lenoirmann; Paul, Paullmann, &c.; just as many a tyro in the musical world among us ends his name in *ti* and *tini*, without having a drop of Italian blood in his veins. But these Germans at Paris can hardly be classed as emigrants, since most of them are young unmarried men, who merely go to France to accumulate, in the least possible time, as much as will set them up in business at home. The chief emigration to America at present is from the Upper and Middle Rhine, the Grand Duchy of Baden, Wurtemburg, the two Hesses, and Bavaria. In Bavaria especially, whole village communities sell their property for whatever they can get, and set out, with their clergyman at their head. 'It is a lamentable sight,' says a French writer, 'when you are travelling in the spring or autumn on the Strasburg road, to see the long files of carts that meet you every mile, carrying the whole property of the poor wretches, who are about to cross the Atlantic on the faith of a lying prospectus. There they go slowly along; their miserable tumbrils—drawn by such starved, drooping beasts, that your only wonder is, how they can possibly hope to reach Havre alive—piled with the scanty boxes containing their few effects, and on the top of all the women and children, the sick and bedridden, and all who are too exhausted with the journey to walk. One might take it for a convoy of wounded, the relics of a battle-field, but for the rows of little white heads peeping from beneath the ragged hood.' These are the emigrants from Bavaria and the Upper Rhine, who have no seaport nearer than Havre. Those from the north of Germany, who are comparatively few in number, sail mostly from Bremen. The number of these likewise is increasing. From 1832 to 1835 inclusive, 9000 embarked every year from Bremen; from 1839 to 1842, the average number was 13,000; which increased to 19,000 in the year 1844.

Society in Germany is so much more rudimentary than in England, that it is remarkable to see this same tendency exhibiting itself in the two nations. In Germany population is comparatively sparse, in Great Britain it is dense; in the one there is great wealth and profound poverty, in the other the extremes of property rarely exist; the one has a large and dominant town population, the other has fewer towns in proportion than any country in Europe; the one teems with political activity, in the other political activity is not, or at least has not yet taken to itself a practical presence and a name.

The dread of destitution is a motive to emigrate in Germany, as in England; but not a principal motive. This is clear from the fact that the emigration does not take place in those districts where there is most want, but exists equally where population is dense, and where it is thinly distributed. In Westphalia, for instance, a great number of small proprietors have lately sold their lands, and sailed for America—each of whom, it is reckoned, has taken with him at least thirty pounds' worth of goods and money. The Bavarians emigrate alike from the Rhine country, where population is thickly clustered together, and from the upland districts, where there are not eighty inhabitants to the square mile.

The one great cause of this almost national movement is the desire for absolute, political, and religious freedom; the absence of all restrictions upon the development of society; and the publication of opinions which cannot be realised at home. The great agitation in society, caused first by the French domination, and then by the convulsive rise against it, has never passed away. In that gigantic struggle, when everything rested on the popular soul, the bonds of privilege and class were tacitly abandoned, and could never thenceforth be reunited as before. The promises of having constitutional governments at that time, made by the sovereigns to their subjects, have been but partially fulfilled. There is nothing that can be called oppression on the part of the governments; the mass of the people are well satisfied with their rulers—and with reason, for the actual executive has been generally excellent; but there are many restrictions, and the young, the restless, and the imaginative thirst for their ideal freedom, and many of them seek for the realisation of Utopia in America. Complete religious equality is a still more powerful want in a country where Catholics and Protestants are so nearly balanced, and where the state of parties is such, that the minority in faith, though nominally equal in law, must always live under the cold shade of an alien creed. This of itself has urged many across the Atlantic. It is probable that the present schism among the German Catholics will add to the number of the emigrants from religious causes.

Another motive has been the great success of some of the earlier settlers. The Moravians and Shakers, who have emigrated from Germany, have worked wonders in some parts. In 1815, the Separatists, another religious body, sometimes called Rappists, from their head, M. Rapp, sailed from Wurtemburg with a capital of only L.1200 pounds, and formed a settlement on the Ohio. At the present time, the real property in land belonging to the society is reckoned at L.340,000, exclusive of personal property, and a large sum of money in the funds. The success of the colony of Zoar has been equally striking. It was founded twenty years ago by a few families with a scanty capital, and now possesses 40,000 acres of land, a disposable capital of L.100,000, and an immense quantity of machinery and stock, foundries, tan-pits, and mills in abundance. This extraordinary affluence is because these two colonies were founded on the principle of a community of property, and have been throughout under a strict religious government. But the present emigrants forget this; and looking only at the prosperity achieved, they think that as the Moravians and Rappists have succeeded, they must succeed to the same extent, without either the same capital or self-denial.

It is not to be expected that the German governments should look with indifference on this constant and increasing defalcation of their subjects. It is not, as we have said, the very poor that emigrate; they cannot, in fact; but it is those who have some little to spare. Every emigrant is reckoned to take with him equal to L.25 of English money, which would give an annual subtraction of L.1,500,000 pounds—a serious loss in a country which has little superfluous capital. And be it remembered that this is all loss. Lord Brougham said, in one of his speeches, with equal truth and force, of the English emigrants, that not an axe falls in America but sets in motion a shuttle at Manchester. But the Germans in America consume English, not German commodities, and remit nothing to Germany in the shape of produce. As it is hopeless to try to stop the tide, the German governments have exerted themselves of late to turn it in a direction nearer home

—to Hungary and the countries along the Lower Danube, where there is an immensity of rich virgin soil untouched. Austria, in particular, is naturally very much interested in establishing a German population in Hungary, to balance the Slavonic element; and with this view a number of pamphlets have been drawn up and circulated, with a comparative view of the advantages of emigration to Hungary and the United States, but as yet with little effect.

Another plan of an opposite kind at present in agitation, from motives of humanity as well as expediency, is, that the Zollverein (customs' union) should appoint a resident agent at Washington, to be at the head of the consular body, and in connexion with the emigration committee sitting at Bremen, so as to have some effective control over the emigrants. Many of them have been grievously cheated by speculators, and the accommodation on board the emigrant ships generally is very bad. The Zollverein is to convey them in its own vessels, and not less than two hundred at a time; which would be a general saving on the present rates of from twenty-five to thirty per cent. On their arrival, the consuls are to take charge of them, and see them conveyed safely to their destination. To pay the expenses of the passage, and for the foundation of pauper colonies, the Zollverein to devote an annual sum of not less than L.80,000. Such is the outline of the plan; which is likely, in part at least, to be carried into execution.

The most important point connected with the subject, is the influence which such an annual influx of a foreign population, speaking the same language, and nearly all professing the same (the Roman Catholic) faith, cannot fail to exercise upon the future destinies of the United States. At present, as the whole stream is poured into the same country, the annual number of German settlers considerably exceeds those from Great Britain and Ireland. There are of the former resident in America, according to the last census, about four millions. But this is not all. If, like the English and Irish who cross the Atlantic, they were to spread themselves over the continent indiscriminately, wherever there was the greatest chance of success, the whole, in the course of one generation, or two at most, would blend insensibly with the majority. But they carry out with them all the passions, prejudices, and dispositions of the fatherland, and keep them immoveably. The great object of each family that successively arrives, is to fix itself as near as possible to its relatives, if it has any; if not, to its countrymen. Every settlement thus becomes the nucleus of a pure German circle, which is born, marries, and dies within itself, and with the least possible admixture of Anglo-Americans. In the reign of Queen Anne, a numerous colony from the Palatinate settled on the upper waters of the Hudson, where, after a century and a half, their descendants remain to this day a separate people. 'These honest folks,' says one of their countrymen, 'though living amongst Anglo-Americans for the third and fourth generation, can neither read nor write the English language; and adhering to their axiom, never to become Irish (thus they designate the Anglo-Americans, who take their revenge by nicknaming them Dutch), they are contented with their own German idiom.'* It is the same with them everywhere. Chance or preference directed the first settlers towards Pennsylvania. To Pennsylvania, accordingly, the stream has steadily set ever since; and the result is, that the German population of that state already balances the Anglo-Saxon; and, in the adjoining state of Ohio, stands as three to seven. Next to these, the greatest number is found in Maryland, Indiana, Illinois, and Missouri, neither going far to the north or south of the same parallel. In most of these states, the debates in the houses of representatives and the laws are printed alike in German and English. If this emigration continue in its present extent and direction, and in the course of time—what is sufficiently probable—a disruption of the great American confederacy should take place, a second Germany will have arisen beyond the Atlantic, and monopolised, along the head waters of the Delaware and Ohio, the possessions of the children of Penn.

* North America and the United States as they are. London: 1826.

DICKENS'S PICTURES FROM ITALY.*

A BOOK on Italy, by Mr Dickens. The reader of the Boz novels will not expect, from such a production, anything beyond the impressions of a sprightly, intelligent mind, communicated with quaint, imaginative pleasantry—and he will not be disappointed. The book really is, as its author unassumingly describes it, 'a series of faint reflections—mere shadows in the water—of places to which the imaginations of most people are attracted in a greater or less degree.' Of classical enthusiasm there is none, of archæology nothing, of art mania hardly a vestige. It is the externe only which is here touched on. Nor *could* the book be otherwise, for it is hardly bigger than *The Cricket on the Hearth*.

The author enters Italy by Genoa, visits the Lombardy cities, tarries at Rome and Naples, and returns by Florence. Chit-chat about roads, conveyances, inns, is everywhere prominent; but then it is so much better than the chit-chat of common-minded persons. The best part of the book, to our apprehension, is that regarding Rome, which our author saw at the beginning of February (1844), during the festivities and frivolities which precede Lent. His fidelity to the minute and familiar here serves him in good stead; and the result is a description which we *feel* to be like what would strike our senses in the actual scene. The first impression at a little distance was, that Rome resembled London: 'innumerable towers, and steeples, and roofs of houses rising up into the sky, and high above them all one dome.' On the side of the town by which he entered there were no ruins or other tokens of antiquity. 'There seemed to be long streets of commonplace shops and houses, such as are to be found in any European town; there were busy people, equipages, ordinary walkers to and fro; a multitude of chattering strangers. It was no more *my* Rome—the Rome of anybody's fancy, man or boy—degraded, and fallen, and lying asleep in the sun among a heap of ruins—than the Place de la Concorde in Paris is. A cloudy sky, a dull cold rain, and muddy streets, I was prepared for, but not for this; and I confess to having gone to bed that night in a very indifferent humour, and with a very considerably-quenched enthusiasm.'

The Grecian architecture of St Peter's, the character of many of the decorations, the tawdry style in which many of the ceremonials are arranged, disappoint him. The very persons engaged do not appear to regard the religious shows of this time with respect; hence they do not look real, and this adds to the disappointment of the stranger. We come by and by to the Monday afternoon of the carnival; and here the Boz power is pretty fully called out. The author and his party get into a carriage, whose proper decorations are all lined with white cotton or calico, and which contains basketfuls of nosegays, and sacks of sugar-plums. This, with wire masks for the face, is the proper style in which to appear on that occasion: the reasons will be seen. 'The Corso,' says Mr Dickens, 'is a mile long; a street of shops, and palaces, and private houses, sometimes opening into a broad piazza. There are virandas and balconies, of all shapes and sizes, to almost every house—not on one storey alone, but often to one room or another on every storey—put there in general with so little order or regularity, that if, year after year, and season after season, it had rained balconies, hailed balconies, snowed balconies, blown balconies, they could

* Published for the author by Bradbury and Evans, Whitefriars, 1846.

scarcely have come into existence in a more disorderly manner.

'This is the great fountain-head and focus of the carnival. But all the streets in which the carnival is held being vigilantly kept by dragoons, it is necessary for carriages, in the first instance, to pass in line down another thoroughfare, and so come into the Corso at the end remote from the Piazza del Popolo, which is one of its terminations. Accordingly, we fell into the string of coaches, and for some time jogged on quietly enough; now crawling on at a very slow walk, now trotting half-a-dozen yards, now backing fifty, and now stopping altogether, as the pressure in front obliged us. If any impetuous carriage dashed out of the rank, and clattered forward, with the wild idea of getting on faster, it was suddenly met or overtaken by a trooper on horseback, who, deaf as his own drawn sword to all remonstrances, immediately escorted it back to the very end of the row, and made it a dim speck in the remotest perspective. Occasionally we interchanged a volley of confetti with the carriage next in front, or the carriage next behind; but as yet, this capturing of stray and errant coaches by the military was the chief amusement.

'Presently we came into a narrow street, where, besides one line of carriages going, there was another line of carriages returning. Here the sugar-plums and the nosegays began to fly about pretty smartly; and I was fortunate enough to observe one gentleman, attired as a Greek warrior, catch a light-whiskered brigand on the nose (he was in the very act of tossing up a bouquet to a young lady in a first-floor window) with a precision that was much applauded by the bystanders. As this victorious Greek was exchanging a facetious remark with a stout gentleman in a doorway—one-half black, and one-half white, as if he had been peeled up the middle—who had offered him his congratulations on this achievement, he received an orange from a house-top full on his left ear, and was much surprised, not to say discomfited—especially as he was standing up at the time; and, in consequence of the carriage moving on suddenly at the same moment, staggered ignominiously, and buried himself among his flowers.

'Some quarter of an hour of this sort of progress brought us to the Corso; and anything so gay, so bright, and lively as the whole scene there, it would be difficult to imagine. From all the innumerable balconies—from the remotest and highest, no less than from the lowest and nearest—hangings of bright red, bright green, bright blue, white, and gold, were fluttering in the brilliant sunlight. From windows, and from parapets, and tops of houses, streamers of the richest colours, and draperies of the gaudiest and most sparkling hues, were floating out upon the street. The buildings seemed to have been literally turned inside out, and to have all their gaiety towards the highway. Shop-fronts were taken down, and the windows filled with company, like boxes at a shining theatre; doors were carried off their hinges, and long tapestried groves, hung with garlands of flowers and evergreens, displayed within; builders' scaffoldings were gorgeous temples, radiant in silver, gold, and crimson; and in every nook and corner, from the pavement to the chimney-tops, where women's eyes could glisten, there they danced, and laughed, and sparkled, like the light in water. Every sort of bewitching madness of dress was there. Little preposterous scarlet jackets; quaint old stomachers, more wicked than the smartest boddices; Polish pelisses, strained and tight as ripe gooseberries; tiny Greek caps, all awry, and clinging to the dark hair, Heaven knows how; every wild, quaint, bold, shy, pettish madcap fancy had its illustration in a dress; and every fancy was as dead forgotten by its owner, in the tumult of merriment, as if the three old aqueducts that still remain entire had brought Lethe into Rome upon their sturdy arches that morning.

'The carriages were now three abreast; in broader places four; often stationary for a long time together; always one close mass of variegated brightness, showing the whole streetful, through the storm of flowers, like flowers of a larger growth themselves. In some, the horses were richly caparisoned in magnificent trappings; in others they were decked from head to tail with flowing ribbons. Some were driven by coachmen with enormous double faces, one face leering at the horses, the other cocking its extraordinary eyes into the carriage, and both rattling again, under the hail of sugar-plums. Other drivers were attired as women, wearing long ringlets and no bonnets, and looking more ridiculous in any real difficulty with the horses (of which, in such a concourse, there were a great many) than tongue can tell or pen describe. Instead of sitting *in* the carriages, upon the seats, the handsome Roman women, to see and to be seen the better, sit in the heads of the barouches at this time of general license, with their feet upon the cushions; and oh the flowing skirts and dainty waists, the blessed shapes and laughing faces, the free, good-humoured, gallant figures that they make! There were great vans, too, full of handsome girls—thirty or more together perhaps—and the broadsides that were poured into and poured out of these fairy fireships, splashed the air with flowers and bonbons for ten minutes at a time. Carriages, delayed long in one place, would begin a deliberate engagement with other carriages, or with people at the lower windows; and the spectators at some upper balcony or window, joining in the fray, and attacking both parties, would empty down great bags of confetti, that descended like a cloud, and in an instant made them white as millers. Still carriages on carriages, dresses on dresses, colours on colours, crowds upon crowds, without end. Men and boys clinging to the wheels of coaches, and holding on behind, and following in their wake, and diving in among the horses' feet to pick up scattered flowers to sell again; maskers on foot (the drollest, generally) in fantastic exaggerations of court-dresses, surveying the throng through enormous eye-glasses, and always transported with an ecstacy of love on the discovery of any particularly old lady at a window; long strings of Policinelli, laying about them with blown bladders at the ends of sticks; a wagonful of madmen, screaming and tearing to the life; a coachful of grave Mamelukes, with their horse-tail standard set up in the midst; a party of gipsy-women engaged in terrific conflict with a shipful of sailors; a man-monkey on a pole, surrounded by strange animals with pigs' faces and lions' tails, carried under their arms, or worn gracefully over their shoulders; carriages on carriages, dresses on dresses, colours on colours, crowds upon crowds, without end. Not many actual characters sustained or represented, perhaps, considering the number dressed; but the main pleasure of the scene consisting in its perfect good temper; in its bright, and infinite, and flashing variety; and in its entire abandonment to the mad humour of the time—an abandonment so perfect, so contagious, so irresistible, that the steadiest foreigner fights up to his middle in flowers and sugar-plums like the wildest Roman of them all, and thinks of nothing else till half-past four o'clock, when he is suddenly reminded (to his great regret) that this is not the whole business of his existence, by hearing the trumpets sound, and seeing the dragoons begin to clear the street.'

Our author next describes the race—always an important feature of the carnival. The horses, at a given signal, are started off. 'Down the live lane, the whole length of the Corso, they fly like the wind, riderless, as all the world knows, with shining ornaments upon their backs, and twisted in their plaited manes, and with heavy little balls stuck full of spikes dangling at their sides, to goad them on. The jingling of these trappings, and the rattling of their hoofs upon the hard stones; the dash and fury of their speed along the echoing street; nay, the very cannon that are fired—these noises are nothing to the roaring of the multitude, their shouts, the clapping of their hands. But it is soon over—almost instantaneously. More cannon

shake the town. The horses have plunged into the carpets put across the street to stop them; the goal is reached; the prizes are won (they are given in part by the poor Jews, as a compromise for not running foot-races themselves); and there is an end to that day's sport.'

Mr Dickens's impressions, from the numberless churches and their contents—pictures, and other decorations—are not favourable. The English common-sense seems to be everywhere a rebel. The scene in and around the churches is always the same—a mixture of respect and indecorum. 'In one, a lady got up from her prayers for a moment, to offer us her card as a teacher of music; and in another, a sedate gentleman, with a very thick walking-staff, arose from his devotions to belabour his dog, which was growling at another dog, and whose yelps and howls resounded through the church as his master quietly relapsed into his former train of meditation—keeping his eye upon the dog at the same time, nevertheless.' One thing everywhere present—the money-begging box. Even art has its ludicrous side. A flight of steps, leading to the church of Trinita del Monte, is the place of resort for the artists' 'models,' and there they are constantly waiting to be hired. 'The first time I went up there, I could not conceive why the faces seemed familiar to me; why they appeared to have beset me for years, in every possible variety of action and costume; and how came it to pass that they started up before me, in Rome, in the broad day, like so many saddled and bridled nightmares? I soon found that we had made acquaintance, and improved it, for several years, on the walls of various exhibition galleries. There is one old gentleman, with long white hair and an immense beard, who, to my knowledge, has gone half through the catalogue of the Royal Academy. This is the venerable or patriarchal model. He carries a long staff, and every knot and twist in that staff I have seen faithfully delineated innumerable times. There is another man, in a blue cloak, who always pretends to be asleep in the sun (when there is any), and who, I need not say, is always very wide awake, and very attentive to the disposition of his legs. This is the *dolce far' niente* model. There is another man, in a brown cloak, who leans against a wall, with his arms folded in his mantle, and looks out of the corners of his eyes, which are just visible beneath his broad slouched hat. This is the assassin model. There is another man, who constantly looks over his own shoulder, and is always going away, but never goes. This is the haughty, or scornful model. As to Domestic Happiness, and Holy Families, they should come very cheap, for there are lumps of them all up the steps; and the cream of the thing is, that they are all the falsest vagabonds in the world, especially made up for the purpose, and having no counterparts in Rome, or any other part of the habitable globe.'

We conclude with a bit of true Bozzism, showing that home is, after all, his proper field. Speaking of his excursions in and around Rome, he says he often encountered a company of English; one Mr Davis, and a small circle of friends. 'It was impossible not to know Mrs Davis's name, from her being always in great request among her party, and her party being everywhere. During the Holy Week, they were in every part of every scene of every ceremony. For a fortnight or three weeks before it, they were in every tomb, and every church, and every ruin, and every picture gallery; and I hardly ever observed Mrs Davis to be silent for a moment. Deep under ground, high up in St Peter's, out on the Campagna, and stifling in the Jews' quarter, Mrs Davis turned up all the same. I don't think she ever saw anything, or ever looked at anything; and she had always lost something out of a straw hand-basket, and was trying to find it, with all her might and main, among an immense quantity of English halfpence, which lay, like sands upon the sea-shore, at the bottom of it. There was a professional cicerone always attached to the party (which had been brought over from London, fifteen or twenty strong, by contract), and if he so much as looked at Mrs Davis, she invariably cut him short by saying, "There, God bless the man, don't worrit me! I don't understand a word you say, and shouldn't if you was to talk till you was black in the face!" Mr Davis always had a snuff-coloured greatcoat on, and carried a great green umbrella in his hand, and had a slow curiosity constantly devouring him, which prompted him to do extraordinary things—such as taking the covers off urns in tombs, and looking in at the ashes as if they were pickles—and tracing out inscriptions with the ferrule of his umbrella, and saying, with intense thoughtfulness, "Here's a B you see, and there's an R; and this is the way we goes on in; is it?" His antiquarian habits occasioned his being frequently in the rear of the rest; and one of the agonies of Mrs Davis, and the party in general, was an ever-present fear that Davis would be lost. This caused them to scream for him in the strangest places, and at the most improper seasons. And when he came, slowly emerging out of some sepulchre or other, like a peaceful Ghoule, saying, "Here I am!" Mrs Davis invariably replied, "You'll be buried alive in a foreign country, Davis, and it's no use trying to prevent you!"'

TRADE AND PUBLIC BUSINESS IN SCOTLAND TWO HUNDRED YEARS AGO.

The materials which we have hitherto derived from the Club-Books have belonged to the regions of poetry, romantic fiction, or personal adventure. On the present occasion we are led into a totally different track, by having our attention directed to a paper which affords us the means of estimating the progress made by Scotland in wealth and prosperity during a period of two centuries. In 1656, a report was prepared for the use of the government of Oliver Cromwell, of which the following succinct account is given by the gentleman who presented the work to the Bannatyne Club:—'Mr Tucker, the author, was sent by the government of England for the purpose of introducing order into the collection of the revenues of excise and customs, and appointed one of the commissioners of the Scotch board. He appears to have possessed very eminent qualifications for a task which, in the state of the country at that time, must have been attended with great difficulties; and he has communicated the result of his inquiries and personal observation with great clearness and ability in this report. It affords a comprehensive view of all the details connected with the collection of these taxes, and some account is given of every harbour and creek upon the coast to which vessels resorted at that time.'

It is very clear that one of the vital elements of a strong orderly government must be a full knowledge of the resources of the country—whether in the shape of land, commerce, industry, or accumulated capital. The financier who calculates the produce of any given tax must be well supplied with such information; and it is in those countries where taxes are levied rather as a badge of subjection than for the useful purposes of government, that such knowledge is neglected. Oliver Cromwell, and the able men by whom he was surrounded, had a keen eye towards everything that was thoroughly useful to the government, and through the government to the community. His services towards the purely utilitarian purpose of preserving fixed records of the resources of the country, may not seem very great in the eye of hero-worship; nay, an allusion to them may suggest a sneer about 'humdrum,' or 'dry-as-dust;' but, nevertheless, there are many who will be disposed to give more admiration to these efforts than to his incomprehensible speeches. One of his darling projects was the establishment of a general system throughout England for the registration of land. It was precisely such a system as he found at work in Scotland—a set of records in which all operations regarding land, whether relating to absolute conveyances

or to securities, should be engrossed. Ludlow tells us how hard a battle he fought for this project, and how he was defeated by the lawyers, or, as he said, 'found the sons of Zeruiah too strong for him.' He made a general valuation of all the lands in Scotland, for the purpose of regulating the proportional allotment of the land tax. At the Restoration, it was, with most of the Protector's new projects, revoked; but it was found so convenient an arrangement, that the new government felt it expedient afterwards to have recourse to it, and it was called the 'valued rent'—being in fact the only valuation which has been made of the landed property in Scotland, and, as such, still employed for purposes of taxation.

Mr Tucker's report exhibits to us one of these projects for making the government acquainted with the resources of the country. We possess so few materials for ascertaining the pecuniary means, the trade, and the industrial habits of our ancestors, that any such collection is a valuable medium of comparing our own state with theirs. In the seventeenth century, and indeed down to a late period, the customs collected were not only on goods imported, but on those exported; because it was supposed to be a crime to provide our neighbours abroad with the valuable commodities which our artificers made and our husbandmen raised. Some of Mr Tucker's chief difficulties are in the devising means for enforcing the customs outwards—men being so naturally perverse, that when they created a commodity for which a foreigner would pay them better than a native, they thought themselves entitled to sell it without paying a tax for the privilege of doing so. We shall give some examples of the customs' receipts reported by Mr Tucker, and compare them with late results. The accounts are stated in periods of four months. Taking three of these for the year ending in September, we find that the annual income of the custom-house at Leith was L.2335. The corresponding sum for 1844 was L.631,926. The amount raised in Dundee in 1646 was L.501; in 1844, it was L.42,737. Those who have noticed the relative shipping of the two towns, Leith and Dundee, may be astonished that there should at this day be such a difference in their customs' returns in favour of the former; but it must be remembered that the imports to Leith are chiefly for the consumption of an affluent district, and thus consist of highly-taxed articles—such as wine, spirits, groceries, &c.; while those of Dundee are mainly for manufacturing use, and so consist of raw materials, paying duties comparatively small. To return to Mr Tucker. His statement of the customs collected at Aberdeen shows an amount of L.573; in 1844, the corresponding amount was L.76,259. Among the remarkable things, however, in this report, is the approach that seems to have been made by places now wholly insignificant to rivalry with the principal seaports. Thus at Borrowstonness, or, as it is contracted, Bo'ness, Tucker reports a collection of L.1569; in 1843, the sum collected was L.8961; a great improvement on the immediately preceding year, when it was only L.3327. Burntisland, which is now merely a ferry harbour, collected a custom of L.413. With these we may contrast Glasgow, which, in 1656, produced L.554; in 1844, L.551,841. The small old boroughs, which the steamboat traveller sees studded on the fringe of the coast of Fife, were in Mr Tucker's time considerable places, and he is at pains to enumerate their shipping. Thus we find that Anstruther had ten vessels; exactly the same number as Dundee. Wemyss, now a village with four or five hundred inhabitants, had six vessels; and its neighbour, Pittenweem, two. Burntisland had seven vessels; Dysart four; and Kirkcaldy, still a flourishing place, though not proportionally so eminent as it was, had twelve. Glasgow had precisely the same number. The tonnage seems to have been distributed between these places with tolerable equality. The highest in Glasgow was one hundred and fifty, while the highest in Kirkcaldy was one hundred; but then the lowest in Glasgow was twelve, while the lowest in Kirkcaldy was thirty. It is almost unnecessary to state that the twelve ships of Glasgow have now increased to between three and four hundred, and that its tonnage of 1660 has increased to 58,478.

Mr Tucker gives us some curious pictures of the state of the times. The method of collecting the revenue of excise was by farming it out; that is, by letting it to the highest bidder, as turnpike tolls are let, and allowing the tenant to make what he might of his bargain. A salaried collector generally gets a per centage on the sum realised by him. It is at once pretty clear, that when a man gets the whole sum he collects, instead of such a proportion, he will be much more zealous in enforcing the law, and will endeavour to recover sums which the hired fiscal officer would give up as bad debts. Hence farmers of the revenue have been in all ages proverbial as oppressors. When the members of a convivial party were telling their stories of murders and robberies, Voltaire, who was called on to contribute his tale, said, 'There was once a farmer-general—you know the rest.' Tucker tells us precisely what we would expect, that there was great competition among the local lairds and corporate bodies to obtain the lease of the excise, on account of the power and consequence so bestowed on them. He says, 'The strong and fervent desires which partly the violence of some of the farmers, and partly an innate propensity and inclination of being despotical, had kindled in many to farm their own counties and burghs, increased the number of the proposers, and put an opportunity into the hands of the commissioners not only to make some improvement, but, after some time spent in treaty (in which they had much of trouble to wrestle with), to let the whole at the rates and rents mentioned in the account thereof hereafter following, much to the content and satisfaction of the shires and burghs generally, the shires of Mid-Lothian, Argyle, and Bute excepted, which remain to this day undisposed of by way of farm; the former because of its vicinity to the town of Edinburgh, and their tack; and the latter in respect of the country itself, being wholly highlands, into which the commissioners did take care to send one of their own countrymen, who returned as he went, without doing anything; and after that, had some intentions of commissioning some officer of the nighest garrison. But there being some hopes given by the marquis that there should be somebody sent from the country who should do the business, they took hold of the opportunity of one related to the Campbells of that country, who at that time offered himself, and was convinced might be the person hinted, and therefore waived their former resolution, and gave him their commission; who, with the assistance of his friends, did collect some L.30; but was afterwards, at his being in Isla, and when he was in the execution of his trust, stabbed in the shoulder by one of his countrymen, who fled thereupon into Ireland, and hath for some time lain under the cure of chirurgeons, and at my coming away continued so, languishing without any hope of recovery.'

A vain effort had been made to separate the mere right of demanding and collecting the money from that of enforcing payment by process of law. It was thought that it would be more just and conciliatory to give the latter functions to some fixed judicial body. It was in the end necessary to 'let the farmers loose,' as Mr Tucker vividly expresses it, on the people. 'As the commissioners could very much have wished, they might have found so plentiful a choice of farmers, as that it might have been within their power to have made election of the best qualified, related, and substantiallest of them; but an inevitable necessity casting them upon some determinate persons, they had nothing more to do than to consider of the best way of proceeding according to the juncture of things; and therefore duly weighing as well the quality of the farmer, as having a regard to the temper and humour of the people, and finding part of the farmers to be English, and not ac-

quainted either with the thing, persons, or places, and the rest Scots, and in this respect more qualified and less obnoxious, but naturally rigid exactors, apt to avenge private quarrels or discontents under colour or pretext of public employment, and most of them generally strangers to the particular work in which they engaged. And considering withal the people on the other side, through poverty and an innate habit of their own, to be cross, obstinate, clamorous, and prone to apprehend every action an oppression or injury, and again to repel both either with noise or force. For prevention, therefore, of any provocations that might happen to be given, either by the indiscretion or violence of the farmers, and to leave the people masters of their own peace and quiet, the commissioners did resolve to reserve the judicial part in themselves, and to give the farmer only the collective power; which was done accordingly.

'Of this, observation was soon made by some of the most intelligent sort of people, and by them infused into the rest, which made a general deficiency in every one. Very few, or none, would pay any money, suffer any distress, or obey any summons; insomuch that the commissioners were enforced to retract their former resolution, and to let the farmer loose to the full execution of all the powers and authorities of the several acts and ordinances, but against and upon such only as should refuse to give due obedience; that so they might have a just sense that the commissioners did still retain, and should have continued, their first tenderness towards them, had they not been enforced to depart from it, not out of any levity or inclination in themselves to vex or disquiet the people, but from the just necessity they had of compelling them to submit to, and comply with, the laws of excise.

'The cause of the people's obstinacy and the commissioners' lenity being at once taken away, every one, acted by his fear and the expectation he had of suffering the penalties of the law, began to provide for his own peace and security, by a timely conformity, and so made way for the more easy and vigorous carrying on of things in the future.'

Nothing is known of Mr Tucker's private history. He was apparently an able and judicious man, and his composition is lively and expressive. As a specimen of his similies—he speaks of 'how much an act of inadvisedness it must needs be esteemed in any that should adventure to frame a vest or garment for a body, whose measure had never yet been taken, without viewing it in its parts and dimensions.' May we infer from this that Mr Tucker was brought up to the honourable profession of making garments?

We shall conclude with a curious and very distinct notice of the state of the salt manufactories in Scotland, the social condition of the persons employed, and the method in which their business was conducted.

'The proprietors or possessors of the pans are usually called masters, and the workmen, who actually labour in and about these pans, are termed makers, who receive no certain salary or wages from those masters of theirs, but do contract, upon receiving such a quantity of coal, to make and return the master such a quantity of salt as be agreed upon betwixt them; the overplus (whatever it is) that is made remaining to them for their pains, which they usually sell to cadgers, and other poor people, who carry the same about in creels, on horseback, or otherwise, up and down the country, for the expense and consumption thereof. The other, which is the master's, is laid up in his girnels or stores, and for the most part sent out afterwards in great parcels either for England, or some foreign parts beyond the seas. This being the manner and practice of the salt-works in these parts, and the collectors, for the better keeping and framing an account, calling upon those masters to make weekly entry of what salt was made at their pans, they refuse the doing thereof; dispute the letter of the act; conceding the chief scruple, and granting that indeed the makers were liable, but that they, being no such, and their workmen being the makers, they, and only they, were the persons liable to make entries, and be accountable for what was made; and pray therefore that they may be proceeded against according to the law: with this distinction, they challenge a freedom to themselves from being liable; and that, if yet they must remain responsible, that they ought to be so for no more than come into their girnels, as not knowing what else or more was made at any time at their pans. And to require an account, or anything else of the workmen—who, besides their infinite poverty and miserableness, are (were it not a breach of charity) to be esteemed rather brutes than rationals—was a thing altogether impossible, nor ever can be reputed so much as probable by any who have ever seen either the persons or the places; and as it was not to be effected in any manner of way whatsoever, without the appointing of some person night and day to attend every particular pan when it was boiling, by which the charge would certainly have been greater than the receipt, so the officers could not meet with, or discover half the salt that was sold, in respect the same was sold, delivered, and carried away always in the night, insomuch as none, or seldom any notice could at any time be had or taken of the same; or if there were, not without the danger or hazard of some mischief to ensue thereupon.'

THE BEAR-CHASE.

A SOUVENIR OF AN OLD HUNTER.

[From the French.]

One evening, a short time after the battle of Fontenoy (1745), a group of the king's body-guard was congregated near the Latona basin, at Versailles, listening to two of their number discussing a subject which at that period was rarely a matter of controversy in military circles.

'Refuse a duel after a public affront!' exclaimed the tallest of the speakers, whose bronzed features were rendered almost ferocious by a thick red mustache: 'it is a stain that all the waters of the deluge would not wash away.'

'I repeat, Monsieur de Malatour,' replied the other in a calm, polite tone, 'that there is more true courage in refusing than in accepting a duel. What is more common than to yield to passion, envy, or vengeance; and what more rare than to resist them? Therefore it is a virtue when exhibited at the price of public opinion; for what costs nothing, is esteemed as worth nothing.'

'A marvel! Monsieur d'Argentré, I would advise, if ever the king gives you the command of a company, to have engraven on the sabres of the soldiers the commandment—"*Thou shalt do no murder.*"'

'And wherefore not? His majesty would have better servants, and the country fewer plunderers, if we had in our regiments more soldiers and fewer bullies. Take, as an example, him with whom you seem so much incensed: has he not nobly avenged what you call an affront by taking, with his own hands, an enemy's colours, while your knaves most likely formed a prudent reserve behind the baggage?'

'Cowards themselves have their moments of courage.'

'And the brave also their moments of fear.'

'The expression is not that of a gentleman.'

'It is that of Monsieur de Turenne, whose family equalled either of ours, and who avowed that he was not exempt from such moments. Everybody has heard of his conduct to a braggadocio, who boasted in his presence that he had never known fear. He suddenly passed a lighted candle under the speaker's nose, who instantly drew back his head, to the great amusement of the bystanders, who laughed heartily at this singular mode of testing the other's assertion.'

'None but a marshal of France had dared to try such a pleasantry. To our subject, sir. I maintain that your friend is a coward, and you——'

'And I——' repeated D'Argentré, his eyes flashing, and his lips firmly compressed.

'Holla, gentlemen!' exclaimed a third party, who, owing to the warmth of the argument, had joined the group unperceived. 'This is my affair,' said he to Monsieur d'Argentré, holding his arm; then turning to his adversary, added—'Monsieur de Malatour, I am at your orders.'

'In that case, after you, if necessary,' said D'Argentré, with his usual calmness.

'By my honour you charm me, gentlemen! Let us go.'

'One moment,' replied the new comer, who, young as he was, wore the cross of St Louis.

'No remarks. Gentlemen, hasten.'

'Too great haste in such cases evidences less a contempt for death than an anxiety to get rid of his phantom.'

'I listen, sir!'

'Monsieur d'Argentré just now stated that the bravest have their moments of fear. Without taking as serious his anecdote of Monsieur de Turenne, I shall add that, with the exception of the difference that exists between muscles and nerves, the courage of the duellist is more an affair of habit than of principle; for it is the natural state of man to love peace, if not for the sake of others, at least for himself. Do you wish me to prove it?'

'Enough, sir: we are not here to listen to a sermon.'

'Yet a moment. Here is my proposition: we are all assembled this evening previous to our leave of absence: I invite you, then, as also these gentlemen present, to a bear-hunt on my estate, or rather amongst the precipices of Clat, in the Eastern Pyrenees. You are very expert, Monsieur de Malatour—you can snuff a candle with a pistol at twenty paces, and you have no equal at the small-sword. Well, I shall place you before a bear, and if you succeed—I do not even say in lodging a ball in his head, but merely in firing upon him—I shall submit immediately after to meet you face to face with any weapons you choose to name, since it is only at that price I am to gain your good opinion.'

'Are you playing a comedy, sir?'

'Quite the contrary. And I even repeat that this extreme haste shows more the courage of the nerves, than of the true courage arising from principle.'

'What guarantee have I, should I accept your proposition, that you will not again endeavour to evade me?'

'My word, sir; which I take all my comrades to witness, and place under the safeguard of their honour.'

There ran through his auditory such a buzz of approbation, that De Malatour, though with a bad grace, was obliged to accede to the arrangement. It was then agreed that, on the 1st of September, all present should assemble at the Chateau du Clat.

Whilst the young lord of the manor is making the necessary preparations for their reception, we shall explain the accusation of which he was the object, yet which had not branded him with any mark of disgrace among a class of men so punctilious on the point of honour.

The young Baron de Villetreton, in entering amongst the gentlemen who formed the household guard of the king of France, carried with him principles which remained uncorrupted amidst all the frivolities of one of the most licentious courts in Europe. Such, however, is the charm of virtue, even in the midst of vice, that his exemplary conduct had not only gained him the esteem of his officers, and the friendship of his companions, but had attracted the attention of the king himself. One alone among his comrades, Monsieur de Malatour, took umbrage at this general favour, and, on the occasion of some trifling expression or gesture, publicly insulted him. Villetreton refused to challenge him, as being contrary to his principles, but determined that this seeming cowardice, in not fighting a well-known duellist, should be redeemed by some action of *eclat* during the campaign just commenced. That moment had arrived; and for his noble conduct in taking the English colours at the battle of Fontenoy, he received the cross of St Louis from the king's own hand on the field, the eulogium of Marshal Saxé, and a redoubled enmity on the part of De Malatour.

The first care of the young baron on arriving at his estate was to call his major-domo, an old and faithful servant.

'I have business of thee, my master,' said he, cordially shaking him by the hand.

'Speak, monseigneur,' replied the pareur, who was deeply attached to his young lord: 'you know the old hunter is yours to his last drop of blood.'

'I never doubted it, my old friend. Did you receive my letter from Paris?'

'Yes, sir; and those gentlemen, your comrades, will have some work before them.'

'Are there bears already on the heights then?' asked Villetreton, extending his hand in the direction of one of the lofty peaks, whose summit, covered with snow, glittered in the morning sun.

'Five in all—a complete *ménage*—father, mother, and children; besides an old bachelor, whom the Spaniards have driven to this side.'

'In less than a week we shall go in pursuit of them. Do you know, pareur, some of my comrades are rather rough sportsmen: there is one of them who is able to snuff a candle with a pistol at twenty paces.'

'Easier, perhaps, than to snuff a bear at four,' replied the old man laughing.

'That is what I said also. But as I should wish to judge for myself of his prowess, you must place us together at the same post—at the bridge of Maure, for instance.'

'Hum!' said the pareur, scratching his ear; 'it would better please me to have you elsewhere.'

'Why?'

'Because, to guard this post, a man ought to be in a state of grace, for he will be between two deaths—the bears and the precipice.'

'I know the one, and do not fear the other; thanks to your lessons.'

'I am sure of that. But, with your leave, I should like to guard the bridge myself.'

'You are sure, then, that the bears will pass that way?'

'Sure—yes; but quite sure—no. Recollect that they are sullen and prudent beasts, which never confide their plan of route to any one.'

'It is agreed on. I shall guard the bridge with my comrade. Now, go and have the trackers ready.'

'Very well, very well,' murmured the pareur as he retired; 'I shall have my eye on him.'

Eight days afterwards, all those invited, not excepting Monsieur de Malatour—who, despite the delicate attentions of the host, preserved a cold reserve—were assembled at the chateau. The magnificent grandeur of the Pyrenees, their shining summits relieved against the blue sky of Spain, was an unlooked-for pleasure to the greater number of the guests, who for the most part belonged to the rich and fertile plains of the interior.

The morning following their arrival, a body of trackers and scouts, provided with all manner of discordant instruments—trumpets, saucepans, drums, &c. &c.—were assembled under the walls of the chateau, with the pareur at their head; while by his side stood the mandrin, who proudly guarded a dozen large mastiffs, held in leash by his vigorous helpers. The young baron and his friends, armed with carabines and hunting-knives, had scarcely appeared, when, by a sign from the pareur, the whole troop moved silently forward. The dogs themselves seemed to understand the importance of this movement; and nothing was heard but the confused tramp of feet, blending with the noise of the distant torrent, or, at intervals, the cry of some belated night-bird flying heavily homeward in the doubtful glimmer of the yet unopened day.

As the party reached the crest of the mountain which immediately overhung the chateau, the first rays of the sun breaking from the east glanced on the summit of the Pyrenees, and suddenly illuminating the landscape, discovered beneath them a deep valley, covered with majestic pine-trees, which murmured in the fresh breeze of the morning.

Opposite to them, the foaming waters of a cascade fell for some hundreds of feet through a cleft which divided the mountain from the summit to the base. By one of those caprices of nature which testify the primitive convulsions of our globe, the chasm was surmounted by a natural bridge—the piles of granite at each side being joined by one immense flat rock, almost seeming to verify the fable of the Titans; for it appeared impossible that these enormous blocks of stone could have ever been raised to such an elevation by human agency. Sinister legends were attached to the place; and the mountaineers recounted with terror that no hunter, with the exception of the pareur, had ever been posted at the bridge of Maure without becoming the prey of either the bears or the precipice. But the pareur was too good a Christian to partake of this ridiculous prejudice: he attributed the fatality to its real cause—the dizziness arising from the sight of the bears and the precipice combined, by destroying the hunter's presence of mind, made his aim unsteady, and his death the inevitable consequence. He could not, however, altogether divest himself of fears for his young master, who obstinately persevered in his intention of occupying the bridge with his antagonist.

After placing the baron's companions at posts which he considered the most advantageous, the pareur rejoined his men, and disposing them so as to encompass the valley facing the cascade, commanded the utmost silence to be preserved until they should hear the first bark of his dog. At that signal the mastiffs were to be unleashed, the instruments sounded, and all to move slowly forward, contracting the circle as they approached the cascade. These arrangements being made, the pareur and his dog, followed by the mandrin alone, disappeared in the depths of the wood.

For some minutes the silence had remained unbroken, when suddenly a furious barking commenced, accompanied by low growling. Each prepared his arms; the instruments sounded; and the mastiffs being let loose, precipitated themselves pell-mell in the direction of the struggle. Their furious barking was soon confounded with the cries of the hunters and the din of the instruments, mingled with the formidable growling of the bears, making altogether a hideous concert, which, rolling along the sides of the valley, was repeated by the distant echoes. At this moment the young baron regarded his companion, whose countenance, though pale, remained calm and scornful.

'Attention, sir,' said he in a low voice. 'The bears are not far from us: let your aim be true, or else——'

'Keep your counsels for yourself, sir!'

'Attention!' repeated Villetreton, without seeming to notice the surly response—'he approaches!'

Those who were placed in front of the cascade, seeing the animals directing their course to the bridge, cried from all parts, 'Look out, look out, Villetreton!' But the breaking of branches, followed by the rolling of loosened stones down the precipice, had already given warning of the animal's near approach. Malatour became deadly pale; he, however, held his carabine firmly, in the attitude of a resolute hunter.

A bear at length appeared, with foaming mouth and glaring eyes, at times turning as if he would fain struggle with his pursuers; but when he saw the bridge, his only way of escape, occupied, he uttered a fearful growl, and raising himself on his hind legs, was rushing on our two hunters, when a ball struck him in the forehead, and he fell dead at their feet.

Malatour convulsively grasped his gun—he had become completely powerless. Suddenly new cries, louder and more pressing, were heard.

'Fire! fire! he is on you!' cried the pareur, who appeared unexpectedly, pale and agitated, his gun to his shoulder, but afraid to fire, lest he should hit his master.

The latter, perceiving his agitation, turned round: it was indeed time. On the other side of the bridge, a bear, much larger than the first, was in the act of making the final rush. Springing backward, he seized the carabine of his petrified companion, and lodged its contents in the animal's breast ere he could reach them. He rolled, in the death-struggle, to where they stood. All this was the work of an instant. The knees of the hardy old pareur shook with emotion at the escape of his young master; as for Malatour, his livid paleness, and the convulsive shuddering of his limbs, testified the state of his mind.

'Take your arms,' said the young baron, quickly replacing in his hands the carabine; 'here are our comrades—they must not see you unarmed; and, pareur, not a word of all this.'

'Look!' said he to his companions as they gathered around, pointing to the monstrous beasts—'one to each. Now, Monsieur de Malatour, I wait your orders, and am ready to give the satisfaction you require.'

The latter made no reply, but reached out his hand, which Villetreton cordially shook.

That evening a banquet was given to celebrate the double victory. Towards the end of the repast a toast to 'the vanquishers' was proposed, and immediately accepted. Monsieur d'Argentré, glass in hand, rose to pledge it, when Malatour, also rising, held his arm, exclaiming—'To the sole vanquisher of the day!—to our noble host! It was he alone who killed the two bears; and if, through his generosity, I have allowed the illusion to last so long, it was simply for this reason: the affront which I gave him was a public one—the reparation ought to be public likewise. I now declare that Monsieur de Villetreton is the bravest of the brave, and that I shall maintain it towards all and against all.'

'This time, at least, I shall not take up your gauntlet,' said Monsieur d'Argentré.

'There's a brave young man!' cried the pareur, whom his master had admitted to his table, and who endeavoured to conceal a furtive tear. 'Nothing could better prove to me, sir, that, with a little experience, you will be as calm in the presence of bears, as you are, I am sure, in the face of an enemy.'

GOSSIP FROM LONDON.

May 1846.

London is now at its busiest. Exeter Hall is scarcely ever cool, so rapidly does one public-meeting follow another; and at various dinner parties, wherever you go, there are lots of country friends, all come up on errands of business, charity, or curiosity. I do not, however, see many novelties in the way of shows. One of the prettiest of the season is a panorama of Constantinople, a visit to which realises, to a wonderful degree, that great and interesting city. Those interested in the colony of New Zealand have an opportunity of seeing much to please them at the Egyptian Hall, where, besides a large number of excellent views, taken by an artist on the spot, there are a few live chiefs in appropriate costume. These, and other sights of the ordinary class, yield in attractiveness to that marvel of art, 'London by moonlight,' at the Colosseum, in the Regent's Park. The panorama of 'London by day' continues to be shown in the same establishment; the view at night being extended, as I understand, in front of it. The charm of the night scene consists in the skyey and atmospheric effects. The moon is an exceedingly well-got-up moon, only a *leetle* too green in tinge; and the stars twinkle just as real stars are in the habit

of doing. The illusion is helped by the vibratory sparkling of the moonbeams in the Thames, with occasional flashes of lightning, the roar of thunder, and an imaginary shower, that almost makes you feel for your umbrella. What a pelting rain they seem to be getting down there in St Paul's churchyard! The shower having passed, the sky brightens up, and thin fleecy clouds, slowly sweeping across the moon, seem to dissolve into air, and are lost. This part of the illusion is, on the whole, done with good effect, by means, as I imagine, of a magic lantern. The pleasure of the spectacle would doubtless be much enhanced if the people who go to look at it would hold their peace, or speak only in a whisper; instead of which, you hear a dozen voices roaring out, 'Yes, there is my shop, and the very lamp in the window!' 'I cannot make out where I am.' 'Don't you see that is Christ's Hospital, and that the Thames over there?' 'Oh la! how beautiful—how very like!' 'Well, I never!'—and so on. A hint from the manager to keep silence would be well directed; but as it might be considered unconstitutional, John and Mrs Bull would probably lodge a protest, and speak louder than ever, 'if only to vex 'em.'

There has been nothing very remarkable doing amongst the booksellers this spring. One is tempted to suspect that there is now a dearth of great men in all departments. England, like an ill-kept shop, seems to be at present out of first-class goods. It has no great statesmen, great authors, great actors, great philosophers, or great anybody—except in their own estimation. Out of the universal dulness the fine arts seem to be struggling. There is a marked improvement in pictorial art. The exhibition of the Royal Academy, opened in May, is unquestionably among the best which has yet taken place. There are fewer indifferent pieces, and more of a superior order, than I have observed at any previous exhibition. The pictures considered most successful are those of Mulready, Landseer, Roberts, Stanfield, and Cooper. There are some capital portraits, among which are a few good ones by Scottish artists, Mr Watson Gordon still bearing the palm. In sculpture, I would particularise a statue of Eve by Marshall, and the statue of the late David Hare of Calcutta, a person who distinguished himself as an advocate for education in India.

Talking of the fine arts, I hear that Scotland is shortly to be illustrated by a series of engravings, as numerous and splendid as those in Roberts's magnificent work on Egypt and Palestine—the whole to be accompanied with descriptive letterpress. For this gigantic enterprise—undertaken unitedly by an Edinburgh and London publishing house—Mr Roberts, among other artists, is secured. He has stipulated, I am told, to execute all the fine old abbeys and cathedrals, forty in number, from the Borders to Kirkwall; and, I believe, may be expected in the north with his sketch-book some time in the approaching summer or autumn. I augur the better for this scheme, in as far as I happen to know that it is accordant with an old and cordially-cherished wish on the part of Roberts.

Still talking of art—what a great improvement has latterly taken place in London street-architecture. No houses are now reared in that bald, commonplace style so common in the reign of George III. A taste has sprung up for the rich Italian or Elizabethan models, with good cornices and balconies. Some fair specimens of this *renaissance* are observable at the new openings into Leicester Square, and in the junction between Oxford Street and Holborn. I do not, however, besides these, see any other works in progress for the improvement of the denser parts of the metropolis. Every one acknowledges that the Metropolitan Improvement Commission is a very sorry affair; just as somnolent as any corporation needs to be. One could almost wish for a year or two of a smart despotism, to make things affecting the general welfare jog on a little faster!

I observe that the wooden pavement, of which so much was said a few years ago, will not answer. In some places it is worn into great hollows, and at others is in the course of removal, stone resuming its place. The great objection to this species of pavement, is its slipperiness for the horses in wet weather. Wearing smooth by friction, and getting filled up in the seams, it presents a smooth polished surface, on which the poor animals may be said to skate rather than run, every foot sliding in advance of the part on which it happens to fall. To obviate this serious defect, the wooden pavement of Regent Street has been lately covered with small broken stones, and is now a kind of macadamised floor. This may answer to a certain extent; but it must be considered a virtual abandonment of wooden pavement. Stone, stone! nothing but the hardest stone will do for the paving of this trafficful city! everything else being soon ground to batter. The plan adopted for laying down stone where wood is taken up seems excellent. The stones are narrow—not more than three inches across the face, and of perhaps a foot in length. They are set like bricks on edge, the thin face uppermost; and are well bedded and united on a solid level basis with finely-slaked lime. The causeway so formed resembles a wall lying on its back, and presents a firm and equal resistance. As the stones are small, the noise and jolting are less felt than on the old broad courses. I believe, after all, that the mode of causeweying with small stones in the manner described will finally prove to be in all respects the best.

The prodigious throng of omnibuses through the streets seems to me ever on the increase, and every year the limits of the sixpenny rides are extending. In one direction you may now travel seven or eight miles for sixpence. At the same time, the thoroughfare of passengers by the steamboats on the Thames is also increasing and cheapening to a wonderful degree. The other day I went from Hungerford market to London Bridge for a penny! Such is now the veritable fare charged at least by some of the boats. There are eleven, I am told, flying up and down the Thames at this rate between Westminster and London bridges. Judging from the crowd in which I formed a unit, these penny fares will turn out not a bad speculation. The eleven vessels are said to make thirty-two trips per hour, or three hundred and twenty trips in the day, which, taking forty as the average number of passengers each journey, will make a total of 12,800 daily, or L.53. The sixpenny boats, of which several passed us, seemed to be scarcely affected by the opposition; such is the immensity of the human stir in London.

The very extraordinary desire lately manifested for all sorts of ancient ornament has given rise to various inventions; supply in this, as in everything else, following close on demand. I shall refer only to articles of the carved-wood species. By the first invention to be noticed, leather is substituted for wood. The leather, being reduced in a steam trough to a tenacious pulpy substance, is forced, by a combination of hydraulic and pneumatic pressure, into a metal mould, hollowed out according to the required design. When removed from the mould, and dried, the leather, now in shape, possesses a fine brown hue, resembling ancient carved walnut wood, and is as sharp in outline as if fresh from the knife of the carver. The objects produced by this curious process are very beautiful, and are of many varieties. Book-covers, card-cases, mouldings for libraries, ornaments for the roofs of apartments, and picture and mirror frames, are among the articles for which the invention is adapted. The whole of the decorations of a cabinet, nine feet by seven, lately constructed for her Majesty, were of this kind of stamped leather. When a mould of any design is cut, any number of impressions can of course be taken at a comparatively small cost.

The invention which may be next adverted to, consists in stamping wood with a hot metal mould, and so burning it into the required form. The heat is not so great as to char or destroy the wood during the process. When the mould is withdrawn, it leaves a dark, half-

burnt surface, which being scraped off, a fine brown antique tinge is found to remain. There is, however, a certain want of sharpness in the outlines, which must be given by a carving tool with hand labour. Any kind of old carving can be very nicely and cheaply imitated by this plan. For backs of chairs, lids of boxes, door panels, wooden mouldings of all kinds, and so on, it is admirable. Suppose you see a fine old carved door, of which you would like to have a copy, you take a cast of it in plaster of Paris. From this you get a mould of iron in relief; then from this you get a mould in iron sunk; that is, a durable and workable duplicate of the plaster cast. With this heated to the proper temperature, and applied by machinery, the wood is stamped. A door exactly resembling the original is the result. Such will afford a rough idea of this ingenious process, which is particularly suited for imitating old carvings of a certain class. Any carving from an original or from a copy can be produced, I believe, at a third or fourth, and in some cases a sixth, of what it would cost by hand labour. The process is the subject of a patent.

The method of producing beautiful carvings by burning, is unfortunately defective in one particular, and this, I fear, must limit its general adoption. A stamp cannot go round corners, or behind the parts intended to be in bold relief; it can sink only straight down. For example, we may stamp a face, but not a whole head, unless, indeed, we employ a stamp for both front and back. Hand-carving partly repairs this defect; but that is expensive, besides being otherwise objectionable. For all very complex carvings, therefore, and all carvings of objects back and front, round and round, we must have recourse to a different process, and this brings us to the third invention.

Carving by machinery is not altogether new, but it was reserved for Mr Jordan to realise a scheme, the most perfect which can be conceived, for producing several copies at once of any imaginable piece of carving. In this, however, as in the two previously-mentioned processes, a model must in the first place be formed; and therefore, when only *one* of any piece of carving is wanted, it is the best way still to execute it with the hand. A model, however, for machine carving, may be made in wax, then transferred to plaster of Paris, whence a model in type metal may be procured. With this model, or with a previous carving, which is to be copied, the operator commences. The model is fixed, with its face uppermost, in the middle of a table, which, by means of a double action beneath, may be guided in any direction on a horizontal plane; the action being properly two combined movements at right angles with each other. At the distance of a few inches, on each side of the model, are fixed the two pieces of wood which are to be carved. Over the table is a beam, holding three tools, with the points downwards. These tools are in a line, and of precisely the same length. The central tool, called the tracer, does not cut; it terminates in a small round knob: the two side tools are sharp, like gouges, and are turned rapidly by bands from the moving power. The whole trick of the carving now consists on moving the table below these instruments, so as to bring the model in contact with the tracer. In doing this, the two rough pieces of wood are at the same moment brought under the cutting tools, which whirl about at a great rate. A treadle, moved by the foot, raises or depresses the beam. In this manner, as the knob of the tracer rises or falls, gently pressing on the inequalities of the model, so do the cutters rise and fall, gouging out the hollows, and leaving the higher parts standing. As the operator, by keeping his eye fixed on the tracer, causes it to feel its way, so to speak, over the whole surface of the model, two exact counterparts, by the corresponding movements of the cutters over the wood, are necessarily produced. This is but a very imperfect sketch of the process, but it may serve for general information. For the sake of simplicity, I have spoken of a table and beam, whereas the whole is an apparatus of iron, with screws, shifts, and all other requisite appliances. To each machine there is one operator, and so simple are his duties, that an ordinary carpenter will become a proficient in a few days. It was with no ordinary degree of pleasure that I visited the establishment of Messrs Taylor, Williams, and Jordan, Belvidere Road, Lambeth, where a number of these carving machines were busy at work, the whole moved by a powerful steam-engine. Mr Jordan kindly explained the various parts of the process; and showed how, by changing the position of the wood, the tools would reach behind the exterior, or be made to cut on all sides, thus executing objects which no direct stamping could perform. He likewise mentioned that the process was as well adapted for sculpturing marble as for carving wood; and that he expected to place on his machine blocks of stone several tons in weight. When this is done, copies of the finest statues in marble will be obtainable at a price far below what they would now cost. I was shown various products of the machine in wood, possessing great beauty of design and finish, the minuter parts being aided by hand labour: among other specimens, I observed oak panels, with different devices, preparing for the new Houses of Parliament. Wood may be carved by this apparatus at about half the charge for hand labour. Carving effected by burning is, therefore, much the cheaper and more accessible of the two. I have no doubt, however, that there is plenty of room for all the plans which have been devised.

To change the subject. I attended a soirée a few evenings ago at the British and Foreign Institute, where about a hundred ladies and gentlemen were assembled for conversation and music. The rooms were splendidly lighted up, the whole forming a gay scene. We had some good music, vocal and instrumental, chiefly by foreigners lately come to London—this being a place where many of them make their début. I was particularly charmed with the performance of a M. Lavigne. In the hands of this person, and provided with a great number of keys, the hautboy seems to become a new instrument. In its old state, it had a sharp buzzing sound—a want of softness and volume, which caused it to be generally laid aside: it disappeared before the German flute and clarionet. From the beauty of the notes brought out by M. Lavigne, I should anticipate the revival of the instrument amongst us.

Dr Reid's process of ventilating the new Houses of Parliament has lately been the subject of no little controversy. Clever, but not particularly good-natured attacks on the doctor have appeared in the Quarterly Review and Times; and these, contrary to the usual love for fair-play in the English character, have inclined the public to set down his process as altogether visionary and impracticable. Taking some interest in the subject, I called the other day on the doctor, and found him as hearty as ever in the carrying out of his principles. He declares that there is scarcely a word of truth in the attacks made on his operations; but as the merits of the whole case are under official investigation, he declines to make any counter-statement in the newspapers. I may meanwhile remark the one predominant feature of all the attacks on Reid—a perfect oversight of the fact, that plans of ventilation are an effort to extinguish an existing evil, which affects the comfort and health of persons assembling in public, and even private buildings, to a vast extent. It seems purely the war of ignorance, childishly content with present unseen ills, against science, in her efforts—perhaps at first unavoidably defective, and at the best tentative—to substitute a better system. In looking over the parliamentary reports, I observe that Dr Ure, and other scientific men who were examined, all concurred in declaring that ventilation could be properly effected only by special structural arrangements; that to leave ventilation to come by doors and windows was absurd, for it was no proper function of these apertures to afford a supply of air. Parliament agreed in this reasonable proposition, and sought out Dr Reid to carry its wishes into execution; yet at every stage, as I understand, has he been interrupted

and thwarted. With everything to discourage, it must have required no ordinary degree of fortitude to face so vast an undertaking. The new Houses of Parliament, as is well known, are set down in a kind of pit. Perhaps the very worst situation in Westminster has been pitched upon. Originally a swamp gained from the river, the spot is environed by common sewers and springs, which endanger the foundations, and impregnate the air with miasma. Added to this source of atmospheric impurity, is the smoke poured from thousands of dwellings in the neighbourhood at a higher level; and how, in such circumstances, fresh air could be obtained by ordinary appliances, it would be somewhat difficult to discover.

I have seen a report in the newspapers, that a mine of diamonds has been discovered somewhere; but on making inquiries in London, it appears that these newly-discovered gems have not the proper brilliancy, and that therefore the better kind of diamonds are as expensive as ever. One of the finest suites of diamonds on sale in the metropolis has just been brought to the hammer, in the disposal of a jeweller's bankrupt stock. It consisted of a necklace, ear-rings, brooch, and bracelet, composed of four hundred carats of emeralds, and two hundred carats of diamonds; the bright green of the larger emeralds contrasting well with the lustrous white of the diamonds. It was altogether a splendid suite of ornaments; but the necklace, which was the principal article, had rather a heavy effect, being apparently calculated to set off a lady of large size. The lowest shop price asked for the whole had been L.8000. Curious to see who would buy these costly gems, I went, on the day of sale, to Christie's auction-room, King Street, St James's. There were not many people present; some Jew dealers forming the chief part of the audience. After a short bidding, the suite was knocked down to the Duke of Cleveland for L.3425. This was considered a great bargain for his Grace.

NOTES IN NATURAL HISTORY.

I. It is a well-known fact that none of the inferior animals can make a fire. Even the orang-outang, when he comes upon a fire left by man in the woods, though he may warm himself by the embers, never thinks of prolonging the blaze by adding fresh fuel: this is a step beyond the range of his capabilities. Man alone is a fire-using animal; and however simple it may appear, the lighting of a fire is an art, and an art that requires some skill too, as any one may ascertain who attempts it for the first time. Amongst the thousands of individuals in civilised society, how very few (except those regularly trained to it) could kindle a fire if left to their own resources! Yet how expertly will every savage perform this office. Mr C. Darwin thus describes the operation as performed by his two Tahitian guides, after they had taken up their night's lodgings on the ridge of a high mountain:—'By the aid of strips of bark for twine, the stems of bamboos for rafters, and the large leaf of the banana for a thatch, the Tahitians in a few minutes built an excellent house, and with the withered leaves made a soft bed. A light was procured by rubbing a blunt-pointed stick, of a peculiarly white and very light wood, in a groove made in another, until, by friction, the dust of the wood became ignited. This was the work of a few seconds; but to a person who does not understand the art, it requires the greatest exertion. Having made a small fire of sticks, they placed a score of stones, of about the size of cricket-balls, on the burning wood. In about ten minutes' time the sticks were consumed, and the stones hot. They had previously folded up, in small parcels of leaves, pieces of beef, fish, ripe and unripe bananas, and the tops of the wild arum. These green parcels were laid in a layer between two layers of the hot stones, and the whole then covered up with earth, so that no smoke or steam could escape. In about a quarter of an hour the whole was most deliciously cooked.'

The Guacho, or native of the Pampas, uses a different method in procuring a fire. Taking an elastic stick, about eighteen inches long, he presses one end on his breast, and the other, which is pointed, in a hole in a piece of wood, and then rapidly turns the curved part, like a carpenter's centre-bit, till the wood ignites. In the chill and humid climate of the Falkland Islands, the same observant traveller again remarks—'It was very surprising to see the Guachos, in the midst of rain, and everything soaking wet, with nothing more than a tinder-box and a piece of rag, immediately make a fire. They sought beneath the tufts of grass and bushes for a few dry twigs, and these they rubbed into fibres; then surrounding them with coarser twigs, something like a bird's nest, they put the rag, with its spark of fire, in the middle, and covered it up. The nest being then held up to the wind, by degrees it smoked more and more, and at last burst out into flames. I do not think any other method would have had a chance of succeeding with such damp materials.'

II. It is singular to think that our ancestors, the ancient Britons, lived in a state of almost complete nudity; and that in this state they enjoyed robust health in a climate that to us, their civilised descendants, demands many folds of warm clothing, besides comfortable houses and fires. Yet the natives of Patagonia, inhabiting a country still colder than Britain, go quite naked at the present time. They are described as a tall and robust race, though living in the lowest grade of savage simplicity. Such is the effect of habit in the animal system. Perhaps, on the whole, a low temperature is more conducive to both mental and bodily vigour than a high one, for, generally speaking, nations of the temperate and even frigid zones are found more energetic than those of the torrid. Yet it is only in so far as the severity of the climate enjoins industry and the arts, that these favourable results occur, for Mr Darwin's description of the natives of Wollaston island, Terra del Fuego, is by no means an engaging one. 'While going on shore,' says he, 'we pulled alongside a canoe with six Fuegians. These were the most abject and miserable creatures I anywhere beheld. On the east coast the natives have Guanaco cloaks, and on the west they possess seal-skins. Amongst these central tribes the men generally have an otter-skin, or some small scrap about as large as a pocket-handkerchief, which is barely sufficient to cover their backs as low down as their loins. It is laced across the breast by strings, and according as the wind blows, it is shifted from side to side. But these Fuegians in the canoe were quite naked; and even one full-grown woman was absolutely so. It was raining heavily, and the fresh water, together with the spray, trickled down her body. In another harbour not far distant, a woman, who was suckling a recently-born child, came one day alongside the vessel, and remained there whilst the sleet fell and thawed on her naked bosom, and on the skin of her naked child. These poor wretches were stunted in their growth, their hideous faces bedaubed with white paint, their skins filthy and greasy, their hair entangled, their voices discordant, their gestures violent, and without dignity. Viewing such men, one can hardly make one's-self believe they are fellow-creatures, and inhabitants of the same world.'

III. The inhabitants of mountainous countries remain much more fixed and rooted to their native soil than the inhabitants of plains. The Welsh and Highland Scotch have stuck to their mountains, and kept themselves apart from other races, for many centuries; while the inhabitants of the plains and more accessible parts of Britain have undergone interminable intermixtures. There is a people inhabiting the mountainous parts of the north-west of India, called the Sia-posh, that in physical appearance, manners, and language, preserve much of the character common to the original stock whence the great Indo-European nations sprung. Take one of these large-featured, fair, blue-eyed, and red-haired Indians, and place him beside a Scot or Welshman, and the physical resemblance will be very apparent. What appears even more strange, their languages will be found to have had the same derivation, and a great many words are still common to the three. Thus many names of familiar objects are nearly identical in the Sia-posh, the Welsh, and the ancient Erse; and so are the numerals from one to twenty. All these, too, bear a common relation to the same words in the Sanscrit—the original root from whence these different dialects are supposed to have originated. Strange attachment of the human affections, that the more rugged and wild the country, the more is the heart bound up in it—

> 'For the fierce whirlwind, and the torrent's roar,
> But bind them to their native mountains more.'

Yet it is a fitting arrangement, otherwise much of the earth's surface would be left untenanted. The inhabitants of the plains, again, have a migratory tendency; they move onward, and carry improvements in their train, and thus serve to spread population, and diffuse the arts of civilisation. With a wide extent of fertile prairies, and rich alluvial soil spread out before them, the go-a-head tendencies of the Americans are much more beneficial than more sedentary habits could be.

IV. It is a mistake to suppose that animals in a state of nature are exempt from diseases. All organic beings are liable to interruptions of their functions, and even derangements of their structure; though, on the whole, healthy action is the rule, and disease the exception. We find plants even extremely liable to all kinds of diseases, and so it must be with animals. They suffer from atmospheric changes, either affecting their bodies directly, or the substances on which they feed; they are annoyed, and often seriously afflicted, by parasites, which live on and within their bodies; and occasionally by derangements and malformations of organic structure in the mechanism of their own frames. Thus it has been well ascertained that epidemics occasionally produce great havoc among gregarious quadrupeds and birds. Dr Richardson mentions that on some occasions great mortalities take place among the beavers of North America. We know that grouse in this country not unfrequently die in great numbers during some unhealthy seasons; and Lewis and Clarke mention having shot, from among the herds of buffalo in the Rocky Mountains, individuals that were so diseased and emaciated as to be unfit for use. In our zoological gardens may frequently be seen the bilious and half-blind tiger, the paralytic fox, with twinkling half-shut eye and lifeless trembling limb, the phthisical monkey, and the skin-diseased drooping bird. All this, to be sure, is the effect of confinement, irregular and improper feeding, and impure air, and is so far an illustration of the melancholy effects of such practices as are self-imposed upon man in society; but it at the same time shows that even the inferior animals have all the same predispositions to disease, if the same baneful influences surround them, and if reason, or rather unreason, is allowed to interfere with their natural impulses and habits.

V. Birds, as regards structure, are perhaps the most perfectly endowed, as they are certainly the most beautiful and interesting, of the lower animals. In birds there is an admirable mechanism and adaptation both for gliding in the air and swimming in the water. They have a light but strong and compact skeleton, great and enduring muscular powers, a large nervous system, and most of the senses in a high degree of perfection. Their digestive and assimilatory powers are vigorous and perfect, and their respiratory organs are large: the consequence is, that their animal heat and vigour are superior to that of most other classes of animals. In general, the brain is large in proportion to the size of the body, and the instinctive powers are very perfect. A few kinds are rather dull and stupid, such as the gannets, noddies, &c.; but the parrot, magpie, raven, and many others, show great vivacity and quickness of intellect.

The bright and beautiful plumage of many kinds, the musical notes of others, the migratory motions of several classes, pointing out, and associated with, the successive changes of spring, autumn, and winter, all tend to invest with a high degree of interest those aërial creatures of the sky and waters. They form the ornaments of animated nature, as flowers and blossoms constitute the beauties of the vegetable kingdom.

The eggs of birds are variously tinted and mottled, and hence they become objects of interest to the collector. In this diversity of colour nature has doubtless some final end in view; and though not in every instance, yet in many, we can certainly see a design in the adaptation of the colours to the purpose of concealment, according to the habits of the various classes of birds. Thus, as a general rule, the eggs of birds which have their nests in dark holes, or which construct nests that almost completely exclude the light, are white; as is also the case with those birds that constantly sit on their eggs, or leave them only for a short time during the night. Eggs of a light-blue or light-green tint will also be found in nests that are otherwise well concealed; while, on the other hand, a great proportion of those nests that are in exposed situations have eggs varying in tints and spots in a remarkable degree, corresponding with the colours of external objects in their immediate neighbourhood. Thus a dull green colour is common in most gallinaceous birds that form their nests in grass, and in aquatic birds among green sedges; a brighter green colour is prevalent among birds that nestle among trees and bushes; and a brown mottled colour is found in those eggs that are deposited among furze, heath, shingle, and gray rocks and stones.

We find the same adaptations of colour to the objects immediately around them, and evidently for the purpose of concealment, among many defenceless animals, and among the young of many birds that follow their parents along the ground in search of food. Thus the colour of the hare is the same as that of the brown furze or half-withered grass among which it lives; the colour of many birds that perch in trees is of a congenial green; and so is that of many insects, lizards, and reptiles, that live among grass and green herbage. The young partridges can scarcely be discovered from the brown mould or withered grass among which they nestle, or the young grouse from the heather of a congenial tint.

The swallow is a bird that all delight to welcome, and to look at as it darts through the air; but few care for inspecting it nearer, for it has no great splendour of plumage; and its wide mouth, short feet, and untameable nature, make an intimacy with it rather to be avoided than coveted. 'Yet,' says Sir H. Davy, 'he is one of my favourite birds, and a rival of the nightingale, for he glads my sense of seeing as much as the other does my sense of hearing. He is the joyous prophet of the year, the harbinger of the best season; he lives a life of enjoyment amongst the loveliest forms of nature. Winter is unknown to him; and he leaves the green meadows of England in autumn for the myrtle and orange-groves of Italy, and for the palms of Africa. He has always objects of pursuit, and his success is secure. Even the beings selected for his prey are poetical, beautiful, and transient. The ephemeræ are saved by his means from a slow and lingering death in the evening, and killed in a moment when they have known nothing of life but pleasure. He is the constant destroyer of insects, the friend of man, and, with the stork and ibis, may be regarded as a sacred bird. His instinct, which gives him his appointed season, and which teaches him always when and where to move, may be regarded as flowing from a Divine source; and he belongs to the oracles of nature, which speak the awful and intelligible language of a present Deity.'

Every one has remarked the manner in which birds of prey float, as it were, without any effort, and with steady expanded wings, at great heights in the atmosphere. This they are enabled to do from the quantity of air contained in the air-cells of their bodies, which air being taken in at a low level in the atmosphere, of course rarefies and expands as the bird ascends into higher regions. Their rapidity of descent must be accomplished by the sudden expulsion of this air, aided by their muscular efforts. Of all birds, the condor mounts highest into the atmosphere. Humboldt describes the flight of this bird in the Andes to be at least 20,000 feet above the level of the sea. From the cave of Antisana, elevated 12,958 feet above the level of the Pacific Ocean, he saw this bird soaring at a perpendicular height of 6876 feet. It is a remarkable circumstance, says he, that this bird, which for hours continues to fly about in regions where the air is so rarefied, all at once descends to the edge of the sea, and thus in a few minutes passes through all the varieties of climate. At a height of 20,000 feet, the air-cells of the condor, which are filled in the lowest regions, must be inflated in an extraordinary manner. Many years ago, Ulloa expressed his astonishment that the vulture of the Andes could fly at a height where the mean pressure of the air is only fourteen inches. It was then imagined, from experiments made with the air-pump, that no animal could live in so rare a medium; but Humboldt has seen the barometer on Chimborazo fall to thirteen inches eleven lines; and Guy Lussac respired for a quarter of an hour in an atmosphere whose pressure was even less than this. At these heights, man generally finds himself reduced to a painful state of debility, while the condor, on the contrary, appears to breathe freely. Of all living beings, it appears to be the one that can rise at will to the greatest distance from the earth's surface. Occasionally, small insects are carried involuntarily even higher by ascending currents of air.

It is a beautiful sight, in a still lake, to watch the swan plying its way 'with oary feet,' or to see a flock of them

assume the double line, one behind the other, and meeting at an angle like the letter V. This is the practice of other aquatic fowl, as ducks and geese, not only in swimming, but when on wing high in the air. Does this double line and acute angle which they form lessen the resistance of the air or the water, and thus render the average flight of those in the rear easier? Undoubtedly, supposing the flock an individual mass, this is the exact form of angle which offers the least resistance to a fluid medium, such as air or water. This has been demonstrated in the case of a boat; but whether the same holds in the case of a figure formed of separate and distinct individuals, we are not mathematicians enough to determine. The presumption is in the affirmative, for nature does nothing in vain; and the fact that the bird in the van is successively relieved by those in the rear, would point out that the leader's efforts were greater than those behind, and required in this way to be relieved.

THE UXBRIDGE YOUNG MEN'S IMPROVEMENT SOCIETY.

As an exemplar which may be useful to young men of the middle and working-classes, who are anxious to find means of spending their evenings at once agreeably, and not idly or unprofitably, we present the following account of a Young Men's Improvement Society which has been established in the town of Uxbridge:—

'In the first place, we have a committee of twelve persons, chosen every twelve weeks from the list of members, the duty of each being to act as chairman for one week. We find the benefit of this plan to be a greater amount of order and regularity than when there is no one to preside. Our room opens at half-past six, and closes at ten. The routine of spending the time is as follows:—Monday night is devoted to the practice of music, vocal and instrumental—the vocal music according to Hullah's system; Wednesday, Friday, and Saturday, to reading; Tuesday and Thursday evenings, till nine o'clock, reading, after which, conversation on some given topic. We beg to say that we find the conversation nights to be the most attractive and instructive. The majority wishing to join in the conversation, and not liking to come unprepared, read, and get prepared, and thus a great amount of instruction is communicated; and it frequently happens that different opinions are entertained, thus causing a spirited, and, in our humble opinion, a good discussion. But we must here state, that we carefully exclude all religious controversy and party politics from our room, so that we have in our society persons of almost every persuasion, without any jarring or unpleasant feeling. We, like the Hampstead Society, pay twopence weekly, which more than covers our regular expenses; thus showing that working-men can support such societies without assistance. We have one newspaper, the "Illustrated London News;" and we are about to make arrangements for hiring the "Times." We have the "News of the World" the fourth day, sent by one of our members. We have "Chambers's Journal" and "Miscellany," and in our library the "Information for the People," and about thirty other volumes. We steadily increase our library. We have one or two magazines, contributed by members, and a great quantity of old periodicals, among which are six volumes of "Chambers's Journal." Many of the members practise writing in the room, though we have not at present a regular writing class. One or two are learning Latin. There is a peculiarity in this society that we have not noticed in any other. According to our rules, each chairman is expected to enter in a book, provided for the purpose, a journal of the proceedings of the society during the week he is in office. We find this plan productive of good, not only because we are able to refer to any part of the society's past history, but also because of the improvement in writing, no one liking to write in the society's book unless it be in a fair hand. We have hitherto had quarterly tea-meetings, which we have found exceedingly beneficial in promoting the interests of the society, as it brings all the members together, and gives a warmer tone to the proceedings: and it would not be egotistical on our part to say, that we have some tolerable speaking on such occasions from persons who could not, six months ago, stand up and say twenty connected words in the shape of a speech. We consider this improvement is owing to our conversation meetings, as all who join in the conversation are expected to do so standing.'

MAY FLOWERS.

SWEET flowers every one!
Ye put it in my mind to offer up
A thankful prayer to Him who fills my cup,
And sendeth beauty with the summer's sun.
Thought wanders joyful while your sunny bloom
And odours sweet enrich the passing hours;
Thought which forbids an anchoritish gloom,
And glows with beauty not unlike the flowers.
A welcome waits ye through this land of ours!
In southern vales or Scotia's wilder glen:
Where'er your glories fall in golden showers,
A welcome waits ye in the hearts of MEN!
For 'souls are ripened,' even while ye fly
The howling storm beneath 'our northern sky.'

'Twere well to learn of you
The skill to waken hope and pleasant thought!
And pour into the bosom nigh distraught,
The freshness of the heart, like morning dew.
To lift the head, and suffer truth to play
Upon the brow, like sunshine ever bright;
To cherish in the heart, though but a ray
Of potent love, to warm the mental light.
To rise from sloth, as ye from winter's night,
Rejoicing garden-land and forest dell;
With all the soul, with all the heart and might,
Aiding the brotherhood in which we dwell.
To learn of sweetest MAY, and kindly give
Blessings with open hand to all that live!

E. B.

TWO LITTLE BIRDS.

A SONG FOR THE YOUNG.

Two little birds on an evergreen tree,
Chirping and chattering, who can they be?
Two little fairies they seem in disguise,
With their gay-coloured wings and their rose-coloured eyes.
Hark, hark! they are talking; we now shall find out
If they really are fairies, and what they're about:
Says the one to the other, 'Sir, how do you do?'
'Pretty well, I thank you; but pray who are you?'
'I am the bird whom you've heard of so long,
And that whispers in every one's ear when they're wrong;'
'And I,' says the other aloud, sharp and shrill,
'Am the bird you have heard of, called Obstinate Will.
Many more listen to me than to you.'
'Alas!' says the first bird, 'and that's but too true!
For of fools there are many, of wise people few.'

[The above is from Mrs Kingston's *Vocal Music for the Young*. We once had an opportunity (Journal, new series, No. 1.) of mentioning, incidentally, the charming little songs produced by this lady. It is from an almost daily observation of the pleasure they are calculated to give to both old and young that we now more formally recommend them to general notice. The words (which, we believe, are by Mr Kingston) and music we rank alike in the very first class of successful attempts to provide mental aliment for the rising generation. Mrs Kingston has lately produced *Three Anthems, with an Accompaniment for the Organ and Pianoforte*, evincing, we understand, equal talent for the highest efforts in musical composition, as her songs show her to be possessed of in what is, perhaps erroneously, regarded as a humbler walk.]

PLEASURES OF ACTIVE LIFE.

None so little enjoy life, and are such burdens to themselves, as those who have nothing to do. The active only have the true relish of life. He who knows not what it is to labour, knows not what it is to enjoy. Recreation is only valuable as it unbends us; the idle know nothing of it. It is exertion that renders rest delightful, and sleep sweet and undisturbed. That the happiness of life depends on the regular prosecution of some laudable purpose, or lawful calling, which engages, helps, and enlivens all our powers, let those bear witness who, after spending years in active usefulness, retire to enjoy themselves—they are a burden to themselves.—*Joy.*

EFFECTS OF HABITAT ON ANIMALS.

If animals are dependant upon external conditions for their existence—that is, upon circumstances of climate, food, and the like—then must a change of these conditions be accompanied by a change, less or more, in the character of the dependant creatures. We think this is apparent from the fact, that different regions are tenanted by different species—a thing for which there would have been no necessity had the animal constitution been indifferent to the physical peculiarities by which it is surrounded. It does not affect the question under consideration, whether the various species now known have sprung from a common root, or whether the several continents have had creations peculiar to themselves. All that we are required to consider in the present instance are—the changes which have taken place under the observation of man—the curious modifications which alteration of habitat sometimes superinduces on the animal character. Such changes manifest themselves variously in different animals: in some species the general structure improves, in others it deteriorates; some merely exhibit a change in the colour or texture of their external coverings, others are so altered throughout, that they bear but a faint resemblance to the originals from which they sprang. It is to some of the more curious of these modifications that we mean to direct attention, premising that many are effected slowly, others rapidly; that some are fugitive, others permanent, and transmissible from generation to generation; and that, in general, they are so varied and uncertain, that it is as yet impossible to reduce them under any law.

One of the most obvious modifications produced in the animal economy by change of place, is increase or decrease of general bulk. Thus the horse or ox, taken from the arid plain or lofty mountain range, and depastured on low fertile valley land, will be found, after a few generations, to have established a breed of greatly enlarged proportions. The reverse holds equally true; and however much professed naturalists may talk of distinct and different species, there can be little doubt that the small shaggy horse of Tartary, the Welsh pony, and their still more diminutive cousin of Shetland, are but varieties of the common horse, moulded, after the lapse of many ages, by the conditions of habitat, into the miniature forms we now behold them. It is evident from the structure of the horse, that he is fitted for the dry and open plain, and not for the marsh or forest—a circumstance that implies lightness and compactness of form rather than ponderous hugeness. And yet we see the horse of Flanders, the Clydesdale breed, and the dray-horse of London, equalling, nay, sometimes excelling, the elephant in weight and dimensions; a result which, we know for certain, has been brought about by the condition to which man has thought fit to restrict them. But man could do nothing of himself in this respect, unless there previously existed a natural adaptability in the animal constitution; and the existence of such an adaptability is all that is necessary to establish the fact, that it must be affected by the external or physical conditions that surround it. We are not, however, without instances in nature of similar modifications, and these, too, brought about in a comparatively short period. The Falkland islands, which, when taken possession of about the beginning of last century, had no native quadrupeds except a large wolf-like fox, have since been peopled with horses and cattle from Spanish South America; and there the former have already considerably degenerated in size and power. 'All the horses bred here,' says Mr Darwin, 'both tame and wild, are rather small-sized, though generally in good condition; and they have lost so much strength, that they are unfit to be used in taking wild cattle with the lasso: in consequence, it is necessary to go to the great expense of importing fresh horses from the Plata. At some future period, the southern hemisphere probably will have its breed of Falkland ponies, as the northern has its Shetland breed.'

But while the horses have thus degenerated, the cattle seem to have increased in size, and, what is extremely curious, to have broken into different colours, each prevailing colour being limited to a certain part of the island. They also vary much less in the general form of their bodies, and in the shape of their horns, than English cattle, the individuals of each great group being extremely like to each other. 'Round Mount Usborne,' continues our authority, 'at a height of from 1000 to 1500 feet above the sea, about half of some of the herds are mouse or lead-coloured, a tint which is not common in other parts of the island. Near Port Pleasant dark-brown prevails; whereas south of Choiseul Sound (which divides the island into two parts), white beasts, with black heads and feet, are the most common: in all parts, black and some spotted animals may be observed. Captain Sullivan remarks, that the difference in the prevailing colours was so obvious, that in looking for the herds near Port Pleasant, they appeared from a long distance like black spots, whilst south of Choiseul Sound they appeared like white spots, on the hill sides. He is also of opinion that the herds do not mingle; and it is a singular fact, that the mouse-coloured cattle, though living on the high land, calve about a month earlier in the season than the other coloured beasts on the lower land. It is interesting thus to find the once domesticated cattle breaking into three colours, of which some one colour would, in all probability, ultimately prevail over the others, if the herds were left undisturbed for the next several centuries.' Here, then, in a limited space, and in a very short period, we have several re-

markable illustrations of the doctrine, that change of habitat is accompanied by a greater or less modification in the animal constitution which may be subjected to it. In the first place, the horse, transported from the more congenial climate and extensive pampas of South America to the inhospitable limits of these islands, degenerates in size, and slowly increases in numbers. Secondly, the ox seems to thrive better under the more humid climate, and on the ranker herbage; and not only so, but to be affected strangely as to its colours in different parts of the island. And lastly, what is most singular of all, the cattle inhabiting the higher regions of the island bring their young into the world a month earlier in the season than those living on the lower land —a result for which, like many others in nature, we know not at present even the shadow of a cause.

Another of the more obvious results of change of habitat on animals, is a modification either of the colour or texture of their external coverings. In torrid climates, the sheep loses its woolly fleece, and is covered with hair; the dog, when naturalised in Guinea, becomes almost naked, while a few seasons in the polar regions are sufficient to clothe the same animal with a dense coating of hair and wool. Similar changes likewise take place even when the habitat of the animal is stationary, provided it be subjected to the extremes of summer's heat and winter's cold. Thus, in the bleak regions of the north, the coverings both of birds and quadrupeds become, during winter, nearly double in quantity of what they are in summer; hair passes into a woolly texture; the feet of some birds become garnished with feathers; and during the same season colours of a dark or brownish hue pass into white. 'The Alpine hare,' says Mr E. Thompson, 'which is found in Scotland, is in summer of a tawny gray, while in winter it is of a snowy white. The ermine, which is also found in the British islands, has its summer coat of a reddish brown, but in winter it affords the beautiful white fur which is so generally known. The plumage of the ptarmigan—a bird of the grouse species, which breeds in Scotland—is of an ash colour, with dusky spots in summer, and of a pure white in winter.' The advantage of such modifications is abundantly evident: wool is warmer than hair, and a white colour radiates or gives off the internal heat of the body more slowly than any darker colour. But as no animal can produce such changes in its covering by any act of volition, we must ascribe the result to change of temperature; and as a certain degree of winter's cold in Scotland, for example, is just equivalent to a permanent removal to a northern latitude, so we may expect a northern habitat to produce all similar changes on animals of a southern origin. Proceeding upon this doctrine, M. Gloyer of Breslau, who has devoted much attention to the change produced in the plumage of birds by climate, has arrived at the following conclusions:—The black colour, or dark-brown, becomes darker as the animal approaches the south; lighter towards the north. The gray, or brown-gray, remains nearly the same when it is not mixed; but when it is rust colour, or blue-gray, or slate colour, it becomes black in the south, or, on the contrary, white if it be mixed with whitish gray. In the north, the gray and the brown-gray become lighter, or are changed to white. The different shades of rust colour are those which, in warm countries, have the greatest tendency to deepen, and to spread all over the animal. Pink, and the colours which approach to it, suffer the least modification. Blue, green, yellow-green, escape almost entirely the influence of climate. The beak and feet undergo similar changes; that is to say, if the colour of the bird becomes darker from the effect of heat, these take also a darker hue. These conclusions were remarkably corroborated by the case of some American hares (*Lepus Americanus*) which, according to the statement of Colonel Smith, were shipped for Europe quite white, but at the end of twenty days had turned quite brown. The hairs were not shed, and the change must have taken place in the hairs themselves. Again, the otter, which in Scotland is of a sooty black above, and of a pale colour on the under parts, approaches, in the south of Ireland, nearly to black, both on the upper and under surface, and assumes larger ears, and some other minute differences of structure. So different at first sight does the animal appear, that certain naturalists regard the Irish otter as distinct from his Scottish brother.

In man, too, as in the lower animals, such modifications are abundantly evident; the only difference being, that, as he advances in civilisation, his ingenuity endeavours to render all habitats alike agreeable, and he thus insensibly counteracts the free operation of natural causes. M. Gloyer is of opinion, for example, that if the characteristic of blue eyes and fair hair, which antiquity has attributed to the Germans, is no longer so generally found to exist in Germany, it proceeds less from admixture with other races than from the softening of the climate by cultivation. Now, should this doctrine be correct, it must follow that the red-haired, blue-eyed Scandinavian, if removed to the climate of Spain or Italy, will, after a few generations, assume the dark hair and eyes so generally characteristic of the natives of these countries. And extending the doctrine still farther, there is no known opposing reason why the northern Asiatic and European should not, in course of time, exhibit the bronzed complexion of the Malay, or the sooty skin of the negro, together with their other constitutional peculiarities, were the proper conditions of an Indian or an African habitat imposed upon them. This brings us, however, to a much-controverted point—a subject as to which naturalists and ethnologists are far from being at one; namely, whether the white and coloured tribes of mankind belong to the same race; in other words, whether, in process of generations, a European, subjected to African influences, would not assume the sooty skin, the woolly hair, and thick lips, and other peculiarities of the negro? Laying aside all argument in the meantime, and bearing in mind the wonderful effects which habitat is capable of producing on other animals, we incline to the convertibility of the races, and believe that, in lapse of ages, either would assume the characteristics of the other. We know, for example, that Europeans, after a few years' residence in India or Africa, assume a dark complexion; and in some instances is this change so rapidly and strongly effected, that the individuals, were it not for their features, could not be detected from the natives. This, then, implies a similarity in constitution—the existence of a pigmental apparatus in man, which only requires certain conditions of habitat to develop its functions. How long it would require to stamp a European race with the thorough characteristics of the negro, or *vice versâ*, we do not know: no proper trial has ever been made; and though the experience of several centuries lies before them, ethnologists seem rather to indulge in their own hypotheses, than begin to collect data from actual existence. This only we are assured of, that if there exist in nature such a law as M. Gloyer has endeavoured to shadow forth in reference to the inferior animals, then is mankind by no means exempt from its influence. Indeed we have a striking example of its effect in the case of the Americans. The United States, peopled by English, Scotch, Irish, French, and Germans, have in the space of a couple of centuries produced a style of figure and physiognomy different

from any of the originals—a style so peculiar, that we know of no European traveller who has failed to remark it.

But it is not alone in mere bulk, in proportional size of certain parts, in the kind and colour of external covering, or in the general appearance of animals, that change of habitat exhibits its influence; there are various constitutional results of an important nature which it is equally capable of effecting. Cretinism—that terrible scourge of Switzerland—it is now ascertained, can be cured by transferring the patients from their low valleys to the high mountains; and at a distance of three or four thousand feet above the level of the sea, these unhappy creatures are no longer met with. To diminish the number of Cretins in the narrow valleys of the Alps, the Swiss government has accordingly founded an institution on a mountain in Berner Oberland, for the physical, intellectual, and moral development of children who, in their infancy, present indications of this unhappy condition. The establishment, though of very recent origin, is said to be fulfilling the purpose intended; and this, be it observed, not owing to anything partaking of medical treatment, but simply to change of habitat. *Plica Polonica*, another disgusting disease, common in Poland, Lithuania, and the adjacent parts of central Europe, is not known beyond these limits, being therefore essentially the result of habitat. The same may be remarked of the Guinea-worm, to the attacks of which stranger and native are alike subject within a certain range of the tropics; but which have happily never yet been experienced beyond that range. Again, hydrophobia, so much dreaded in our own country whenever an unusually hot summer sets in, is totally unknown in much warmer latitudes; as, for example, in Egypt, where the heat is often oppressive, and where the dogs prowl about the streets, living on offal and garbage, uncared of, and uncaring for, any one. Passing, however, these and other affections, which may in some degree be regarded as accidental, there are many structural changes, the effects of habitat, which, though minute, are not the less curious and instructive. The offspring of birds, which, in the adjacent continent of America, are garrulous and noisy, have become silent and dumb in the islands of Polynesia; and the progeny of shipdogs left on the coral island of Juan de Novo, have, after the lapse of a century or so, entirely lost the faculty of barking. The tuskless, bristleless, domesticated pigs which the French and Spaniards introduced into the Falkland islands about the beginning of last century, have now become a wild fierce race, with great tusks and stiff bristles, some of the old boars of which would do honour even to Erymanthus. The rabbits, too, have so much changed, not in mere external covering only, but in conformation of head and jaw, that Cuvier himself, ignorant of the fact of their origin, regarded the skull of one which was sent him as a distinct species; thus once more showing the absurdity of founding specific distinctions upon trifling details. These, and many other examples which might be adduced, all tend to prove how much animal nature is affected by habitat, and how much it depends for its development upon the physical peculiarities which surround it.

The ductility or adaptability in the animal constitution which we have here pointed out, is one of the most important arrangements in creation. Through it the creatures which people the globe are prepared for certain changes of climate, food, soil, and the like. Without such a provision, every change of external conditions would have been attended with pain and inconvenience to life, if not with its extinction. Again, it is essential to the peopling of this earth, which, in all its parts, seems to have been destined to be the theatre of life and enjoyment; for, without such a law of adaptability, every little section of surface must have had its own peculiar creation, or lain a blank, unfit for the reception of the inhabitants of other sections previously peopled. Further, taking an economical view of the matter, it is of the utmost importance to man, inasmuch as, by proper attention, he can mould, as it were, the inferior animals to his peculiar wants and wishes. Where, for example, is there in nature an animal like the dray-horse of London, cattle so well adapted for human food as the Durham oxen, or sheep so large, and plump, and nutritious as the Leicester breed, which Bakewell took so much pains to propagate and perfect? This elasticity in animal nature, however, must have its limits, beyond which neither man nor the inferior creatures can pass with impunity. We do not expect, for example, the camel to accommodate itself to the snows of Greenland, nor the reindeer of the Esquimaux to luxuriate on the deserts of Africa. And yet we know nothing of the limits to animal adaptability: nature often brings about the most important and gigantic results by the slightest and most imperceptible causes.

THE RIFLE, A TALE OF ARKANSAS.

BY PERCY B. ST JOHN.

Benjamin Smith was perhaps the tallest, most gallant, and popular of all the backwoodsmen in the state of Arkansas. Young, of manly bearing, and possessed of great energy, he had, out of a dense plot of forest land, formed in two years, aided by a small capital, an excellent farm, with a clearing of several acres. It happened, however, just as this farm was completed, and Benjamin was thinking of commencing operations which should remunerate him for all his labour and expense, that his capital was exhausted. To almost any but an Arkansaw backwoodsman this would have been a terrible blow; but Ben was somewhat of a philosopher, and accordingly, one fine morning at daybreak he left his hut, and seating himself on a blackened stump near the door, ruminated on what was to be done. He gazed with admiration upon his house, the work of his hands, on the fenced acres, on the huge piles of wood which his own exertions had reared around, on a stream close at hand, and appeared suddenly struck with the conviction that he really was a very lucky fellow. He had all the elements of happiness within his reach; but something still was wanting. Across Ben's knees was his long narrow-bored rifle; his powder-horn and pouch hung beside him; in one hand was a knife, in the other a piece of wood, which, in order, we suppose, to conduce to the concentration of thought, he was whittling at in the most determined manner. Chip by chip fell around him; the thick pine-staff was soon reduced to a bundle of insignificant shavings; and just at this instant our hero appeared to arrive at a satisfactory solution of his difficulties. 'Well,' thought he, 'I wish I may be shot if it is'nt a wife I want! I've got the log, and the clearing—I can find meat in plenty while I have this rifle, and that's a real fact; but I want a wife to prepare my dinner, and talk to me when I come home; and I do believe I should like to have a chap about as high as my boot to call me "Pa!"' And then the vast bulk of the Arkansaw backwoodsman was shaken with inward laughter. 'Well, it's about the greatest thing I've hit upon for some time; but I don't exactly realise how it is to be done. One thing is certain, wives don't grow on trees like hackle-berries, and I must go to Little Rock.' With these words the young man rose, and advancing towards the hut, fastened the door, and shouldering his rifle, at once began his journey of fifty or sixty miles.

Little Rock, in Arkansas, on the frontier of Texas, is perhaps the most disreputable town in the whole United

States; but neither there, nor at the White Sulphur Springs, are the enormities practised which travellers would persuade us to credit. Still, though Ben ran no danger of being choked by being forced to 'bolt' a hearty meat-dinner in two minutes and a half, nor of being gouged, nor shot across the street by accident, nor, by committing murder, getting 'canonized, and elected into the States' legislature,' it was rather dangerous for one of his rustic character to be domesticated in a town where men of such idle, lazy, and swaggering habits were assembled. Though Little Rock be not strictly an 'Alsatia for all kinds of thieves and gamblers, forgers, horse-stealers, and the like,' though 'gouging, stabling, and shooting' be not the principal occupation of the people, still, being a frontier town, whence escape into the then independent republic of Texas was easy, it was naturally the resort of a large number of the class enumerated; a class, despite all that has been said, not more numerous across the Atlantic than in some places nearer home.

Ben might easily have found in Little Rock a place of residence suited to a man of good feeling and moral principles; but, used to the woods and wilds, and the society of rough, good-humoured, and well-meaning borderers like himself, he yielded to the request of the first stray acquaintance he met, and accompanied him to about the very worst boarding-house in the place. We should be sorry to induct our readers into the mysteries of such an establishment; suffice it, that Ben saw and heard enough to have made any thinking man take to flight. But Ben, who had required two years to find out that he wanted a wife, was not likely to discover in one evening that he was in a false position; and so rapid, with a simple-minded man, is the process of contamination from evil communication, that that one night sufficed almost to ruin our hero for ever. Giving way to drink—the root of the greatest amount of crime—the backwoodsman forgot himself. From drinking a little, he advanced to much. Before, however, his reason had become completely prostrated, he noticed, sitting in one corner, a man who, from his dress and appearance, appeared one of the many Poles who had taken refuge in the United States. Quiet, unobtrusive, and silent, he joined neither in the song nor the maddening games which served to murder time; but with a modest glass before him, which remained almost untouched, interfered with no one. At length a fellow called on him to join the company, and be sociable. The Pole, with a mild bow, that seemed to speak his sorrow at his situation, replied that he never drank or gambled. The fellow, irritated at what he chose to consider a covert sneer, would have quarrelled with the old man; but Ben interfered, and declared that, before the Pole should be injured, they must take his life. There was a fire in the squatter's eye that silenced the bully, and the Pole remained unmolested. But time passed, and Ben drunk deep and played deep; and on retiring to bed, money, rifle, and everything but the most necessary articles of clothing, had changed owners.

Morning came, and the borderer felt that his expedition in search of a wife had had a bad beginning. There was something, he was sure, radically wrong; but before he could arrive at any satisfactory conclusion as to where the error lay, his companions had joined him, and without much difficulty persuaded him to endeavour a redemption of his evil fortune. To spare ourselves the pain of narrating the fall of our hero, we may at once state that, at the end of a fortnight, he had become an accomplished specimen of a Southern loafer, as idlers are called in the United States. One afternoon, at the expiration of this time, reduced to beggary, without the arms which might supply him with food, Ben walked through the well-laid out town of Little Rock in search of the refreshing influence of the open air. But he was no longer the sturdy woodsman, who could fell an ox, and eat him too, in no very considerable period; and as he strolled along, he grew faint and weary. Looking round for a shady spot where to rest his easily-fatigued limbs, the squatter discovered a pile of logs, close by an uninhabited house, and opposite to one which was occupied. It was advancing towards evening, and Ben was here about to give way to the gentle influence of the hour, and fall into a deep sleep, while nature was veiling her beauties for the night, when his eye accidentally wandered to a window opposite, at which sat at work a young and lovely girl—the very being, it seemed, of which he had dreamt when seated on his old stump opposite the hut reared with his own hands. Ben rose to a sitting posture; and scarcely daring to breathe, lest he should scare the beautiful vision, gazed upon her with delight and admiration. Her feminine occupation wholly absorbed her attention; and for some time the squatter enjoyed the pleasure of seeing such a creature as he felt would make the woods more delightful than the famed earthly paradise of ancient days. Suddenly the door of the house opened, and the old Pole, coming out, advanced rapidly towards our hero.

'My good friend,' he said, 'allow me to thank you for the generous manner in which you lately interfered to save me from insult. I was that night houseless, and forced to take shelter where I could, and unfortunately did so at the boarding-house, where I escaped injury only through your kindness.'

During the delivery of this speech, Ben had remained with open mouth staring at the interlocutor, and blushing like a girl fresh from a boarding-school. Decidedly there was good in Ben at bottom. When the Pole concluded, he muttered some incoherent words, at which the other smiled, and invited him to follow him into the house. The young man arose, as it were in a dream, and walked behind the stranger without saying a word. To his surprise and confusion, the old man led him into the very room occupied by the young girl, to whom he was introduced as the bold youth who had perhaps saved her father's life on a late occasion. While Ben was overwhelmed with varied feelings, the daughter of the old Polish officer rose, and welcomed him with the most unaffected kindness; and before half an hour was over, the rude squatter was seated at the evening meal of his new friends, who, though poor, had still more than absolute necessaries. Encouraged by the friendly hospitality of the European fugitives, Ben at length, partly to extenuate his own late acts, frankly told his story. The manner of the old man, hitherto kind, but a little protective, became cordial and pleased. When the squatter told how he had, after two years' thought, come to the sudden conclusion that a wife, and in due time a family, would wonderfully enliven his rude log-hut, the daughter was inclined to laugh; but a glance at the deeply-moved young man, a tear that glistened in his eye, the look of hopeless admiration that he cast upon herself, restrained the feeling, and Emily Duraski scarcely spoke another word that evening. Some matter of deep moment appeared to engage her whole thoughts.

When the young man had concluded, Colonel Duraski—for such was the father's name—rose, and going to another room, presently returned with a magnificent rifle, and all the necessary appurtenances. These he laid beside Ben. 'Young man,' said he, 'you have erred grievously; but a steady resolution to act honourably will restore the greatest evil-doer to society. Without arms, you are powerless in the woods. Take these; but, as I am a poor man, I make this reservation—you must make over to me your farm, and you

must not go near it for three months. If, at the expiration of that period, you can pay me for this rifle, I restore you your home; if not, it is mine for ever.' Ben, under the influence of the daughter's beauty, agreed to and signed everything; and an hour afterwards, left the house a rifle and its accoutrements the richer, but, unless he could raise a hundred dollars, for ever deprived of his hard-earned home. But Ben hoped. There were buffalo, bears, and other wild animals in the woods, whose skins were valuable; and the backwoodsman resolved to earn the rifle, and preserve at the same time his farm—and who knows what ambitious views were behind?

Distrusting his own powers of resistance, Ben Smith left Little Rock behind him at once; nor did he pause until he had placed it ten good miles behind him. He then found himself in the very thick of a virgin forest, with deep darkness settled over all nature. With the circumstances, returned all Ben's woodcraft and joyous love of a night beneath the blue sky, alone amid the overhanging sycamores, oaks, and beech. To collect wood, to make a roaring fire, and to spit a wild turkey, shot while roosting, was the work of a very short time; and then the young man sat down to await the moment when his evening meal should be ready. His first thoughts took an unlucky direction. He recollected that, on the previous night, instead of being alone, he was rioting amid excited and applauding companions, and, from the habit of such false excitement, he now felt low-spirited, and without hope. From being gloomy, his thoughts became evil. On his pale face, as the flicker of the blazing logs illumined it, one might have read the struggle of strong and angry passions. He gazed with admiration at the beautiful rifle at his feet: he felt that he could never part with it. But why should a stranger claim his inheritance, his home, the work of his hands, if he failed to raise a hundred dollars? The very idea of being deprived of his hut and clearing worked him up to fury, and, as he sat beside the burning fire, he vowed in his heart that the Pole should never own his home. Fierce and terrible were his impulses; in thought he had been a very murderer. While he already gazed around with terror and alarm at the gloomy vistas of the forest, as if expecting the ministers of vengeance to come forth, there arose before him another picture. It was as if he had dreamt a dream. He sat within a rude but warm hut, furnished, as the industrious and painstaking pioneers of civilisation usually furnish their homes, with all that is necessary, and nothing that is superfluous. A bright gladsome blaze rose upon the mud-made hearth, casting its cheerful light upon a room which contained other charms than the creature comforts. An old man slept in a rough arm-chair; a lovely woman gazed upon the dreamer with affection; while on his own knees, and in his arms, and on the ground, and in every imaginable place, were little cherubs, whose faces were so very like his, and so very like hers, that to tell whom they really resembled was impossible. Ben started. He had really dozed; but it was perhaps the most fortunate doze that ever happened to man. Heaving a deep sigh, a sense of his own unworthiness came upon him; and the reflection that, had he acted with common prudence, he might with ease have realised the exquisite picture which had come upon him with all the calming influence of the domestic affections, made him see in its true light his late inconsiderate and foolish conduct. Ben, as he now ate his meal, for once in his life thought with rapidity, and determined to act with energy and good-will. His bitter feelings against his Polish benefactor made him blush with shame, and he resolved that the rifle, which he admired so much, should be paid for even with interest.

For about a month the backwoodsman wandered through the vast woods of the Arkansas, hunting with indefatigable zeal, and collecting the results of his chase in a small cavern, where he took up his quarters, at no great distance from his former location. One night, on returning home heavily loaded with spoils, as he stepped up towards a hole in the side of a rock, in which he was about to rest himself for the night, an angry growl made him hesitate and drop his burden. The practised woodsman recognised in the sound the peculiar tones of a panther grumbling over a bone. It was almost pitch-dark, and yet Ben fired by the dim gray light of a few stars; and his shot told. The next instant the panther was upon him. The hunter dropped his rifle, and clutched the long knife which every Arkansaw borderer carries at his belt. The wounded beast flew to his left shoulder, which it grasped in its teeth with an energy and ferocity that would have proved fatal, had not the long bright blade gained the panther's heart at the same instant. The beast growled, let go its hold, and fell dead. For a moment Ben stood erect, proud and glad of his victory; but the next instant he felt a sensation of pain in his shoulder and left arm, which satisfied him that he was dangerously, if not mortally wounded. It had been from a natural feeling that he selected for his new abode a spot within two miles of his log-house; and thither, after hastily stanching his wounds, it seemed necessary that he should attempt to go, though he should die on the way. Fearful that faintness might overcome his strength, he immediately proceeded on his journey, and in less than an hour was in sight of his home. Since his unfortunate visit to Little Rock, he had not approached it any nearer than the scene of his late struggle. When he now stood within the clearing, astonishment rooted him to the ground. Cattle lowed, pigs grunted, a watch-dog barked, and smoke curled from the chimney. From the half-open door streamed the light of the blazing logs. Ben paused irresolutely; his heart beat with a strange and wild violence; but faintness was creeping over him, and, mustering courage, he staggered towards the door, and having reached it, fell insensible within the walls of his own log-hut.

It was some time ere Ben revived, and then his surprise was still greater than before. The old Pole and his lovely daughter, with two farm-labourers, stood around him.

'Well, my friend,' said the Pole, while concluding the dressing of his wounds, 'you are come sooner than we expected; but you are right welcome. How come you to be in this terrible state?'

Ben could not reply: his whole faculties were bent upon the lovely being who stood, pale and anxious, waiting his recovery.

'Nay, father,' said Emily Duraski, a faint blush illumining her features, 'he is not yet strong enough to speak.'

'The rifle!—the rifle!' cried Ben at the same moment; 'send your men in search of it;' and in a few rapid words he explained where it would be found.

Colonel Duraski took note of the directions, and, followed by his two men, leading a horse, hurried himself in search of the valuable instrument. Ben and Emily were left alone. The latter immediately attended to the sufferer's wants, gave him a strong and refreshing cup of tea, made him a meal so comfortable and tempting, and hurried about with a zeal so ready, that it went to the backwoodsman's heart. As he lay on his couch, and gazed upon her as she moved about, her very manner lending a charm to everything, Ben felt that he again saw her who alone could make life in the woods joyous and happy. At length she came and seated herself beside him, having ministered to all his wants.

'How shall I ever thank you,' said poor Ben, a deep shade of stern sorrow settling on his face, 'for all this gentle kindness—I that deserve nothing?'

'Say not so,' replied the girl warmly; 'you deserved all when you saved my father from contumely and insult. He was seeking such a farm as this when you met him. But, Mr Ben Smith,' continued Emily in the most bewitching and fascinating manner, while a faint colour again flushed across her face, 'I abjure

you, in the name of everything that makes me thank you, to be frank, and tell me why you look so miserable?'

'My wounds,' began Ben confusedly.

'No—you are too much of a man for that,' said the girl gaily. 'I insist upon your speaking the truth.'

'Lady,' replied Ben gravely, 'I will. I am well aware I shall merit your contempt and scorn. I have seen you but twice, Miss Duraski, and the poor backwoodsman has dared to love where love is hopeless.'

'And that is all?' began the lovely Polonaise with a smile; but, checking herself, she said gravely, 'I thank you for your frankness. I knew, however, before you spoke, that you did feel for me some such silly fancy; and had I not had some idea that my father entertained a wish—that is, had an idea—that—that you might like me—I——' But she could go no farther, for Ben, giving her no time to conclude, seized her hand with a wild stare, so utterly madman-like, as to cause very great alarm for an instant to the young lady.

'Your father had some idea?—I am dreaming—but I am not able to bear this suspense. I cannot. Miss Duraski, if your father accepts me as a son-in-law, what will be your answer when I put the question to you?'

She made no reply: her head was bowed down: the rich crimson rushed in full tide to her cheeks; and then, mastering courage, she said, 'I believe I should prove an obedient daughter.'

Ben jumped up: his wounds were forgotten. It was too much for the huge Arkansaw, however. He attempted not to approach his half-betrothed bride; but after dancing round the room for a minute, burst into a loud and prolonged fit of laughter. A few seconds recalled him to reason; and then, taking the fair girl's hand, he poured forth, in his rough way, such a history of his feelings for the month previous, as made the Polish beauty alternately smile and weep. The borderer's frank and manly bearing made him rise rapidly in her estimation, and when the father returned, they were so deeply engaged in mutual professions of esteem, that they noticed not his entrance. Their proximity, and the girl's hand unresistingly held by the young man, spoke volumes. As they were both taken by surprise, they had presence of mind not to affect concealment. Neither moved.

'Hollo!' cried the colonel; 'you are a pretty sick man, to be sure—in half an hour to wheedle yourself into my child's good graces!'

'Not in half an hour, father,' said Emily, rising and advancing towards him. 'Recollect, for a month past, you have been showing me the great advantages that would accrue to me by becoming mistress of this homestead; and you see I have been mercenary enough to make sure of it at once.'

'So, then, all is arranged?' said the colonel with a laugh.

'Everything but the day,' exclaimed Ben boldly.

'I thank Heaven it is so,' said the Polish exile solemnly: 'I could wish for my child no better fate than to be your wife. I return you your house, and give you the rifle.'

'You will do neither, my dear sir. I have, I think, earned the hundred dollars; and as to the farm, I have a particular desire it should come to me as your daughter's portion.'

The young man was right. He had earned his rifle. A happy and gladsome sight were the three that evening—the worthy father, the proud lover, and the girl, discovering each moment in her future husband some new trait that made him worthier in her eyes. They were married; and on the occasion of the wedding, everybody remarked with curiosity that the bride wore a short cloak, lined with a panther's tawny hide. Various were the surmises; but none knew that to the original owner of the skin was perhaps owing the present happy union. It was happy.

In due time Ben was called 'Pa!' at which he laughed until Mrs Emily Smith thought he would never stop.

'Well,' he said, 'my dear wife, I do realise it at last. I am a happy husband, a proud father; and all, my dear sir,' addressing the Pole, 'through our bargain about THE RIFLE.'

LANDING AT LISBON.

AFTER an average amount of tossing in 'the bay,' and of contrary winds, and consequent grumbling along the inhospitable coast of Spain, we found ourselves safe in the Tagus, soon after the fall of a February evening. The sweet soft air told us pleasantly of the many leagues we had come in the five days since we took our last look at England. The lights of Belem, a village about two miles below Lisbon, lay in long bright reflections on the smooth river, and a rocket flew hissing up into the dark sky, to announce the arrival of the steamer. Immediately a boat went ashore with the mails, and her majesty's lieutenant in charge of them. A party of Portuguese custom-house officers came on board to watch us; and, despite our impatience, there was nothing to be done but await the morning as quietly as we might.

With daylight all quiet ceased. We proceeded up the river to opposite the custom-house; and from the moment we dropped anchor there, Babel itself could hardly rival the din which pervaded our little vessel. A swarm of noisy Portuguese, from the health-office, custom-house, passport-office, and I cannot tell how many more offices besides, came bustling on board, talking, as is the custom here, at the very top of their voices, poking about in every corner, and putting everybody out of temper. Besides this, we were surrounded by a crowd of queer-looking boats, whose owners were clamouring for passengers; coal barges were alongside, for the steamer takes in coal here; the passengers' luggage was being hoisted on deck; and Spanish peasants, whom we had taken on board at Vigo, and who had lain ever since, huddled under capotes and blankets, in a sort of bivouac round the funnel, nestling together in families, now roused from their lairs, were adding (men, women, and children, all talking at once) no small quota to the general uproar. However, while our ears were tormented with this abominable discord, our eyes were charmed with a scene of uncommon beauty. Lisbon lay before us, shining in the morning light, throned on her seven hills,* surrounded by brilliant verdure, and reflected in a broad mirror of water. Immediately above the city, the Tagus spreads into a lake eight or nine miles in breadth; and across the smooth blue surface were gliding innumerable broad white sails of the country boats. A few merchant vessels of all nations lay immediately around us, and in front was the custom-house—a noble building; and, what is strange in Lisbon, finished. Looking at the white buildings, as they rose pile above pile from the water's edge till they were relieved against the blue sky, it was impossible to fancy that we were admiring the 'dirtiest capital' in Europe, but after-experience has taught us the melancholy truth of the nickname.

At length we were informed that we might go ashore; and without more ado, we were huddled into a large boat. Our luggage went in another; and as we watched its transference to a tribe of half-clothed, savage-looking porters, many were the despairing glances we cast towards it, half doubting the possibility of its coming back in safety to its rightful owners. A few minutes brought us to the quay. Landing would have been pleasant *anywhere*, but here it was actual enchantment. In front of the custom-house is a broad terrace, laid out as a public garden, and full of the most beautiful flowers, then (February 21) in full blossom. Heliotropes, twelve feet high, covering wide spaces of wall, and literally one mass of purple blossoms; great bunches of calla, with

* Lisbon is said to stand, like Rome, on seven hills. A stranger is apt to fancy them seven hundred, so continual are the ascents and descents in her steep fatiguing streets.

half-a-dozen large white flowers in a group; scarlet geraniums in luxuriant bushes; and many more showy plants, with the bright young leaves of the banana, and the little yellow balls of the mimosas. The delicious fragrance, as well as the beauty of this garden, was delightful. At Lisbon, nobody hurries himself, so we had a good while to wait at the custom-house; but no trouble was given us, and we were allowed to go away after a very slight examination of our luggage. Passing through the building, we found ourselves in a very large and handsome square, with public buildings and colonnades on three sides of it, and a fine quay on the fourth. In the centre is a large bronze equestrian statue, in the style of the last century. Short time, however, had we to admire it; for, with a shout and a rush, down came about a score of ragged, bare-legged porters, each seizing on some article of our baggage, over which they fought and scrambled like dogs over a bone; and for some minutes there was such a ridiculous scene, that we could only stand by, and let them fight it out among themselves. Order was restored at last, and four stout men carried off the prey from the rest of the horde. Taking a carriage from a stand in the square, we set off towards the summit of the city, to a quarter called Buenos Ayres, where we intended to take up our abode. The carriages here are very odd things: a little body, like a cabriolet, perched on excessively high wheels; some with springs, some without, drawn by two strong little horses, or more commonly mules, on one of which rides a tall driver, generally wrapped in a great cloak, and wearing a broad hat, with tufts and tassels flying about it; his legs encased in great boots, with formidable spurs, and his feet appearing as if they must touch the ground. Away we went at a quick pace, up hill and down hill, no matter how steep; the horses half running, half sliding, but by some miraculous dexterity never coming down.

The streets are not generally narrow. The houses are high, commonly painted yellow or red, or faced with blue and white tiles (such as are called Dutch tiles), which produces a pretty effect; cool, and clean, and well suited to the climate. They have all balconies, on which are generally a set of flower-pots, and very often a screaming parrot. The shops have their fronts painted all over with representations of the articles for sale within, sometimes as high as the second floor. Very little is to be seen at their windows, and they are all shabby-looking. The principal trades have each a street to themselves—the goldsmiths, silversmiths, workers in ivory, shoemakers, &c.—which is a convenience to purchasers. There is very little appearance of bustle, and nothing approaching to a crowd in the streets; neither are there the bright colours and gay costumes of a French or Italian town. The universal dress of the women is a dark cloth cloak, and a white handkerchief on the head. The cloak they wear even in summer, averring that it keeps out the heat. The only gaily-dressed person is now and then some dandy muleteer, with bright waistcoat, braided jacket, and scarlet sash, with gay housings on his mule. The great number of negroes is a peculiar feature in the street population; they are from Brazil, and, particularly the women, are often very picturesque figures. There is a great deal of beauty, of a peculiar style, among the lower orders of women here, which one comes gradually to admire more and more. The men cannot be called a handsome race.

In the streets of Lisbon there is great diversity. That part of the town which was destroyed by the great earthquake was rebuilt on a regular plan; and there the streets are broad and straight. The older ones are much more picturesque, and very ill-built. In the principal thoroughfares there is considerable neatness. The roads are swept, and even now and then watered, and some sort of drainage is effected; but in the older ones prevails the primitive usage of emptying everything out of the windows, so that before every house is a mass of the most disgusting dirt, and a smell which defies description. Day after day the abominations accumulate, till some heavy rain comes to wash it down the hill-sides. The nuisance is also, in some degree, kept under by a pack of ugly mongrel dogs, which—earless, tailless, and masterless—roam day and night about the streets, feeding on the relics of bones and fish which lie about—disputing the sovereignty of the place with swarms of cats equally independent, and equally deprived of ears and tails. In some streets at night the dogs are said to be a great annoyance to a solitary passenger, whom they will follow in a pack, like wolves. Now and then in summer, the nuisance becomes unbearable, even to the police: then ensues a massacre, and every dog which cannot give a satisfactory account of himself is put to death without mercy. The dirt of Lisbon, however, is yielding to the march of improvement. No house is now allowed to be built without drains; and old residents declare that the city is purity itself compared with its state twenty years ago. Indeed, judging from the descriptions of it published at that period, the improvement is very striking. There are some streets very well macadamised, in place of the old pavement of sharp stones, and the town is very respectably lighted at night.

The supply of water is abundant enough at this season of the year. The principal stock is brought from about ten miles off, by means of a noble aqueduct, built about a hundred years ago. It is distributed in numerous fountains, round which gather the water-carriers with their barrels. These are a very numerous class, amounting to between three and four thousand men, divided into companies of twenty-five, over each of which is placed a captain. Each man is numbered, and is obliged to wait his turn at the fountains to fill his barrel. The captains have the privilege of taking water whenever they please, without regard to rotation: domestic servants are also allowed to do the same. The water is carried about in small barrels, containing five or six gallons or more, the price of which, when there is no scarcity, is about a halfpenny, as they are cried along the street; but if ordered from the fountain, the cost is double. In summer, occasionally as much as sixpence or eightpence is paid for the same quantity. The supply in the great aqueduct is never completely exhausted; but it sometimes becomes quite inadequate to the wants of the city; and water has to be brought in boats, at great expense and labour, from the other side of the Tagus. The water-carriers are bound to attend at all fires, and render assistance, under the orders of their captains. The moment an alarm of fire is given, notice must be communicated to the nearest church, when the bell is rung a certain number of strokes; the number indicating the parish or quarter where the fire is. The signal is instantly repeated by all the other churches throughout the city; and in a very short time the watermen are on the spot, with the greatest regularity and order. The number of water-carriers, with their long plaintive cry in the streets, is one of the novelties which strikes a stranger on his first arrival in Lisbon.

The vehicles in the streets are of the most original description. Besides the odd cabriolets already described, there are quaint-looking family coaches, such as one sees in pictures of the last century, drawn by four mules, and curiously painted with gay designs; and others, like old English postchaises, perched on high wheels. The only carts are of the very rudest description—rough planks, knocked together like a packing-box, and resting on a broad beam of wood as an axle; the wheels as nearly solid blocks as possible. They are always drawn by oxen; and as the country roads, or rather tracks, are very narrow, the drivers of ox-carts allow the wheels to remain always ungreased, that the creaking noise may give notice of their approach, and consequently the noise is dreadful. The oxen are large, handsome beasts, not very humanely treated by their drivers.

Buenos Ayres is a pleasant sort of suburb, though there is no interval between it and Lisbon. It is built

on the very top of the hills, overlooking a most beautiful view by land, and also down the Tagus, to the bar and the sea. There are a great many pretty gardens in this quarter; and it was very pleasant to see the golden oranges shining over the walls, and the long hedges of geraniums. In this part live most of the English residents; and there are omnibuses all day long to and from various parts of the city. A most respectable Englishwoman keeps a hotel at Buenos Ayres, where strangers may find perfect cleanliness and comfort.

OCCASIONAL NOTES.

STATE OF THE ENGLISH ARMY.

A NEWSPAPER remarks, that the late Indian war shows the English army to be unrusted by peace, and in an unprecedented state of efficiency. We agree in the fact; but there occurs to us a remark upon it which no one seems to have thought of making. The superior efficiency of the army is, we think, to be attributed in great measure to the improvements which have been effected of late years in the moral state of the classes from whom the army is derived, and to the more humane and just administration of the army itself. We have here a proof that soldiers may be educated, that libraries may be introduced among them, and that the degrading class of their punishments may be nearly done away with, without their being in any degree deteriorated. On the contrary, an improvement appears in that steadiness and fortitude which constitutes their value as soldiers. It is hardly necessary to remark that, if we are right in connecting these circumstances as cause and effect, they possess a deep interest, and ought to weigh much with the public.

THE STRIKES.

The building trades in the heart of western England have lately been holding out for an advance of wages—in one instance, we observe, the object was to rise from 25s. to 27s. a-week; and 26s. was in vain offered by the masters. A strike is nothing, unless there be a force of public opinion on the part of the operatives of the trade generally, to prevent strangers coming in and doing the work. This requires an enginery to rouse it and keep it up. Sometimes the force employed is a little more than moral. One way and another, a strike becomes a deplorable scene—men going idle for weeks or months, supported by subsidies from their own hard-tasked class—masters writhing in anger at the derangement of their engagements, and what they call the dictatorial spirit of those usually their servants. On this occasion, the masters have deemed it necessary to form combinations too, with a view to protecting their interests for the future against such inconveniences. In short, a strike such as this of the building trades is a war without actual weapons—we can barely say without its killed and wounded, for many must suffer what perils health and life in the course of these struggles. Some by-considerations make the trade-conflict the more distressing; the wages refused in this instance were comparatively not bad (alas! from three to four times those of a Dorset labourer). What causes more to be asked at all, is not an increase of business in the fair course of things, but a mania of speculation, in which we see multitudes of the middle classes seeking to enrich themselves otherwise than by the usual legitimate mode of honest, downright work. A madness of the capitalled in the first place—then the labourer attacking them with a claim upon their fallacious hopes, the blight of which may come to-morrow, throwing wages thirty per cent. down at one blow. What a vexation to think that our civilisation has only as yet brought us to such a point as this!

We cannot help thinking that these and other late circumstances tell that the present arrangements between employers and employed are assuming an impracticable character. They begin to appear like something which has had its day, and calls for being superseded. We do not at least see how capital is long to endure being exposed to the insecurity in which it now stands, wherever its profitable working requires a multitude of hands. A far-looking philosopher might also express his doubt whether the tendency of capital and labour, when in different hands, to separate the persons, can much longer subsist in an age when so many influences are at work to bring men to an equality, and when, indeed, artificial distinctions may be said to be crumbling to pieces. For such reasons, we indulge no empty bewailings on this subject; we think not of presenting to men in hot blood the barren maxim, that they have a common interest, and ought to agree. We deem it better to acknowledge that, for evils so profound, no superficial remedy will more than temporarily suffice. We would have masters to begin to turn their thoughts to arrangements of a different kind with their men—arrangements such as those of M. Leclaire of Paris*—in which the workers have a certain modified community of interest with the directors of their industry. It will be a startling and perhaps unpleasant idea at first; but is the present arrangement quite an agreeable one? What is now to be done is to obtain an escape from existing evils—to face one of the inevitable revolutions of society. It must not therefore be expected that all can be smooth and inviting in the new plans. This, however, we thoroughly believe, that were these looked at steadily, and experimented upon with due caution, in the departments of work where they are most pressingly called for, the objections would diminish at every step.

THE ABERDEEN SCHOOLS OF INDUSTRY.

A parcel of printed reports which has just reached us from Aberdeen, conveys the pleasing intelligence that the Schools of Industry established in that town for the suppression of juvenile mendicancy and crime continue to be in a flourishing state. Of these schools we gave a detailed account, from personal observation, in No. 98 of the Journal, New Series, published in the course of November last. It is very gratifying to know that the notice we speak of has had the effect of attracting a greater degree of local attention to these useful institutions, and of inspiring a desire elsewhere to establish schools on a similar plan, and for a similar purpose.† In the whole course of our labours, we have experienced no higher satisfaction than that which has been derived from repeated announcements of the practical value of that little article. A new satisfaction arises from a perusal of the reports before us. The system, we are told, is working well, and beginning to exercise a marked influence over the statistics of vagrancy, crime, and penal infliction.

The object of these schools, as may be remembered, is to prevent begging and crime by children—vagrancy or begging being observedly a mere preliminary to theft, theft leading to burglary or higher offences, and all these crimes sooner or later terminating in imprisonment, transportation, or penal inflictions still more severe. The aim, then, of these institutions is to prevent crime, instead of waiting till it needs to be

* Described with great care, from M. Leclaire's pamphlet, in No. 91 of present series of the Journal.

† 'In October last, Mr William Chambers came to Aberdeen to inspect the Schools of Industry; and in the number of Chambers's Edinburgh Journal for November following there appeared an account of his visit. Till that time, the Aberdeen Schools of Industry were scarcely known beyond the localities of Guestrow and Loch Street, where they are situated. Now, since the publication of that number, a knowledge of them is extended to every place where the English language is read; and one consequence of this publicity was the adoption of measures, now about to be carried out, by the citizens of Edinburgh and Glasgow for establishing schools there on a similar principle.'—*Fifth Report by the Committee of Management of the Aberdeen School of Industry for Boys, for* 1845-6.

punished. The way they go to work, consists in the seizure of every boy or girl found begging or vagrandising within the limits of the police, and conducting them, not to jail, but to a School of Industry, where they are fed, instructed, and caused to work at an easy kind of productive employment. All are sent home at night; but after a little time, the whole attend daily without any compulsion. By this means the streets are effectually cleared of all juvenile beggars and petty offenders. The crop of thieves is cut off ere it attains maturity. Crime is effectually nipped in the bud. From the report of the rural police committee of Aberdeenshire, laid before the commissioners of supply, April 30, it appears that the benefit of the schools is extended over all parts of the adjoining district. A few years ago, the number of juvenile vagrants which infested the county of Aberdeen was between 300 and 400. It was quite common to take up above 300 in the year. In the year, however, ending April 1845, the number had diminished to 105; and in the year ending April 1846, it had sunk to 14. To the activity of the police is, doubtless, owing some of this remarkable diminution; but further, observes the committee, is it owing to 'the establishment of the admirable Schools of Industry in Aberdeen—food and education having been provided for this unfortunate class, and thus even the shadow of an excuse has been taken away for sending out children to procure subsistence by begging. Your committee desire to draw particular attention to this subject, feeling it to be of the highest importance, because juvenile vagrancy is, they are persuaded, the nursery whence a large proportion both of the crime and the pauperism of after-years is furnished. Doubtless the Schools of Industry more immediately benefit the city of Aberdeen; but as it was from Aberdeen that most of the juvenile vagrants in the county issued, so now the county also is sharing largely in the benefit of these institutions.'

Whatever be the merits of the various plans now before the public in respect to the punishment and treatment of criminals, it can admit of no question that institutions such as those we allude to may be rendered important national engines for the general prevention of crime. What can be more sorrowful than the sight of a prison half filled with children, who, having once got into a course of vice, are almost certain not to stop till they endure the higher penalties of the law. That properly-organised Schools of Industry will tend to assuage, if not nearly extirpate, this crying evil, the best evidence is obtained from the reports before us. Let every large town, then, follow the example which has been so admirably set. Let the metropolis, always behind in movements for social advancement, be up and doing in this good work. Already the subject has been sufficiently talked about; the time has come for action. To set about anything of the sort, a little energy on the part of a single influential individual is alone required. In each locality, such an individual will know where to look for funds. He will not wait, and wait, and wait to see if government will lend its helping hand. Government seems to know or care little for first principles, and, besides, has neither power nor inclination to assist in any scheme of this broad and humanising nature. In establishing Industrial Schools, however, for pauper children, the co-operation of the local magistracy and police is extremely desirable: compulsion being a primary means of filling the benches with pupils. It would further be desirable to have a piece of ground in connection with each school, which could be cultivated by the boys able for garden or field labour. Valuable as employment within doors may be, it is much less exhilarating than that in the open air, where the whole influences of nature contribute not only to physical, but also moral improvement. The returns from any species of field labour, we apprehend, would also aid materially in supporting the establishment, and render it less burdensome to the friends by whom it would, in the first place, be maintained.

MERIT AND ITS REWARDS.

The newspapers announce that Jenny Lind, a singer, is going to St Petersburg, on promise of a salary of fifty thousand francs (L.2000) per month. Thomas Carlyle, who writes books that set mankind a-thinking, lives in an obscure house at Chelsea, not realising perhaps L.500 a-year by his writings. Fanny Ellsler, a dancer, a few weeks ago concluded an engagement at Venice amidst a shower of *flowers and jewels*, and then had a Cleopatra-like sail on the Grand Canal, with twenty bargefuls of nobility after her, while 'Long live Fanny, the divine artist!' was shouted from the multitude. At the very same time Mr Wilderspin, who has conferred inestimable benefits on mankind by the establishment of infant schools, is announced as sinking into poverty, and in need of a subscription for his relief. A child, called General Tom Thumb, passed through England and other countries of western Europe in 1844–5, realising large sums for his exhibition as a dwarf; the receipts in Edinburgh were, if we recollect rightly, four hundred pounds in one day. At the same time Father Mathew, who has produced, by the labour of a great and good mind, a moral reform unexampled in our age, languished in debt incurred through these exertions, and was only saved from immediate difficulty (not, as we understand, placed in permanent safety) by a collection, hard-wrung, as such collections usually are, from a limited number of persons endowed with an extra share of benevolence, the mass of the public as usual looking calmly on, with their hands in their breeches-pockets. During the same period many men of no particular talent or merit realised fortunes by speculating in the oversanguine hopes of their fellow-creatures—that is to say, in railway schemes. One man was talked of as having made his twenty thousand pounds—another, fifty—a third a hundred; and there were one or two peculiarly lucky, who bought ducal estates with their gains. While this was going on, the public of England were quite content to see the man who, by bold and ingenious calculations and extraordinary energy and perseverance, had given them the unspeakable convenience of penny postage, sit quietly down with a few thousands by way of reward, squeezed as usual out of the over-taxed pockets of the liberal. Everywhere the same inequality is seen. Who are the best-paid authors? Not the demonstrators of important truths, the investigators of profound critical and archæological questions, the compilators of huge books, that require a lifetime to complete, and on whose usefulness mankind batten ever after; not any of these, but the clever droll fellows who can set forth something to amuse their fellow-citizens—the Linds and Ellslers of the pen. What are the money-makers generally, in comparison with those who make no money? Not the shadow of an attempt would now be made to show that, in our economy, there is the slightest relation of proportion between large receipts and merits. It were a mockery of the stand-still principle to ask if such things are to mark our social state for many more ages. It is, however, some consolation in the meantime, that 'Man does not live by bread alone.'

CONTRASTS TO CIVILISATION.

The enormities that may co-exist with a high civilisation, sometimes come upon us with an astounding effect. In March of this year, a witness at an Irish assizes—who admitted having been concerned in five murders and many robberies—being asked if he would have murdered another man if he had got into his room, turned a ferocious look upon the interrogating counsel, and answered in a loud and resolute voice, 'I would!' More recently, it was found, at Ballichmoyler petty sessions, that a man had been *employed* to commit a murder for six pounds!

This is our contrast to the British civilisation.

As to the American—which, with all drawbacks, is a great civilisation too—see such incidents as the following.

A respectable black man, who had once been a slave in Kentucky, but was allowed by his mistress, who had no use for him, to go to work for his own subsistence in Ohio (a free state), where he had been for about eighteen years, and seems to have regarded himself as a freeman, was, on the 27th of March last, inveigled across a bridge into the slave-holding state, and there manacled and carried off by force. This outrage was committed at the instance of the old lady's heirs, who wished to realise everything in the shape of property to which, through her, they could consider themselves as having any claim. Some weeks after this, a female slave was hanged at New Orleans for having struck her mistress!

LIVONIAN TALES.

THE last *part* of Mr Murray's Home and Colonial Library was a group of *Livonian Tales*, by the author of 'Letters from the Baltic.' Before speaking of this particular book, we would record our satisfaction with the general character of the series to which it belongs. Darwin's Voyage of a Naturalist—Lord Mahon's Life of Condé—Borrow's Gipsies in Spain—are the stars of the more recent portion of the series; but all are good. When we regard this 'Library'—first-rate books, all of them copyright, many of them quite new, at half-a-crown each; and further look to Messrs Chapman and Hall's Monthly Series, Mr Bonn's Standard Library, and Messrs Tilt and Bogue's European Library, all of which are composed of excellent books at similar prices, we cannot but congratulate the public on the revolution of which these are the symptoms. Publishers are now looking to the many, and not to the few, as was the case twenty years ago. There must consequently be a many to look to. Verily, rational readers must now be as ten to one of what they were.

The 'Letters from the Baltic'—so full of fresh, animated description, so thoughtful, yet so feminine—together with the consideration that the Baltic provinces of Russia are totally new ground to the English fiction-monger—gave us good expectations of the Livonian Tales. We expected to find them interesting from various causes, independent of skill in tale-telling; and they really are so, although in a great measure it is a painful interest which invests them. The fact is, that the author has to deal with the subjects of a heavily oppressive government, and a people whose social state is consequently wretched. Her hero and heroines—barely conceivable beings—move amongst the brutal instruments of a central tyranny and a popular mass whose only refuge from misery seems to be that hardened insensibility which makes man a beast. *The Jewess*, the tale second in point of length, illustrates the vexations arising from the severe taxing system of Russia, and the contraband trade to which it gives rise. *The Disponent*, which is the longest story, exhibits the local oppressions exercised by what we would call the factor or land-steward upon an estate. Both pictures are enough to make the blood boil. We lately heard of the peasantry of Galicia rising upon the gentry, and massacring them. It seemed a wild, unaccountable affair; but let the reader look over 'The Disponent,' and he will understand the whole matter at once. The fact is, that the selfishness of the superior class tramples on every good feeling in the lower, until the patience of even a brutified human nature is exhausted. Vengeance is then stored up, and it depends only on opportunity at what time it is to break forth. But how should it be otherwise? No humble class ever yet was unruly or sanguinary in fair circumstances. The fact of a gentry destroyed *en masse*, as was that of Galicia lately, demonstrates that due provocation had been given. Our difficulties with such subjects arise from our attention being suddenly drawn to the vengeful outbreak, while ignorant or inconsiderate of the ages of heartless insolence, extortion, and contumely which preceded it. The class truly entitled to think shame of all such affairs as this same massacre—or, to take a stronger instance, the violence of the French revolution—is the class which suffers by them.

We must not, however, distress our readers on this occasion by any sample of the miseries to which the Lettish peasantry are subject. Rather let us look to some of the brighter passages of the volume. The hero of 'The Disponent' is a noble young peasant called Mart, who has obtained the affections of a pretty young creature, Anno, previously sought by the *Disponent* himself, the steward on the estate, and a concentration of all possible bad qualities. The wedding has taken place, and they are driving home in the bridegroom's cart, amidst a procession of other carts, filled by the Brautwerber or best man, the Marshals, who are assistants to the best man, and other friends. There is a fine joyful, youthful feeling in the subsequent transactions. 'The Marshals were anxious to exercise their privileges—namely, that of making every other vehicle on the road turn off for them. The first they met were humble peasants like themselves, who were as willing to observe the custom as they were to exact it, and who drew off immediately to the side, and waved their caps as the party passed. A werst or two farther on, however, a private barouche was seen approaching—four spirited horses full in the middle of the road, as if they would run down all that opposed them—a long-bearded coachman on the box, as firm and immovable as the engine on a steam-carriage. Now was the time for asserting their rights! The Brautwerber—timid man!—was all for relinquishing them; but the Marshals had warmer blood in their veins. They knew well enough what it was to turn off for their haughty masters—to stick in the road-side mud, or struggle in the road-side drift, while the baron's carriage rolled by without yielding an inch—not to make the most of such a rare opportunity for retaliation. Pulling and chucking, therefore, at their little horses, which, from the force of habit, had already begun to turn their heads patiently aside, they drew them close together; and, supported immediately behind by Mart himself, who, in his turn, encouraged the procession to keep their places, they presented a firm phalanx. On came the four horses, sweeping along; the coachman started into life, shook the whip which hung upon his wrist, and discharged a mouthful of Russian oaths at the body. A concussion now seemed inevitable, when a broad good-humoured face leant forward from the barouche, saw the state of the case in a moment, and discharged a very similar volley at the coachman in return. The carriage instantly swerved to one side. This was quite enough. Every cap flew off, every face expanded, and there was not one of the party who would not have been willing to drive their carts into a ditch for that same good-humoured face another time.'

After a similar rencontre with the droschky of the Disponent, the party arrived in high spirits at Mart's little farm. 'The cart stopped at the low wide door, which was crowded with guests awaiting their arrival. The Marshals, elated with their late successes, were all on the alert to fulfil their parts. The gloves, suspended to the shafts, which are supposed to bring good-luck to whoever reaches them first, were eagerly snatched; the bride was lifted from the cart at one bound on to a sheepskin extended before the door, to signify that the way through life was henceforth to be soft to her feet—a type, alas! to which there is no reality, at least not under a Russian government; the Brautwerber strewed corn before her, in emblem that abundance was to follow her to her new home; and thus she was carried, in noisy triumph, over her husband's threshold. There, surrounded by the women who had remained behind, and propped in a rude high-backed chair, sat Liso, Mart's grandmother, ready to receive the new-comer.

'This was their first meeting, and the old dame threw a searching and a solemn glance on the slight girl, in whom she saw at once the maiden her grandson had wooed, the bride he had betrothed, and the wife he had married. Anno bent involuntarily before her; and not

a word was exchanged, as, slowly rising and coming forward, the old woman took a high stiff cap, made of white silk, and placed it on Anno's pretty head. Voices had been loud, and faces merry, but all were now hushed and serious; for this simple ceremony went to everybody's heart.

'The meeting between youth and age is at all times a touching sight and an impressive lesson, telling us what the one has been and the other must become. The very difference between them disposes the mind to reverse more than to compare—to put the aged back and the youthful forward. Anno's head trembled with girlish timidity, old Liso's shook with infirm age; yet both were only separated by that time which time itself would unite.

'When the cap had been slowly adjusted, the grandmother again gave a glance at Anno, and in a shrill distinct voice repeated this ancient form of words which belongs to the ceremony:—"Forget thy sleep—remember thy youth—love thy husband;" accompanying each sentence with a slight stroke of Anno's cheek. Then turning to Mart, "Ah, my son—my son! you are a good man. You have chosen a beautiful wife; I know she will be a happy one." Then addressing Anno, "He has been always good to an old grandmother; will he not be good to a young wife? I hope you are worthy of him!"

"Grandmother—*pai* (good) grandmother!" said Mart in a tone of expostulation; but Anno stood upright with modest self-possession, and taking Mart's great brown hand in hers, she kissed it with wifely reverence. Then going round to all her new relations and guests, she begged their affection, as is the custom, and kissed their hands—not even the Brautwerber's little puny boy of three years old was omitted. And Mart's eyes followed the movements of that new white cap with exultation, for he felt that the face beneath it must win all hearts. Finally, she patted old Karria Pois [Mart's dog], which sat gravely by the grandmother's side, looking on, and which lifted his broad forehead under the pressure of her hand, and raised his large gentle eyes to her with as affectionate a look of welcome as any she had received. Then, placing herself next Liso's chair, she quietly stooped for a little wooden footstool which had been pushed away, and placed it beneath the old woman's feet, as if, by this simple action, to show that her course of filial service was begun.

'In the estimation of most present, especially of the women, the placing of the cap was by far the most important ceremony that had occurred; and certainly Anno's own feelings inclined that way. She had listened to the exhortation at her betrothal with awe, and received the marriage benediction with wonder; but there was something more than both in the touch of that aged hand on her cheek, and in the pressure of the cap on her brow, which made her feel that now indeed she was a wife.'

A substantial meal was then served, and the guests dispersed for a while, only to assemble again at a later hour to renew the festivities. 'It was altogether a pretty scene. The sun had begun to decline from its long-held height in the heavens, and the sloping shadows of the trees fell over the long straight roof and low walls, and played and quivered among the crowd assembled at the door; which, with the bright costumes of the women, the dull coarse garments of the men, and the uncouth figures and faces of too many of them, together with the rough benches and tables, and picturesque wooden vessels scattered around, looked like some northern Ostade's village-feast.

'The Brautwerber now came forward, and taking a small parcel from his pocket, shook out what might at first sight have been safely taken for some variety of national flag, but which the ladies present instantly recognised to be the newest and most fashionable description of apron. Then diving for Anno, who was ensconced behind everybody else, he brought her forward, and with some pretended, and quite sufficient real awkwardness, succeeded in tying it up round her short but slender waist. Then the Marshals came up; each took a corner of the apron, and, examining it attentively, shook his head, and said, "This is not a good apron."

"What ails it?" inquired the Brautwerber.

"It's an old rag," they answered. "There's a hole in it."

"Perhaps this will mend it?" rejoined the Brautwerber, and threw in a silver half-rouble.

"That's a good beginning, but it will want more yet. Hold tight, Anno;" and they each threw in a silver coin, declaring that the hole was bigger than they had thought, and that it would take a good deal to stop it. Then the guests in turn drew near, and flung in their offerings, which fell heavy or light, according to the means of the giver. Long the little silver shower continued, while Anno stood and bent her head gracefully, and whispered, "*Olge tervis!*"—"Thank you!"—as each coin fell.

'The Marshals now again approached, and declared there were several more holes they had not observed at first—great ones—and again each cast a mite into the growing treasury. Their example was followed with increased alacrity. In vain Anno repeated, "*Olge tervis!*" and Mart interposed with "*Küll, küll; ea küll!*"—"Enough, enough; quite enough!"—the gifts continued. The fulness of the bride's apron is as much the test of the popularity of the bridegroom as of her own; and Mart's warm heart and strong arm had rendered too many services to his neighbours not to be requited on such an occasion as this, when all purse-strings are supposed to hang very loose.

'Nor were their donations confined to the coin of the realm. A hank of fine white wool was thrown in by one hand, and a bunch of shining flax by another; then a roll of stout homespun linen, and a piece of coarse woollen cloth, and ribbons, and woollen gloves, and a little bit of coarse lace, and various other articles of female use or luxury. Then a measure of fresh eggs was placed down on one side of her, and a small tub of salt butter, for winter luxury, at the other; and suddenly a new spinning-wheel appeared in front; and a crazy old basket, out of which peeped several chickens' heads; and lastly, a tottering calf was driven up, till Anno was fairly surrounded with objects of household wealth, and stood in the midst like the goddess of abundance. Then more and more was heaped upon the apron, till either the bride's arms or the apron-strings seemed in danger of giving way; and at last the Marshals pronounced it to be fairly mended, and not a hole more discernible.

'But now old Liso hobbled forward, and, with her wrinkled face lighted up with a cheerful, pleasant expression, turned to the Marshals, and told them they were young men, but still they were very blind; that even her old eyes could see another great hole, and one which only her offering could repair.

"Daughter," she said to Anno, "all your presents are very beautiful, and your neighbours have made you very rich; but there is nothing in all they have given you which can mend the holes of human life like this. The time may come when you have nothing left to you of all your worldly goods, but even then, with the blessing of the Lord, you shall find this enough." So saying, she drew forth a Lettish Testament, which looked as if it had had the care and wear of many a year, and laid it topmost on the heap.

'Now the apron was actually in danger, and how its contents were not all spilled, was really a wonder; for Anno's arms were in a moment round the old woman's neck; but Mart's ready hand had seized the load, and, untying it from Anno's waist, he stood holding it in her stead, and looked on with glistening eyes.'

All this appears to us eminently beautiful. We have room for only another characteristic scene, but it is of a very different complexion. In the midst of a severe winter of famine, and still more distressing vexations from the oppressor, Mart was one evening coming

home through the wood in his sledge, when he was beset by wolves. 'The track, deep between accumulations of high snow, gave only just sufficient width for the little horse and sledge. Mart's eyes were closed, and his senses heavy with weariness; nevertheless he soon began to be aware that the animal was quickening its pace unwontedly: again it jerked forward—quicker still—and a low neighing sound of terror effectually roused the drowsy man. He looked in front: all was as usual—a wild scanty forest, standing knee-deep in a bed of snow—the narrow trough of a track winding through it—here and there pyramids of snow, which showed the huge ant-hills of the country—the heavens bright—the earth white—not a living object but the horse before him. He looked behind: the scene was just the same—white snow and leafless trees, and a winding track; but close to the sledge were three dark gaunt animals, heavily galloping, and another was fast gaining behind. The jaws of the foremost, with the lowness of the sledge, were within reach of Mart's shoulder. He cared not for that; he knew that it was his horse they wanted *first;* and saw in an instant that all depended on the animal's courage more than on his own. If the frightened creature could have the nerve to keep steady in the track, the chances were much in its favour; for the moment the wolves turned off, in order to pass and get ahead of it, the depth of the snow diminished their speed: but should the horse, in its terror, plunge aside and flounder in the snow, Mart knew that it would be lost. He leaned forward, called the animal cheerfully by its name, and laid his hand on its back as he was often wont to do in times of fatigue or difficulty; the poor beast knew the kind voice and hand, raised its ears, which were laid flat back with terror, and fell into an evener pace.

'Mart shouted violently; but the wolves were either too keen or too many—it made no impression. It was an awful time both for master and horse. Mart kept his hand on the animal, while his eye watched the ferocious brutes, which were often within arm's length. He had a hatchet, which he always carried on these occasions, to chop the frozen fish; he felt for it, and grasped it in his hand, but forbore to use it; for the closer the wolves kept at the back of the sledge, the less were they seen by the horse. Every minute, however, one or more of them broke out of the track in the attempt to pass; and although they instantly lost footing in the snow, yet the unblinkered eyes of the little animal had caught sight of the dreaded foe, and a plunge forward made Mart turn his eyes with anxiety to see that it kept straight in the narrow track.

'One of the wolves was more than usually huge and long-limbed, and more than once it had contrived, in spite of the deep snow, to advance nearer abreast of the sledge than any of its companions. Upon this grim creature Mart more especially kept watch, and caught the green light which played from its eyeballs. It turned off again—the snow lay fleeter for a space—the wolf kept its footing—it gained, for their pace is enormous—the little horse's eye glared round at it. Mart withdrew his hand, wet with the animal's perspiration; the wolf was just beyond arm's reach, but he kept his hatchet in readiness. The horse was now in desperate gallop, and the wolf just abreast—it suddenly turned sharp towards it—now was Mart's time. He dealt a tremendous blow. The wolf avoided it, but stumbled in the snow, and in a moment was yards behind.

'The distance from home was now quickly shortening beneath the horse's hoofs, which continued to carry the sledge at full gallop, till the fear of an overturn became a source of fresh anxiety. Mart was quite aware by this time that these were no common lazy wolves he had to deal with, but sharp-set, determined brutes, to which man or beast would be alike welcome. These were not the animals to be deterred by the signs of man's dwelling, as is usually the case, and there was an ugly werst of wide open space between the outskirts of the forest and his house, which he looked to with real apprehension.

'They were now at the very edge of the wood—the road became opener—the wolves gained on each side—the horse bounded furiously forward; caught the sledge against the stump of a tree—it overturned—was swept away at a tremendous pace, and Mart was left alone in the snow. In a moment a heavy claw had slit the throat, and down the front of his sheepskin: it was well Anno's wrappers lay so thick beneath. He threw off the brute, and rose. His hatchet had been jerked out of his hand in the fall: he cast a desperate glance around, but saw it not. The horse was now almost out of sight; two of the wolves were close to the defenceless man; and the two others, deserting the animal, were bounding back to him. Mart faced the foremost; he could do no more; and in an instant was surrounded.'

The arrival of the horse roused the women, and the moment the door was opened Karria Pois rushed forth, led by his kindly instinct. Anno flew wildly after him. To resume the narrative: Mart 'knew what it was to put forth his strength in games and wrestling-matches, and it was such as, shoulder to shoulder, and muscle to muscle, few could withstand. But it was as nothing now against the heavy weight, the vice-like teeth, the rending grasp that held him down on every side. For a few seconds the desperate violence of a man to whom life is sweet, and such a death most horrible, shook off the pitiless assailants; but his own blood had dyed the snow, and the sight of it seemed to turn ferocity into fury. The bloodhounds closed again upon him—they pulled him down!

'People say there is no time to think in sudden dangers: they have never known one. There are more thoughts struck from the mind in one moment's collision with sudden and desperate peril than in days of fearless security. The sweets of this earth—the home that lay so near—the mystery of Heaven, swept over poor Mart's mind; nay, even particulars found time to intrude. He thought how Anno and Liso would watch through the night—how his mangled remains would tell all in the morning—Anno's despair—the village lament. He thought of all this, and more, and knew himself in the jaws of hungry wolves! Then those foul lurid eyes glared over him; the tightening of the throat followed, and thinking was over. Still he struggled to release his arms—the grasp on the throat was suffocating him—his senses reeled—when, on a sudden, dash came another animal hard-breathing along; threw itself into the midst with one sharp howl, and fastened upon the chief assailant. The wolves relaxed their fury for an instant; Mart reeled giddily to his feet, and recognised his brave dog. For a second he stood stunned and bewildered; when he saw one wolf retreating, and all three attacking the dauntless Karria Pois. He turned to help him, and a bright object caught his eye; it was his hatchet lying on the snow within arm's length of his last struggle. Mart snatched it up, and was now himself again. Blood was dripping from him, but his limbs were uninjured, and furious were the strokes he dealt.

'One wolf soon lay dead at his feet; the other cowed and retreated, spilling its blood as it went, and held off, skulking round; and now Mart poured his whole fury on the great monster which held Karria Pois in as stifling a grasp as he had done his master. It was no easy task to release the dog. The hatchet rung on the wolf's skull, rattled on his ribs, and laid bare the gaunt backbone; but the dog's own body interrupted any mortal wound, and the wolf seemed to feel no other. Poor Karria Pois's case was desperate; his legs were all drawn together, protecting the very parts he sought to wound, when suddenly he stretched himself out with some fresh agony, and the hatchet was buried deep in the wolf's throat. Many more fierce strokes were needed before life was extinct; and as Mart rose, a hand on his shoulder startled him, and his wife fell on his bosom.

"Mart!"

"Anno!"

'Long did the young couple stand in speechless embrace; but the weaker supported the stronger; for Mart's manly nerve was gone, and he leant on Anno like a strengthless child.'

We challenge but one point in the taste and feeling of this book—the frequent intrusion of the author's religious views. The appearance, in a fiction, of any strong bent of mind on the part of the author, always has a pedantic and unpleasant effect; but it is peculiarly disagreeable in this instance, as our author's religious feelings happen to be of a somewhat intolerant kind, and her notions of the Divine government of the world far below the standard of what constitutes now-a-days a very respectable degree of orthodoxy. We might pass so doubtful an opinion, as that the peasant's superstition forbidding him to kill a wolf is a better feeling than the love of gain, which is tempted to do so by a reward from the government. But when we find almost every minute circumstance of an alleviatory kind in the lives of this poor peasantry represented as an immediate result of prayer; when we find the accidental death of the disponent, *after* a winter of horrors, and the suicide of one of the sufferers, attributed to an interference of God; when we find the existence of carnivorous animals ascribed to the existence of sin, all rationality is outraged, and we only can wonder that a really clever and highly-educated person can, in this country, contrive to be in a state of ignorance so profound.

THE PICTURE GALLERY AT DULWICH.

Your business, reader (and we speak to those who make pleasure their business, as well as to those whose time is occupied with graver matter), will not take it amiss if you leave that smoky bustling city of London for one afternoon this summer, and betake yourself to the little village of Dulwich, some four or five miles south of the centre of civilisation—St Paul's. There you may solace yourself with one of those collections of canvas upon which the painters have spread their magic colours for the admiration and delight of all countries and all times. You will find about 360 pictures well-housed and well-hung, of which some are worthless in every point of view, and some are for the study of the artist merely, while others are exquisite gems of art. The collection is freely open to the public every day during the week except Friday, but the visitor must take care to procure tickets in London. Most of the respectable printsellers have them to distribute, and they are to be had for the asking.

The history of the collection is somewhat curious. The following account we abridge from Mrs Jameson's 'Handbook to the Public Galleries in and near London;' a work which we cordially recommend to all who would improve their acquaintance with art. Towards the end of the last century, a Mr Noel Desenfans resided in England as consul to the last king of Poland, Stanislaus II. When the French Revolution threw a large number of estimable pictures into the market, he was employed by the king to purchase such of a superior class as could be obtained without paying extravagantly for them. The dethronement of the king took place after a considerable number of paintings had been got together for him; nevertheless Mr Desenfans went on collecting until Stanislaus died, when there was an end to all hope of remuneration from that quarter, and he found himself burdened with a gallery of pictures, in the purchase of which a large sum of money had been expended. The Emperor Paul of Russia, who obtained the greatest part of the Polish dominions, was then applied to; but before any answer was received, war broke out, and Desenfans determined to offer them for sale in England. A few of the best were sold, but the others remained in the collector's possession until his death, when he bequeathed them to Sir Francis Bourgeois, an artist of Swiss extraction, with whom he had early formed an intimate friendship. Sir Francis died in 1811, leaving the whole of his collection, numbering 354 pictures, to Dulwich college, for the use of the public, together with L.10,000 to erect and keep in repair a building for their reception, and L.2000 to provide for the care of the paintings. Sir John Soane designed a gallery of five rooms, lighted from above; and in 1812 the public were admitted for the first time. This is the gallery into which we usher our readers.

We are told of a dejected prince in one of Ford's plays, that what he took most delight in were 'handsome pictures.' Hazlitt, another sombre mind, has said, 'Pictures are scattered like stray gifts through the world, and while they remain, earth has yet a little gilding left, not quite rubbed out, dishonoured, and defaced.' If, then, paintings are capable of yielding pleasure to melancholy temperaments, much more are they calculated to impart enjoyment to those of cheerful constitution; that is, assuming that these latter have a relish for pictorial representations. If our readers have not yet been to the Dulwich Gallery, we intreat them to pay it an early visit, and we can promise them a rich treat. We will now precede them, and take the liberty of pointing out some of the works of art that seem to us most deserving attention. The paintings are placed on the walls without reference to school or subject. Only the size of the canvas has been attended to; and in a small gallery there is no objection to such an arrangement. In making the following remarks, however, we have thought it best to divide the paintings into four classes; namely, portraits, scriptural, landscapes, and miscellaneous.

Next to seeing a person with our own eyes as he lived and moved in flesh and blood, is the viewing his 'counterfeit presentment' by some cunning painter. Kings that laid down their sceptres before we were born, generals who are now as senseless as any of the corpses that strewed their battle-fields, beauties who bloomed long enough since to be the great-great-grandmammas of those that stood in that relation to ourselves, and the poets that celebrated, or might have celebrated, in flattering verse these ancient beauties, are still visible to us by the aid of 'this so potent art;' and we seem to know them all as well, nay better, than if they had lived in our time or we in theirs. It will help us to animate these mimic figures, if we consider that when this mixture of oil and pigment was distributed over the canvas, the living personages were actually present. They were then and there represented on the retina of the painter's eye whilst he transferred the image to the cloth; and now standing before his production, we may almost cheat ourselves into the notion that the man is yet alive, and we at liberty to read his features without reproof. Look at this portrait of a Spaniard, by a countryman (No. 309). How life-like, how nobly does Philip IV. stand before us in his slashed and embroidered dress of scarlet, plumed hat, and truncheon! Could anything be more vivid to our senses, or more royal to our imagination, than this work of Velasquez's pencil? Here, again, is another king (No. 2); he whom the French call their Great Monarch, and who is said to have been the handsomest man in his kingdom, as certainly he was one of the most profligate. This was that Louis XIV. who slaughtered thousands of men, merely to gratify his passion for what history has falsely called *glory*—who savagely sacked foreign cities, and then celebrated *Te Deums* in his own churches. Turn next to (No. 187) Marie de Medicis, the wife of another French king, Henry IV., who fell beneath a maniac's knife just when he was about setting off on a great war. This lady was of the famous Florentine family, by whose name she is generally known. Her son, Louis XIII., treated her cruelly, and she died in great poverty at Cologne in 1642. She was a patroness of Rubens, upon whom she called to feed her vanity, by procuring him to paint a series of pictures representing the principal events in her life. We must not forget that she was the mother of an English queen, Henrietta Maria, wife

of Charles I. No. 214 is an English nobleman, Philip, fourth Earl of Pembroke, whom Walpole calls 'that memorable simpleton'—usually styled, says Echard, 'the mad earl.' It is not one of Vandyke's finest paintings: there is a better one of the same person at Wilton, in which he is clad in armour. In this his plentiful hair is in disorder, and he is wrapped in a voluminous brown mantle. You would not gather his disgraceful history from his face, nor yet perhaps his noble lineage. He was the nephew of Sir Philip Sidney, and the son of a lady whose lot it was to have more honour showered upon her by the poets than probably ever fell on any damozell of ancient or modern times. Sir Philip dedicated his Arcadia to her; Spenser inscribed one of the sonnets which stand in the vestibule of the Faery Queen to her ladyship; and Ben Jonson wrote her epitaph. It was his brother William to whom Shakspeare is supposed to have addressed many of his mysterious sonnets. His second wife was that high-souled lady of the north, Anne Clifford, who has confessed, in her autobiography, that the marble pillars of Wilton were to her oftentimes but the gay arbours of anguish. A portrait of his first wife, a Vere of the Oxford family, hangs here (No. 134). She is habited in a rich attire, but perhaps it covered an aching heart. In looking over the portraits in a picture gallery, we often arrive at an interesting one which exhibits a person as to whose name the catalogue is silent. How strongly, in such cases, are we reminded of the couplet in the epistle addressed by a poet to a painter—

> Alas! how little from the grave we claim—
> Thou but preserv'st a face, and I a name!

Here is one of the finest portraits Vandyke ever painted (No. 218); rich in colour, beautifully finished, and as life-like as you can hope to see an image on canvas. Clad in armour elaborately ornamented with gold, his hand upon his sword, aristocratic in bearing, he is, after all, but 'a man of rank;' for as to more specific title, nothing certain is known. Yet we durst wager a small sum that he was one who acted in his day in some swelling scenes where a kingdom was the stage; and, by the malignant cunning of that swarthy countenance, we judge he had some enemies. Compare Lord Pembroke's picture with this, and you will see how variously the same hand could work. They are as different as prose and poetry. Turn we from those whose stage was a kingdom to those whose kingdom was on the stage. Here we have Mrs Siddons as the Tragic Muse, a celebrated painting of Sir Joshua. But, goodness! did the Muses, tragic or comic, ever wear those flounced and furbelowed dresses, or paste their hair up like that? We hope they never condescended, as sublunary actresses must, to wear our strange fashions. We can scarcely forbear smiling to see even an acted muse in an exploded mode (fancy Apollo in a wig and unmentionables); yet there is a majesty in the attitude and a fire in the eyes that ought to repress the weakness. Her distinguished brother, John Kemble, whom Sir Thomas Lawrence painted in Hamlet, is here represented by Sir William Beechey in his usual dress. The face is very capitally done; it is full of intelligence. We have also portraits of several painters. Sir Joshua Reynolds by himself, Wouvermans, Sir Francis Bourgeois (the public's benefactor), Opie, and others. Don't omit to look at this head by Lawrence. 'So pleasing and refined in the simplicity of nature, so true in the colouring, so careful in the execution, that perhaps few of Lawrence's more celebrated pictures might bear a comparison with it.' So says Mrs Jameson of a portrait of William Linley (not numbered in the catalogue), and all who see it must join in her praises. The delicious freshness of the English complexion (the envy of our continental neighbours) is most daintily represented. One more, and we have done with the portraits. It is a Painter's Mother by her son (No. 355). Rubens has placed the old lady in her arm-chair, and you see that she has been reading. It is a striking instance of Sir Peter's versatility of talent; one might think that his whole life had been employed in painting portraits. Lawrence himself could not have done the hands better. One of the most vivid portraits we ever saw is by Rubens. It represents a Dutch burgomaster, and hangs beside some of his splendid works in the gallery at Antwerp.

We are now in the farthest room of the gallery, and we shall be struck with the fine pictures on religious subjects which it contains. At the end of the room hangs 'the heavenly beauty' of Guido's St Sebastian. The saint lived in the persecuting times of the Emperor Dioclesian, and was condemned to be shot with arrows on account of his adherence to the true faith. Having undergone this cruel sentence, he was left for dead. Some Christian women passing by, found that life was not entirely extinct, and they succeeded in restoring him; but he was afterwards discovered, and suffered a second martyrdom by stoning. He is here represented of a life size, bound to a tree, with an arrow in his side. The expression of the countenance, upturned to the heavens, as if imploring relief from his anguish, is very grand. Another large work of the same painter is (No. 331) St John the Baptist preaching in the Wilderness. He is a young man, holding a slender crucifix in his right hand, and addressing persons in front, who are not seen. The colouring is thought to be not in Guido's best manner; nevertheless, it is a very fine painting. Close by is a picture of the Spanish school, of which we have so few specimens in this country: our Saviour, in mean attire, appears to bend under the weight of his cross, whilst some of those who had profited by his instruction are compelled to witness their great master's degradation with troubled countenances. 'The whole picture is conceived with great simplicity, and is full of grand and solemn feeling.' It may be contrasted on one side with an early specimen of the Italian school (No. 327), representing the Holy Family; and on the other with a later picture of the same school; the latter being a cardinal in the act of blessing a person kneeling before him. Both of these are excellent pictures; the second, by Paul Veronese, is uncommonly rich in colour. On the opposite wall of the room is a very famous painting by Murillo, representing the Virgin and her Son throned on clouds. It is usually known as the *Madonna del Rosario*. The rich glow of colour, as if the figures were illuminated by a beatific light 'that never was on land or sea,' the serenity of the mother's countenance, and the union of the divine and human natures in that of the infant, cannot be expressed in words. There is a little picture, by Carlo Dolci, of the *Mater Dolorosa*, a head, on which are white and black hoods, and then a crown of thorns. The delicate hues, the sweet expression, the transparent tear on the cheek, are exquisite; and we may say of it what Haydon has said of another picture, that 'it does not seem painted, but, as it were, spread upon the canvas by an angel's breath.' In the next room look at Nos. 277 and 287; they will give the visitor a tolerable notion of the manner of the Milanese school, of which Leonardo da Vinci was the head. It is ill represented in England, and that is one reason why we point to these two little pictures. There is an excellent specimen in the National Gallery—Christ disputing with the Doctors—attributed, but it is believed erroneously, to Leonardo himself; and there is a Holy Family, attributed to the same painter, in the Fitzwilliam Museum, Cambridge. No. 179, Jacob's Dream, by Rembrandt, is a picture that has excited much admiration. It is sublime beyond expression, says Haydon; and Hazlitt remarks that 'it is more like a dream than any other picture that ever was painted. The figure of Jacob himself is thrown in one corner of the picture like a bundle of clothes, while the angels hover above the darkness in the shape of airy wings.' Nos. 124 and 135 are two brilliant pictures by Vandyke, but they almost make us wish that he had let this kind of subject alone, and stuck to his portrait-painting, in which he has very

few rivals. The first, named Charity, is a beautiful female surrounded by children; and the other is a Madonna. Of both of them Vandyke painted several copies, to adorn the galleries of our nobility. These pictures catch the attention the moment you enter the room: the colours are harmoniously blended; the flesh tints highly natural and beautiful; yet there is a want of devotional feeling that ought to be there, some little affectation in the attitudes, and a modern, to-day look about both. Vandyke, like most painters since his time, could not or would not idealise his models. What was before him, he painted, and that excellently; but apparently he had not the power, equivalent to the dramatic power of the poet, of expressing the sublimer feelings of humanity, or of giving us a conception of a superior nature. We never see in his paintings the heavenly grace, the subdued gladness, the submissive grief of Raphael's madonnas and saints. He has never raised us into 'the privacy of glorious light,' to which Murillo, in his Madonna del Rosario, has reverently given us access. He has never shown us the pathetic countenance of a suffering, intreating saint, like Guido in his Sebastian. Amongst the landscapes, those by Cuyp are conspicuous, and there are several very good ones. He has been called the Dutch Claude. It is a pity there are here no undoubted, at any rate no good Italian Claudes to compare him with. He was fond of depicting a sunny afternoon; a long stretch of flat landscape, with church steeples and windmills here and there crossing the horizon; cattle, a few trees, and a piece of water: these are his favourite subjects, and he always contrives to represent them with such truth to nature, that notwithstanding his sameness of style, they are very delightful. Look at No. 169. The sun is on the point of setting, and the whole atmosphere seems saturated in a warm, rich light, like a sponge with water. Then cast your eyes on its near neighbour (No 163), which seems to us the finest Cuyp in the gallery, though some prefer the other one. How cool and clear the air, and how vividly are the shepherds, their flock and dog, the woman in the blue dress, and the man on his mule, depicted! Who does not wish that distant cottage under its sheltering hill were his?

'What loveller home could gentle fancy choose?'

In No. 239, we have another soft sunny evening admirably pictured; and the visitor may also look at Nos. 9, 83, 141, 192, and 243. Ruysdael paints in quite another style. Nos. 154, 241, and 245, will show that he prefers woods and sparkling waterfalls, and deep green foliage, to the airy openness of Cuyp. With these, Hobbima's pictures (Nos. 131 and 201) may be contrasted: a mill, some cottages and trees by the side of water, compose the first of these, which is painted in a clear style, and with a minute exactness, as if Canaletto had been trying his hand in the country. There are two pretty little landscapes of Jan Both, another Dutch painter (Nos. 199 and 205); and three Berghem's (Nos. 160, 200, and 209), a painter who showed a decided partiality for woody scenes. Wouvermans, so celebrated for his halts of travellers, hunting scenes, &c. has contributed several paintings, most of which have that eternal white horse which Wouvermans gives in as many characters as the high-mettled racer used to act in days gone by at Astley's amphitheatre. Nos. 93 and 228 are particularly fine: in both of them the white horse is doing duty in a cart. Pynacker has contributed two paintings (Nos. 130 and 150), the latter a small but striking work. A bridge is seen to cross a dark stream, and against the bright sky the figures of men and cattle upon the bridge stand out in bold relief. Beyond are

'Far off mountains turned into clouds.'

Two landscapes by Teniers should be inspected. No. 116, a winter scene, with preparations going on for an attack upon an unoffending animal; and (No. 139) a large landscape, in which his own château in Belgium is introduced. Watteau's pair of pictures (Nos. 197 and 200) should be glanced at as specimens of a style in which this painter had no equal—'a sort of French-Arcadian-pastoral-fantastic,' says Mrs Jameson, 'which never yet existed, in which nature is represented just as in a ballet. The nymphs, and swains, and "mincing Dryades" are all *très gentils*.' Our own Wilson's Ruins of the Villa of Mæcenas (No. 215) is the most celebrated painting that artist ever executed.

Some of the gems of the gallery yet remain to be noticed. There is a small painting by Jordaens (No. 37), which is said to be a study for a large picture in the Munich Gallery. The story of the traveller who excited the indignation of an unsophisticated satyr, his host, by blowing both hot and cold with the same mouth, is well told. Jordaens's pictures are all characterised by the deep red hue, which will be noticed here. No. 54 is an excellent representation, by Adrian Brouwer, of the interior of a low public-house. Brouwer was, unfortunately, too well acquainted with such a place; and he died, at an early age, a victim to his excesses. His paintings are much prized, as well for their intrinsic excellence as their rarity. This is the only specimen in a national collection. You must pardon us for drawing your attention to No. 66, a Bull, by Ommeganck. It is a small picture, and you will have to stoop to see it properly. It is a full-length profile of Mr Bull; and we are sure you will say he is an excellent fellow, standing there in a brown study. The Old Lady eating Porridge, by Gerard Douw (No. 85), is said to be a portrait of the artist's mother; and No. 106 is another example of Douw's extraordinary finish. In the same style are Adrian van Ostade's three pictures, Nos. 73, 107, and 190. By all means look at the last. A drinking scene of course: three boors are seated, in all the enjoyment of ease and ugliness, at a low table. One has a pipe in his mouth, another holds his glass in the air, and the soul of the third is manifestly in his fiddle. Mean as these subjects are, one cannot help being delighted with the spirit and beauty of the execution. Admitting the Dutch painters to be what Horace Walpole has termed them, 'the drudging mimics of nature's most uncomely coarsenesses,' it must in turn be conceded that the power put forth in exciting our interest is so much the greater in consequence of the meanness of the theme. Another instance may be seen in No. 132—a Farrier shoeing an Ass, by Berghem—where sheep, horses, &c. seem like real objects reflected on a mirror. Teniers, though a man who moved in the first society of his day, was another master in this low line, as may be perceived from Nos. 148 and 185. The latter represents a man cutting chaff (by hand—machinery had not then come into fashion) in front of a farm-house; and there are the expected accompaniments of such a place—poultry, pigs, horses, &c. Just turn your eyes to No. 229, the Farrier's Shop, by Du Jardin, and we will not afterwards trouble you with these 'uncomely coarsenesses.' A smith is busy shoeing an ox, which has its foot tied down to a stump of wood during the operation. How clear and soft are the hues with which this common scene has been depicted! The picture of a dark-haired, round-faced girl, in a white dress, leaning on a slab of stone, 'wonderful for mingled power and simplicity,' will strike you as being a Murillo. It certainly has much of that painter's style; but it is by Rembrandt, who, 'whether in portrait, landscape, or historical pictures,' says Haydon, 'was like nobody; as wonderful as any, and sometimes superior to all.' Now we come to the real Murillos, which have no doubt fascinated the visitor's eye long before this. What an exquisite painting is the Flower Girl (No. 248)! The full, rich, mellow colouring—the natural attitude—the sweet, gentle smile, that haunts one for many a day afterwards, and seems to say to all comers, Will you have these flowers? How memorable is the whole effect! Then, again, the two groups of boys given in Nos. 283 and 286. Here we have the same excellences (except perhaps the grace) which pervades the preceding picture. 'Murillo,' says Hazlitt, 'is probably at the head of that class of painters who have

treated subjects of common life. After making the colours on the canvas feel and think, the next best thing is to make them breathe and live. But there is, in Murillo's pictures of this kind, a look of real life, a cordial flow of native animal spirits, which we find nowhere else. The Spanish Beggar Boys, at Dulwich College, cannot easily be forgotten by those who have ever seen them.'

There are many other paintings in the gallery well worth an attentive perusal; but we are afraid our notices have already extended to a greater length than the reader's patience, and therefore we now cease to inflict our tediousness upon him.

MILITARY POLITENESS.

The most striking instance of military politeness on record, is probably an occurrence at the famous battle of Fontenoy, as related by Voltaire in his 'Siecle de Louis XV.' They (the English) were now about fifty yards distant. A regiment of English guards, those of Campbell, and the royal Scots, were the first; Sir James Campbell was their lieutenant-general, and Mr Churchill, the natural grandchild of the great Duke of Marlborough, their brigadier. The English officers saluted the French by pulling off their hats. The Count of Chabanne and the Duke de Biron, who were advanced, and all the officers of the French guards, returned them the salute. Lord Charles Hay, captain of the English guards, cried, 'Gentlemen of the French guards, fire!' The Count d'Auteroche, at that time lieutenant of the grenadiers, and afterwards captain, replied in a loud voice, 'Gentlemen, we never fire first—fire yourselves!' The English then gave them a running fire; that is to say, they fired in divisions. Nineteen officers of the guards fell by this single discharge; fifty-eight other officers, and 775 soldiers, killed or wounded: in fact 'the whole of the first rank were swept off. . . . The English advanced slowly, as if performing their exercise, the majors with their canes levelling the soldiers' guns to make them fire low and straight!' One is at a loss which to admire most—the politeness and urbanity of the bequeued, bepowdered, belaced, and beruffled officers on both sides, on the instant of destroying each other wholesale—the coolness of the men—or the imperturbable *sang froid* of the majors, who 'with their canes were levelling their soldiers' guns to make them fire low.' The whole, however, presents a picture of the glories of war—the *ultima ratio regum*, to which it would be difficult, in the whole range of history, to produce a parallel. It would almost compel our acquiescence with the assertion of a certain philosopher, that 'man is by nature a fighting animal.'—*Hood's Magazine.*

FEELING.

To feel is amiable; but to feel too keenly is injurious both to mind and body; and a habit of giving way to sensibility, which we should endeavour to *regulate*, though not *eradicate*, may end in a morbid weakness of mind, which may appear to romantic persons very gentle and very interesting, but will undoubtedly render its victims very useless in society. Our feelings were given us to excite to *action*, and when they end in themselves, they are impressed to no one good purpose that I know of. This is the chief reason why novels are so dangerous to young persons. My dear daughter will be persuaded that I say this from motives of the tenderest affection to her, and because I would have her not stifle the good and amiable emotions of her heart, but direct them rightly. I would not have my child become one of those of whom it may be said that they feel, and *only feel*. It is the most absurd and useless of all characters.—*Bishop Sandford.*

FRANCE AND ENGLAND.

We make no boast of Waterloo;
Its name excites no pride in us;
We have no hatred of the French,
No scorn of Yankee or of Russ.
The GLORY that our fathers gained
In bloody warfare years agone,
And which they talk of o'er their cups,
Gives us no joy to think upon.

In truth, we rather love the French,
And think our fathers did them wrong;
And sometimes blush when in the streets,
Quite out of date, an ancient song—
Ghost of a prejudice—comes back,
And tells us how, in days gone out,
The best of Englishmen was he
Who put a dozen French to rout.

We have no foolish thoughts like these
Of France or any other land;
And jealousies so poor and mean
We're somewhat slow to understand.
We'd rather with our friends, the French,
Encourage kindliness of thought,
Than gain a score of Waterloos,
Or any battle ever fought.

And in this year of 'forty-six,'
We rising men in life's young prime,
Are men who think the French have done
The world good service in their time.
And for their sakes, and for our own,
And freedom's sake o'er all the earth,
We'd rather let old feuds expire,
And cling to something better worth.

If thought of battles gained by us
Disturb or gall them, let it rest;
Napoleon was a man of men,
But neither wickedest nor best:
Neither a demon nor a god;
And if they will adore a king,
The honest man who rules them now
Deserves a little worshipping.

To be at strife, however just,
Has no attraction to our mind:
And as for nations fond of war,
We think them pests of humankind.
Still, if there *must* be rivalry
Betwixt us and the French, why, then
Let earth behold us, while we show
Which of the two are better men.

We'll try the rivalry of Arts,
Of Science, Learning, Freedom, Fame—
We'll try who first shall light the world
With Charity's divinest flame—
Who best shall elevate the poor,
And teach the wealthy to be true—
We want no rivalry of arms,
We want no boasts of Waterloo.

—*Daily News.* C. M.

NOTICE.

The Editors of the Journal do not undertake to return manuscripts sent to them, or to answer questions put to them, by strangers.

The present number of the Journal completes the fifth volume (new series), for which a title-page and index have been prepared, and may be had of the publishers and their agents.

END OF FIFTH VOLUME.

Printed and Published by W. and R. CHAMBERS, Edinburgh.
Sold by W. S. ORR, Amen Corner, London.

CHAMBERS'
EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF 'CHAMBERS'S INFORMATION FOR THE PEOPLE,' 'CHAMBERS'S EDUCATIONAL COURSE,' &c.

No. 131. New Series. SATURDAY, JULY 4, 1846. Price 1½d.

COMMERCIAL ESTIMATES OF HUMAN NATURE.

I was induced, after some persuasion, to accompany a fair friend the other day on what is called a 'shopping excursion'—a catastrophe which must happen to every married man once or twice in his life at least, if not oftener. We set out with the intention of purchasing a pair of gloves, some ribbon, and a yard or two of lace, and I believe this intention to have been, on both sides, perfectly sincere: positively, we were to get nothing more. Nevertheless, before our return, we had become the fortunate possessors of a shawl, a parasol, two ribbons, a half-dozen pairs of gloves, two pieces of lace, a summer dress, and a straw-bonnet. What more we might not have been cajoled into purchasing, had not the evening been closing in, 'tis utterly impossible to say. It was sometimes very amusing, at others as much exasperating, to witness the efforts made to induce us to purchase. Now the enemy would address himself to the lady's vanity, now to her curiosity, now to her economy, or then, as a *dernier resort*, to the gentleman's liberality. Thus, to select a short specimen of his tactics:—'Just suit a lady of your complexion, ma'am; quite *the lady's* dress, I assure you; perfectly new; completely uncommon: only observe the colours, ma'am!' as my wife sat, with semi-reluctant gaze, looking at a satin dress which she could not afford to purchase, thrown into folds with such art, as to reflect its brilliant colouring and silken sheen to the best advantage. Then, observing the pecuniary difficulty of the case—'Yes, ma'am, a handsome dress; perhaps a *little* more suited for the carriage than the promenade; but here, ma'am, something else; a decided bargain this is'—and the satin was carefully covered over to avoid the injury of a contrast with the homelier material—'pattern quite French, ma'am; part of a bankrupt's stock' (*sotto voce*) 'sold off at an awful sacrifice; not to be bought wholesale for twice the money, ma'am.' Or again, as we were about to leave—'Just received some curious parasols, ma'am; original one exhibited to her Majesty and Prince Albert; half-a-dozen ordered same pattern; your lady will like, perhaps, to see them, sir? New and remarkably ingenious mechanical contrivance for opening and shutting, sir. Her majesty couldn't make it out at all, ma'am.' Unhappy victims! we were both in the net; and while the cash-boy lagged behind with the change, one of the curious parasols and a shawl were transferred to our keeping.

The money was, after all, well-spent, for it set me a-thinking. So, then, there is a new way of viewing human nature. We may look at it through the medium of the commercial estimate. Poor human nature! It has become a perfect matter of business to calculate upon its frailties, to flatter its passions—even its evil passions—to excite its curiosity, to practise upon its credulity, to impose upon its good-nature, and sometimes even to call forth its better qualities—to such an extent has competition and the general struggle for subsistence sharpened the faculties of the present age. In many cases the commercial estimate formed of us is productive of nothing more than a few innocent schemes for our decoy, which our discernment penetrates, while our good-nature forgives; but, on the whole, it is scarcely too much to aver that this estimate is a derogatory one. It looks at man in an unfavourable and unpleasing light, giving him, except in rare instances, credit for a preponderance of evil over good, and regarding him rather as an enemy, to be assailed or circumvented, than as a relation and friend. Take us for all in all, I believe we are both better and wiser than our commercial estimates set us down as being.

Beginning with small things. We may exemplarise the effects of this estimate of one of human nature's infirmities—that of indolence. We were once parties to a grave discussion concerning shop-door steps, in which a young beginner was solemnly recommended not to adopt more than one step into his shop. People, it was said (that is, human nature), wouldn't take the trouble to mount up two or three steps, when, by going a little farther on, a more easily-accessible establishment might invite them in. There can be no doubt that upon a hinge as slight as even this, many a man's fortune or ill-fortune *has* swung. We may likewise observe how carefully this infirmity is studied in the widely-opened, easily-revolving doors of our modern shops. Be the winter's frost ever so sharp, or the cold wind ever so keen, it is a standing rule that the public entrance be never hindered by a closed door, or only upon the condition that some genteel porter, in white cravat and black livery, stands in continual readiness to bow in or bow out the purchasers. Thus, in the former event, some dozen shivering assistants are kept blowing their fingers' ends because poor human nature is believed to be too lazy to lift a latch, to turn a handle, or to open a door. Again, surely human natures who possess carriages must be believed to be unfortunately incapable of all other locomotion whatsoever, or we should never behold such spectacles as that of a bonnet-and-capless waiting-woman serving, on a chill winter's day, some of these unfortunates closely shut up in the aforesaid vehicles in the open street.

But to proceed to graver matters.

Oh, human nature is a dreadful hard-bargaining, screw-driving, profit-clipping thing at its commercial estimate! Nothing can be too cheap for it. One's blood boils as one after another of these kind estimators steps forward, and, as it were, clutching one by the hand, cries out, 'I'm the man for your money; I'm your only true friend; rest of the trade vagabonds and extor-

tioners! Here's my shop; everything at half-price!' Nothing but this estimate of man's moral *status* can account for the eye-teasing, heart-fretting announcements which glare from huge placards covering our metropolitan walls and boardings, like disease blotches, as they are, posted with such art, as to catch the unwary pedestrian at every turn, and fill his mind with the very natural imagination, that half the world must be in a state of utter ruin and insolvency, and that it was about to be sold off and done up for the exclusive benefit and satisfaction of the other half. 'Frightful sacrifices!' 'alarming bankruptcies!' 'awful conflagrations!' 'sudden deaths of proprietors!' (safely grinning behind counters), 'dissolutions of partnerships!' and such-like catastrophes of every-day occurrence, present one with a truly awful picture of the havoc which must constantly be going on in the world. Here, some Israelitish gentleman, with an excessive and completely unaccountable liberality, offers to clothe us from head to heel pretty nearly for next to nothing; so that actually one is led to parodise the Irishman's sentiment, that railway travelling was so rapid, that one could get a hundred miles off faster than staying at home; and to conceive that it is cheaper to apply to this gentleman than to do without the clothes one really does not want. There, some linen-draper, whose house rejoices in the *soubriquet* of Coburg-House, Gotha-Mart, or some similar classic cognomen, tells his fair customers, 'No reasonable offer refused!' and sends out, each morning of his life, a score of pallid, shabby copies of the human genus, bound up in parti-coloured boards, to move in melancholy procession adown and along our unhappy streets, announcing behind and before to all the world that no time is to be lost, seeing that things are being completely given away—information of the utmost value and consequence, if the same were worth accepting. Here the ticket-writer's art is exhausted in the emblazonment of vast extents of Bristol-board, intended to inform human nature, of every rank, that the open-hearted owner of some fast-going-to-the-dogs establishment is, on his retirement from business—what a complete cart-before-the-horse tale, seeing that business is rapidly retiring from him!—steadfastly purposed to distribute his valuable stock at less than the original cost. There, again, two opposition shops cut down one another's profits, reduce themselves to ruin, and do a lasting injury to all neighbouring trade, not to speak of the poisonous influence their example has excited upon the morality of the community, and all—looking to second causes—to gratify the propensities, and rejoice the heart, of human nature. No; human nature never thinks (this is the language of these degraders of our kind), as it looks upon a cheap shirt, or coat, or other article of wearing apparel, of the weary hand, the heavy eye, and the aching heart which wrought, and fagged, and starved thereon. No; for, in a too common commercial light, human nature is conceived to be a thing captivated at being profited by the ruin, the misery, the destitution, the calamities, and the sin of its fellow-creatures.

A moiety of the human family must, without a doubt, have been born possessed of only half the wits and acuteness to which man is entitled, leaving it a shocking prey to the superior attainments of the other half. What are the commercial records upon the subject? They are to be found in the thousand-and-one devices used to entrap and deceive. I am in the habit of passing a shop, situated in one of our greatest thoroughfares, where, to my certain knowledge, for upwards of a year and a half, bills have been placarded in every conceivable direction over its windows, glaring with continual falsehoods. At first it was, 'Selling off—removal of the business—immense discount off previous prices!' This answered very well for a month or two. Next, in vermilion type—cast, one would imagine, in the type-foundry of Brobdignag—long papers appeared with the welcome intelligence, 'Must be cleared in fourteen days!' Months have passed away since then, and the same succession of untruths appears in the windows; and the very house seems to hang its head in shame, and to feel that it is no longer fit company for respectable houses.

If we take up a newspaper, and direct our attention to its advertisements, we perusc a remarkable and instructive record of what is commercially thought of our astuteness and credulity. To glance at the quack medicine advertisements. We read of the most astonishing cures, and the most miraculous restorations, performed by the sole means and instrumentality of the puffed-off panacea. Here is one amazing remedy of Protean adaptation—capable of doing anything, or everything, or nothing, just as the case requires, so that, armed with a bottle of this corked-up longevity, or guarded by a box of solid immortality done up into pills, one might defy death for ever. There is the prolific bear's grease, which in less than a week covered a bald gentleman's shining head with a regular shock of hair, the old gentleman being obliged to procure a new hat in consequence. There is the mirific North Pole Balsam for baldness, or the South American Whisker Curler, or the Parisian Mustache Cultivator, each possessed of the same qualities, and in the same tremendous measure. Or maternal human nature is besought to take care of its hopeful progeny, particularly during the teeth-cutting stage of the progeny's existence; and, to secure lovely children in glorious health, is intreated to procure a five-shilling bottle of the real and only true Infant's Blessing. To incite maternal nature thereto, an attempt is made to awaken maternal solicitude by recounting the thrilling case of one unhappy baby which was dying—if, indeed, it had not died out of hand—surrounded by the faculty, and was restored to consciousness in five minutes by a tablespoonful of the Blessing: after six of the same, it began to cry; and after three bottles, was, to the endless glory and fame of the elixir, set on its legs again. Or, in another direction, we read of the disposal, by auction, under the hammer of a London auctioneer, of some dank, dismal, grim, tumble-down old mansion, agued by a slimy duck-pool in front, and by marshy meadows behind, and surrounded by soil scarcely worth turning over. But the eyes of an auctioneer are filled with phantasmagoric delusions; and after taking a survey of the enchanting spot, he returns to town, and, with an enthusiasm which can scarcely be regarded as otherwise than maniacal, attempts to cram human nature's throat with the most vivid and refreshing descriptions of scenery. Such luxurious turns of speech about the '*lac artificiel*' down to which the lawn leads, the excessively rural walks, the rich meadows, the rusty—I beg pardon—the rustic gates, and the Arcadian groves. Bright visions! realisable only in the conceptions of his deluded imagination, or in the effusions of his very poetic pen. Or from his metropolitan rostrum he may be heard pouring forth untruths by the round dozen; ready to protest, nay, busily protesting, new to be old, false to be true, copies to be originals, and using a quantity of the most outrageous hyperbole before a crowd of human natures, who neither believe what he says, nor give him the credit of believing it himself.

When we approach the moral estimate of human nature, as displayed in too many of the publications of this era, we enter upon a subject which demands a condemnation yet more severe, in the proportion in which it stands as a crime, affecting the best interests of our race.

The occurrence of an atrocious murder, or of some terrible crime, whose fearful enormity is the measure of the depths of iniquity to which man, when he separates from God, can fall, is the signal for the outpouring of nothing less than a torrent of printed sin. The most incredible pains are taken to collect every particular of the wretched being's life; no expense is spared to obtain the most minute details of the crime. With a frightful curiosity, the blood-bespattered wall, the dangling rope, the empty phial, are searched out and described; por-

traits of the murderer, of his weapon, and of the place where the act was committed, are faithfully executed; and a species of emulation is kindled as to which shall be the first public organ to bawl into the ears of mankind that another of their number has exceeded all the common bounds of error. How shocking and revolting an estimate of the taste of our fellow-men, even to conceive that any other sentiments than those of grief and shuddering abhorrence could occupy the mind on such a subject! Can language be found strong enough to condemn that sinful and sin-spreading estimate of our nature which would gift it with tastes better befitting the inhabitants of the pit of Acheron, than the human creatures of the world in which we live?

Enough upon a very painful subject. It may be said these estimates are taken from life; but this does not invalidate our position. Must man, if commercially estimated at all, be taken in his very worst light? What if there be thousands of whom these estimates may be, in a measure, correct? Are there not hundreds of thousands more to whom they are an insult, an injury, and a disgrace? And indeed it is worth the inquiry, whether, out of the many evil, there are not a few to be found whose natural bias, had it not received the injurious impulse of an evil estimate, would have been to the better side. It is to be feared it is true; and, if true, it is a very serious truth, that there are others than poets who 'create the taste of the age in which they live.'

It is pleasant to be able to turn to certain Commercial Estimates of Human Nature of a sounder kind. There is an allowable zeal in business, which leads men to study human nature in anything but a censurable manner. It is delightful to see a well-set-out shop-window, in which the goods and chattels are, with a pardonable view to captivate our taste, arranged in a completely *argumentum ad hominem* manner, if the phrase is tolerable. The only mischief which can accrue from such an estimate, may be the hungry water it is apt to create, where the looker-on possesses pockets and digestive organs in anything but a condition of repletion. At those periods of the year more particularly sacred to eating and drinking, it is a very impressive amusement to perambulate the streets of our great cities, and behold what a goodly estimate of human nature's capabilities in this line every shop-window affords us. Neither are we suffered to forget the poor; for coarse sheetings and blankets are to be found in many a window, modestly half-concealed in a corner, with a little written bill affixed to them, commencing with, 'To the charitable,' and ending with 'this inclement but festive season.' These, and many others, are kindly estimates of our common nature, which no one would dream of quarrelling with; and they are, indeed, not bad indications of a thriving and prosperous trade.

To take leave of a digressive subject. I should be sorry that any one who reads these pages should still think it a trifling matter either to form, or to be the subject of, an unworthy commercial estimate. A low estimate of human nature is a sentiment which will not, which indeed cannot, fail to produce distrust between the members of what should be a happy and confiding family; and nothing is to be regarded either in a trifling or pardonable light which has the remotest tendency to produce such an effect. It may be assumed that, while our social economy remains the same, and so long as man has commercial dealings with his fellow, human nature must necessarily be commercially estimated. Granting an assumption to be true which we might find it difficult to deny, let our end be to elevate the standard whereby we measure reciprocally ourselves and our fellow-creatures; be it an honest, worthy, kind-hearted one, not the sordid and debasing measure of this day. What can be conceived of as more likely to keep human nature bad and bare, nay, indeed, what more prone to make it so, than to believe it, or to act as if it was believed to be so? And what—putting for the moment out of the question other agencies—more probable than that love should engender love, and good faith inspire a corresponding good faith, not alone in our commercial, but in every other portion of our intercourse with mankind. If there were any doubt upon the subject, it is susceptible and suggestive of, in our age and country at least, a thousand practical answers in the affirmative, which will recur to the minds of our readers.

The subject of this paper is a peculiar feature in the every-day commercial transactions of the present age; it is one over which a too-jealous watch can scarcely be kept, for its manifest tendency is to loosen the bonds of mutual regard, and to humble man to a position inferior to his right one in the intellectual, and, above all, in the moral scale.

MILNER'S GALLERY OF NATURE.*—THE LOST AND VARIABLE STARS.

THE Gallery of Nature is a large and elegantly-presented combination of modern knowledge on the subjects of astronomy, physical geography, and geology, illustrated by numerous wood-engravings, and a few beautiful plates; the whole forming an extremely suitable manual for the young and self-educating. The utmost that a reviewer can do with such a massive work, is to test it in several places. This we have done, and the result is satisfactory. We everywhere find Mr Milner ample in his information, correct in his manner of stating it, and familiar with the most recent discoveries. He writes easily and agreeably, and occasionally relieves the matter in hand by playful anecdotes connected with the history of science. On the whole, it is a book highly creditable to all parties concerned.

After some chapters on the solar system, and a general one on the stars, our author comes to detail what is known regarding the 'New, Variable, and Compound Stars.' To this section of his book we shall confine ourselves. 'When we compare,' he says, 'the present appearance of the sidereal heavens with the records of former catalogues, some stars are not to be found now whose places have been registered. There are four in Hercules, four in Cancer, one in Perseus, one in Pisces, one in Hydra, one in Orion, and two in Berenice's Hair, which have apparently disappeared from the sky. It is no doubt probable that apparent losses have often arisen from mistaken entries; yet, in many instances, it is certain that there is no mistake in the observation or entry, and that stars have really been observed, and as really have disappeared. A star of the fifth magnitude, 55 Herculis, in the catalogue of Flamstead, was particularly observed by Herschel in 1781 and 1782; but nine years afterwards it was gone, nor has it since been seen. Sir John Herschel, in May 1828, missed a star in Virgo, inserted in Baron Zach's catalogue, and has never been able to perceive it. "There are now wanting in the heavens," Montanari observed in 1670, "two stars of the second magnitude, in the stern and yard of the ship Argo. I and others observed them in the year 1664, upon occasion of the comet that appeared that year. When they first disappeared, I know not; only I am sure that, on the 10th of April 1668, there was not the least glimpse of them to be seen."

'On the other hand, there are some stars now in the heavens which are supposed to have only recently become visible. No entry of them occurs in the catalogues of former observers, who have registered objects of inferior magnitude in their neighbourhood, and would not therefore have omitted these had they been present. Thus, a star in the head of Cepheus, one in Gemini, another in Equuleus, a fourth in Sextantis, a remarkable one between β and δ Hydræ, a sixth in Hercules, and several others, are not given in Flamstead's cata-

* The Gallery of Nature; a Pictorial and Descriptive Tour through Creation. By the Rev. Thomas Milner, M.A. London: W. S. Orr and Co. 1846. [Pp. 504, royal 8vo.]

logue. These are probably new, as that most accurate observer of the heavens could scarcely have omitted them.

'In addition to these changes, the occurrence of stars starting into temporary visibility, shining with great lustre, and then entirely vanishing, however unaccountable, is so well authenticated as to obtain a place in the class of unquestionable phenomena. An instance of this kind occurred in the year 389 of our era. In the neighbourhood of Altair, in the constellation Aquila, a star suddenly appeared, continuing as brilliant as Venus for three weeks. Other stellar apparitions are recorded in the years 945 and 1264; but the most memorable case occurred in 1572. [In this last instance] the new star, which glowed with great splendour, and continued visible for eighteen months, appeared in Cassiopeia, immediately under the scabellum, or chair of the Lady. It was first caught sight of at Wittemburg on August 6th, seen at Augsburg on the 7th, observed by Cornelius Gemma on November 9th, and by Tycho on the 11th. It formed an irregular square with three of the principal stars of the constellation, maintained the same position invariably with respect to them during the whole time of its apparition, exhibited no sensible parallax, which plainly declared its place to be in the region of the fixed stars.' Kepler also observed, in 1604, a remarkably brilliant new star, which appeared in the right foot of Serpentarius, and kept its place for a twelvemonth. * *

'There are now seven or eight well-attested cases of fixed stars suddenly glowing from out the sombre bosom of infinity, shining with great vivacity for an interval, so as to be visible even in the day-time through the intensity of their light, then gradually fading away, and becoming entirely extinct. We are completely foiled by these apparent temporary stellar creations. Are they worlds which, having accomplished one cycle of their existence, have had their physical structure dissolved by fire, to be remodelled? Are they thus bodies which have lain hid from terrestrial gaze by their remoteness, until some vast combustion has given them a transient visibility? * * We have choice of another theory, on many accounts preferable, though not free from great difficulties. It has been conjectured that the temporary appearance of stars may be resolvable into a periodical translation from the depths of infinite space, to a station which brings them within the bounds of our vision. Their sudden and brilliant burst from the dark and distant void, upon this supposition, arises from a tremendous velocity; and their evanescent stay within our view, may be caused by one of the narrow extremities of an orbit immensely elliptical lying in the direction of our system. It is further conceived, that the temporary stars of 945, 1264, and 1572 were not different individuals, but in reality the same star. This is grounded upon the close accordance of the intervals separating the periods.

From 945 to 1264, 319 years.	From 1264 to 1572, 308 years.

It has been supposed, therefore, that the star has an orbit which it accomplishes in about three hundred years. With reference to this hypothesis, it will be for the present century to utter a verdict. If it be true, those who live thirty or forty years longer will see the star upon which Tycho gazed in his manhood, and Kepler when a boy, return to its station in Cassiopeia, again to glitter, to wane, and vanish! In corroboration of this theory, it should be mentioned that the stars of 945, 1264, and 1572 appeared in the same part of the heavens. The chief difficulty which lies in the way of the supposition, that the temporary stars are objects moving in orbits which display them periodically to us, is, that no change of place has been observed during the whole time of apparition.'

We now come to the class of stars called *variable*, some of which periodically wax and wane in their amount of light, while others not only do so, but for a brief time become absolutely invisible. According to Mr Milner, 'The earliest observed example of this class is *o* Ceti, called also Stella Mira, or the Wonderful Star, situated in the neck of the Whale. It was first particularly remarked by Fabricius, August 13, 1596, when it appeared as a star of the third magnitude, but before the end of the year it had retreated entirely from observation. Holward remarked it again in 1637, after which it disappeared for nine months, when he again saw it. The following are now its general phases, which are gone through in 331 days 10 hours and 19 minutes. When at the greatest brightness, it is equal to a star of the second magnitude, and remains so for about a fortnight. It then decreases during three months, passes entirely out of sight, continues invisible about five months, again comes into view, increases during three months, when it attains once more its maximum lustre. It does not always, however, return to the same degree of brightness, or increase and diminish by the same gradations, or invariably remain invisible the same length of time. For the four years between 1672 and 1676, it was never seen at all, though Hevelius searched that part of the heavens diligently for it.

'Algol, the name of the star β in Perseus, in the head of Medusa, is another remarkable instance of stellar mutation. It varies from the second to the fourth degree of magnitude. This was determined by Maraldi in 1694; but Mr Goodricke of York, in 1782, and about the same time Palitzch, the Saxon farmer, first accurately fixed the period of its changes. The star goes through its variations in a remarkably short space of time: it continues at its brightest two days and fourteen hours. Then its splendour suddenly begins to diminish, and in three hours and a half it is reduced to its minimum. Its feeblest lustre lasts but little more than fifteen minutes. It then begins to increase, and in three hours and a half more it is restored to its usual brightness. Its full period is therefore 2 days 20 hours and 48 minutes. The remarkable law of variation to which this star is subject, suggested to Goodricke the idea of some opaque body revolving around it, which, interposing between the earth and the star, cuts off a portion of its light.

'χ Cygni was ascertained to be variable, and its period determined by Kirch in 1686. It changes from the sixth to the eleventh degree of magnitude, and consequently at its brightest is only visible to the naked eye under favourable circumstances. There are altogether about twenty stars ascertained to be variable, and upwards of fifty suspected to belong to the class.

'Various conjectures have been hazarded to account for these cases of periodic stellar change. If we suppose the varying brightness of the bodies in question to be caused by varying distance—the same hypothesis as that which has been mentioned in connexion with the temporary stars—it is singular that their position should be wholly unaltered during their respective changes. This appears fatal to the idea of orbital motion being the cause of their versatile appearance. Another surmise is, that dark bodies revolve around these stars, which, periodically intervening between them and us, temporarily cut off their light. Mr Goodricke proposed this theory respecting the star Algol; but it is open to the objection that it requires us to assign a magnitude to the revolving body in relation to that which must be deemed its primary, which is out of all proportion to that which we are led to believe belongs to dependent orbs. The subservient bodies in our system are immensely inferior to their primary—the sun—and owing to this, to a distant observer of our part of the universe, the transit of the mighty globe of Jupiter across the sun's disk would produce no perceptible effect. Our knowledge of planetary motion is also adverse to that rigorous uniformity which is so marked a feature of the stellar changes.

'It may appear a gratuitous assumption to take the solar system as a miniature picture of others; but we can only reason concerning what is unknown from what we know. Minute white specks appear in the

neighbourhood of the stars γ Hydræ, α Geminorum, and ε Ursæ, which in all likelihood are their encircling planets—tributary companions—plainly and vastly inferior, according to the analogy of subservient bodies in our system. Their intervention would have no perceptible effect upon the appearance of their primaries to our vision. The most probable hypothesis that has yet been proposed to account for the examples before us of stellar changeableness, is that of axical rotation. The variable stars are supposed to have parts of their surface less luminous than the rest, which, when presented to us in the course of rotation, produce the periodical decay of light and absolute invisibility observable. A variety of circumstances occur to favour this idea. Rotation upon an axis is a law to which every orb is subject with which we are sufficiently acquainted—as the sun, the planets, and their satellites. The greatest uniformity marks the execution of the law, and in this it differs from translation in space. The planets travel in irregular paths, and with varying velocities in their orbits; but their axical motion is uniform. If, therefore, one of the hemispheres of a rotating body within the sphere of vision should be less luminous than the other, periods of decay, obscurity, revival, and vivacity would be exhibited of uniform occurrence and duration. Now, those who have paid most attention to solar phenomena, are of opinion that, besides the sun having variable spots upon his disk—which at times have been so numerous and extensive as to impair his orb—there is reason to believe the illuminating power of his two hemispheres to be unequal, one being much fainter than the other. We may not be sensible of this, because comparatively situated in immediate vicinity to his effulgence; but, removed to a vast remoteness, his rotatory motion might constitute him sensibly a variable star to us. Herschel remarks, "The rotary motion of stars upon their axes is a capital feature in their resemblance to the sun. It appears to me now, that we cannot refuse to admit such a motion, and that, indeed, it may be as evidently proved as the diurnal motion of the earth. Dark spots, or large portions of the surface less luminous than the rest, turned alternately in certain directions, either towards or from us, will account for all the phenomena of periodical changes in the lustre of the stars so satisfactorily, that we certainly need not look out for any other cause."'

Another cause, nevertheless, has been suggested, and may be adverted to. It is thought that the stars may not be the central bodies liable to a partial obscuration by those circling round them, but themselves the circling bodies, and that it is round still larger central bodies *giving no light* that they revolve, in which case of course they would be eclipsed on passing behind their primary. The idea of such vast dark masses in the heavens is calculated powerfully to affect the imagination.

Mr Milner then comes to *multiple* stars—'a class unknown till a very recent date. Soon after the application of the telescope to the heavens, it was perceived that some of those brilliant points, which appear single stars to the naked eye, are in reality stellar combinations, comprising two or more individuals. Little attention, however, was paid to them, and no suspicion entertained of their numerical amount. It was reserved for the elder Herschel to detect the richness of the mine, and to take precedence in bringing some of its treasures to light. A catalogue of five hundred stars, apparently single, but in fact binary, was produced by this distinguished observer, and presented to the Royal Society; and when he ceased from his labours, his mantle fell upon successors worthy to receive it. The list of conjoined bodies, whose positions and relative distances have been accurately determined, now includes a number which is five or six times greater than that which appears in the general stellar catalogue of the ancient observers. Sir James South and Sir John Herschel produced a catalogue of 380 multiple stars in the year 1824, as the result of their joint labours. This was followed by one of 480 from South, and another of 3300 from Herschel—the fruits of solitary observation. M. Struve of Dorpat, also has registered the data of 3000. These are all included in the northern hemisphere, and within 15 degrees south of the equator. From the southern heavens an equally plenteous harvest may be gathered, of which Mr Dunlop's catalogue of 250, observed at Paramata, may be regarded as the first fruits. Upon the whole, the number of stars whose multiple character and respective positions have been determined, cannot be rated at less than 6000. Of these the most numerous are twin-stars, or binary systems.

'Of all the binary stars in the heavens, Castor is the largest and the finest, the one also which has been the longest observed. Its structure and position were recorded by Pound in 1718, by Bradley and Maskelyne in 1759, and by Herschel in 1799; and in the present day it has been closely and perseveringly examined by Sir John Herschel, Struve, and Sir James South. Castor is *a* Geminorum, one of the bright stars in the head of the Twins, the most northerly of the two, and is easily separated by a moderately good telescope. Its constituents are of the third and fourth magnitude, at present about 3 seconds apart. The pair now make an angle with Pollux, the other principal star in Gemini. But in Bradley's time the position was different, as appears from a memorandum of one of his observations:—"Double star Castor. No change of position of the two stars: the line joining them at all times of the year *parallel* to the line joining Castor and Pollux in the heavens seen by the naked eye." Sir John Herschel speaks of this object as that whose unequivocal angular motion first impressed on his father's mind a full conviction of the reality of his long-cherished views on the subject of the binary stars. α Coronæ, half-way between the Northern Crown and the club of Boötes, is a delicate double star, not to be seen but under favourable circumstances, requiring the most powerful and perfect instruments. Its compound character was discovered by Herschel in 1781, since which time its constituents have gone through more than a complete revolution, which renders it the most remarkable binary star known. Rigel, the well-known star in the foot of Orion, consists of one large and brilliant with a minute companion. The attendant point was seen by Herschel with a power of 227, but has been reached by one of Dollond's two-foot telescopes with a power of 70. Polaris, the pole star, is resolved into two of very unequal size, the smaller appearing a mere point in comparison with its companion. Mirac, or ε Boötis, about 10 degrees north-east of Arcturus, is one of the loveliest objects in the heavens, on account of the contrasted colours of the two stars composing it. It requires a power of 200 distinctly to define the pair. γ Leonis, about 7½ degrees north-east of Regulus, is another striking example of a double star.

'Besides stellar pairs, there are many instances of triple combination, of points apparently individual resolving into three distinct bodies when examined by an instrument of high power. An object of this kind is in the constellation Monoceros, or the Unicorn—a star in the left fore-foot, which is resolved at first into two; but one of these, on minute inspection, is found to be double. Herschel, who discovered this triplicate in 1781, pronounced it one of the most beautiful sights in the heavens. Eleven sets of bright triple stars, conjunctions of three bodies, are specified by Struve in a very small space of the heavens.

'Combinations of four stars, constituting a quadruple scheme, composed of two double, have also been detected. β Lyræ, π^2 Canis Majoris, 8 Lacertæ, and ε Lyræ are examples. The latter object the naked eye discerns as a star of the fourth magnitude, about 1½ degrees from Vega, upon the frame of the Lyre. With slight instrumental aid, it separates readily into two well-defined stars, distinctly apart, and each of these two becomes binary under a higher power. There are still

more extraordinary combinations than the preceding, or quintuple and sextuple stars. Thus θ Orionis, the trapezium, in the nebula, the first object upon which Herschel turned his mighty telescope, appears as a star of the third magnitude to the naked eye. It was so classed by Ptolemy and Tycho Brahe, but has long been known to be quadruple. Struve has, however, announced it to be quintuple; that is, when thoroughly examined, it consists of five constituent bodies so closely wedged as to appear an individual object.

'The phenomena of the multiple stars have already led to some interesting results. The Newtonian law of gravitation has, by their means, been opened to our view, operating in the far distant realms of the universe. When these proximate bodies were first discovered, it was not suspected that any physical connexion subsisted between them—any real contiguity. The proximity was supposed to be simply optical. It was imagined that one star lying at a remote distance behind another, and seen in nearly the same visual line, produced the appearance of a double star. In some instances this is undoubtedly the case; and, while the prevalence of the binary arrangement was limited to a few specimens, the solution was satisfactory. But the heavens are so thickly sprinkled with double stars, as to render it in the highest degree improbable that their occurrence is merely the accidental effect of two stars separated by a wide interval, lying out in space in the same direction. The argument adopted has been illustrated in the following manner. If we suppose a number of peas to be thrown at random on a chessboard, we should certainly expect to find them occupying irregular or random positions. If, contrary to this, they were, in far more than average numbers, found to be arranged in pairs on each square, the rational inference would be, that here there was no random scattering. The excessive prevalence of the binary arrangement would indicate forethought, design, and system.

'This is the reasoning of Dr Nichol, the force of which is obvious. Hence, when we find between the pole and 15 degrees south of the equator, 653 cases of conjunction, in which the bodies are not separated by the finest telescope from each other by more than the apparent diameter of Jupiter, and 612 cases of a lesser star associated with a greater, we are led to infer the real and designed proximity of these bodies. The principle now adverted to led Herschel to the conclusion that casual situations will not account for these multiplied phenomena; that, consequently, their existence must be owing to some general law of nature; and as the mutual gravitation of bodies toward each other is quite sufficient to account for the union of two stars, he felt authorised to ascribe such combinations to that principle. This reasoning has been emphatically confirmed by physical facts. The conclusion has been established beyond all doubt, that the multiple stars are made up of bodies in real association—physically connected. The constituents of a double star, closely watched through a series of years, are found to change their relative position, and to repeat the same cycle of change, indicating their systematic union under control of the law of gravitation. Here we have unquestionable signs of orbital motion, real binary systems of suns revolving around suns, the smaller around the greater, or both about a common centre of gravity. One has accomplished a complete revolution—ζ Coronæ—since observation was first directed to it; and, from the progress already made by others, their times of revolution have been estimated [in periods varying between 35 and 3077 years]. In consequence of revolution, the apparent distance between the constituents of a double star varies remarkably. Thus the two stars of γ Virginis have apparently approached each other, and have become so close as to present the appearance of a single star to the telescope, their respective motions again opening, as it were, a breach between them. The constituents of Castor now appear to be closing. "This star," says Sir John Herschel, "seems on the point of undergoing, within the ensuing twenty-four years, a remarkable change, similar to that of which γ Virginis has already furnished a striking instance during the last century, and passing from a distinct double star of the second class to a close one of the first, and ultimately to one of extreme closeness and difficulty, such as only the very finest telescopes, with all the improvements we may expect in them, will be capable of showing otherwise than single." We have thus seen suns in motion around each other—or around some intervening point, in the case of quadruple and quintuple stars—as decisively evidenced by observed phenomena, as the translation of the distant planets of our system around the central luminary. It required the most acute geometricians to resolve the well-known problem of three bodies, and it may be quite beyond our mathematics to determine the curves described by connected suns with attendant planets acting and reacting upon each other; but the fact of the stellar universe being the scene of activities—incessant, complex, yet nicely balanced and harmonised—is clearly before us.'

AN EASTER RAMBLE IN THE NETHERLANDS.

DEPARTURE—OSTEND—RAILWAY TRAVELLING IN BELGIUM—ARRIVAL AT ANTWERP.

'WHERE shall we pass our Easter holidays?' said a newly-married lady to her indulgent husband.

'Where,' exclaimed he, affecting an air of dissatisfied astonishment—'where can we be so happy as at home?'

'True,' replied the lady somewhat despondingly; 'but Easter, you know, is so universal a holiday, that everybody who can get away leaves town. Families of rank entertain "select parties" at their country seats; other people, who do not enjoy such good fortune, seek recreation in some favourite watering-place or suburban village; even the poorer artisans, who are too truly called "the working-classes," rejoicing in the consciousness of their liberty during the intermission of their labours, may be seen, in their best Sunday apparel, strolling into the parks and neighbouring fields, contented and happy. Indeed the knowledge and *sense* of there being a holiday among the people, excites in everybody's bosom a feeling of restlessness—a desire to go *somewhere;* just as birds on a fine sunny day appear to fly about merely for the pleasure of disporting their wings in the translucent atmosphere.'

'Quite true,' interposed another of the company; 'and it has always appeared to me that Easter ought to be held as a peculiar festival, not only upon religious principles, but because it happens at the most cheerful and most exhilarating season of the year, when every tree, and herb, and flower is budding into new life. It is true that we speak proverbially of "a merry Christmas" and a "happy New-Year;" but it is then wintry cold out of doors, and the gatherings of relatives and friends round the social fireside are too often saddened by some irreparable domestic bereavement. Nor are the incidents of the bygone year always, even in a worldly sense, matters for congratulation; but Easter arrives at no such critical epoch—makes no such sensible "pause upon the bridge of Time"—forces upon us no such painful retrospection. No; Easter brings with it only heart-stirring holiday associations: it steps forth always as the herald—but this year [1846], from the mildness of the past winter, more like the handmaiden—of Spring; and they who refuse to go out and welcome her approach, may well be accused of what Milton calls a "sullenness against nature."'

'Not unpoetically argued,' answered the husband; 'and if you like to make up a party for a short excursion, we will willingly join you; and supposing, instead of going to Brighton, or Worthing, or Ramsgate, we run down by the railway to Dover, cross over to Ostend, and pass our Easter holidays visiting leisurely some of the fine old towns in the Netherlands?'

'That would be delightful,' rejoined the young wife in an animated tone; 'more especially if you, who have so often explored their beauties and curiosities,' added she, addressing herself to me, 'would accompany us.'

'Be it so,' I replied. 'I will cheerfully act as your *cicerone*, or commissionaire, as this unlearned functionary is called in France and Belgium; and I would suggest that we at once determine upon witnessing the celebration of high mass at the cathedral of Antwerp on Easter Sunday.'

'Agreed—agreed!' was the consentaneous exclamation; and forthwith the preliminary arrangements were settled, and the following evening, with these three cheerful companions, I found myself in the railway train, once more hurrying along *en route* for the continent.

We steamed away with the usual railway speed; and upon reaching Dover, found, to our satisfaction, that a new government steamboat, named the Violet, was about to make the following morning her first—her maiden trip to Ostend. Our little party was therefore early on the alert, and at nine o'clock we were on board, steering steadily out of the harbour. The improvement in steam navigation is indeed wonderful. Only three years ago, we congratulated ourselves on making this very passage in eight hours; but we now found that the Violet cut—literally *cut*—through the water at the rate of fifteen miles an hour; and although we had a strong head-wind against us all the way, she reached her destination at a quarter past one o'clock—thus accomplishing the distance, which is sixty-five miles, in four hours and a quarter. The quay at Ostend was crowded, as usual, with a motley collection of people, among whom might be observed custom-house officers, porters, fishwomen, idle soldiers, and a host of hotel agents, who watch, like wreckers upon the coast of Cornwall, for the arrival of every steamer, for the purpose of pouncing upon the luckless passengers as they land. The predatory habits of this idle class of men may be easily accounted for by the simple fact, that the hotel-keepers for whom they cater pay them nothing—not even a commission on the custom they may apparently bring to the house. They are permitted to hang about the doors, and act ostensibly as the commissioners of the hotels, upon the understanding that this privilege will afford them sufficient opportunity for remunerating themselves, by obtaining whatever they can get from the visitors for looking after their passports, their luggage, and the next conveyance by which they may wish to proceed. They pursue no other occupation; they trust entirely to chance; and do not even live in the hotels for which they are apparently employed. And when the season, as it is technically called, is succeeded by winter, during which few passengers arrive, they have no other resource to fall back upon excepting what they may have laid aside during the harvest of their mendicity.

It appears curious that the hotel-keepers themselves do not employ trustworthy people of their own establishment to meet their customers upon landing, and perform whatever services might be required of them, for which they might make a fair and reasonable charge. This would put the matter upon a better principle; for commissioners in these foreign towns are to strangers a useful, and ought to be a more respectable, order of men. Immediately on our landing, they surrounded us, chattering like so many baboons in a most unearthly language—half Dutch, half French, half English—shouting out the names of the different hotels; and while the custom-house officers were quietly trundling off our baggage upon their trucks in one direction, these noisy myrmidons threatened to hurry us away bodily in another. The only way to get rid of their importunities is to name the hotel to which you go, upon which the commissioner who acts for it changes his tone, and steps civilly forward to your assistance, while his extortionate brethren withdraw. Upon reaching the portals of the custom-house, we were informed that everything must be deposited there, and remain in limbo until two o'clock. In small towns on the continent, between the hours of twelve and two, public business is suspended; and the few portmanteaus we had brought with us were therefore doomed to repose upon one of the custom-house benches—sympathising, we presume, with the siesta or noonday snooze of the authorities. It was some relief, however, to find that we were not troubled about, nor even asked to produce, our passports; for, in accordance with the spirit of the age—which seems to demand a free intercourse, personal and commercial, between all nations of the world—we found ourselves at liberty to land in Belgium without being subjected to the annoying delays and frivolous expenses which were entailed upon all passengers under the old passport system. Herein the Belgian government has set an example which, we may reasonably hope, will be followed by the king of Prussia as well as by the government of France; for in proportion as nations associate together, and amalgamate their interests, restrictive laws, tending to keep them asunder, must give way.

We soon ascertained that the next train from the Ostend station would not start in the direction of Brussels until half-past three o'clock, so that we had ample time to join the table d'hôte at the Hotel de la Cour Impériale, and afterwards look into the town. In all the principal hotels in Belgium there is a table d'hôte at two o'clock, and, during the season, another for the accommodation of visitors at four. But we have observed that, somehow or other, by a wonderful provision of nature, the appetite of English travellers can accommodate itself to all hours; so that those who cannot dine until the fashionable hour of six in London, contrive to make a hearty dinner about noonday when abroad. So fared it with us: and we would fain commemorate, although not professed epicures, one dish, which was to us a culinary novelty; namely, a boiled fowl, deluged *simpliciter* with shrimp sauce. Shade of Dr Kitchener, forgive us! And yet if salt calves' tongue or ham be a legitimate adjunct to boiled turkey or boiled fowl, why not the more delicate saline flavour of shrimp sauce? Try it, gentle reader, before you hazard an opinion.

After this early, albeit, as we have premised, satisfactory dinner, we strolled into the town, which has been sorely abused for its stupidity by all English authors. The theory by which the condemnation of these sea-coast towns—including Boulogne, Calais, and Dieppe—may be explained, we presume to be this: that these travelling malcontents arrive in them suffering generally under gastronomic irritation and depression from sea-sickness; their vision, as is well known to physiologists, is thus nervously affected, so that they see everything through a gloomy medium; and being anxious to pursue their journey—for English people, even those who have nothing to do, always travel in a hurry—they do not stay long enough to correct their prejudices, or form a just estimate of the place. The gay season of Ostend is during the summer and autumn months, when it is crowded principally by German visitors, who, from the facilities of the railway communication, find it a convenient, indeed the only sea-bathing place to which they can resort. It is then the long promenade, the Digue, which extends for a considerable distance along the sea-shore, and is curiously paved with little, narrow, Dutch tiles, and presents a scene of extreme gaiety, which is frequently enlivened by the presence of the king and queen of the Belgians, and their interesting family. The king, who is very popular, invariably resides for six or eight weeks at Ostend during the summer months. Here, as in other towns of Belgium, the Dutch fashion is adopted of placing two small looking-glasses outside the windows of the house, so adjusted as to reflect the passengers even at the distant end of the street; thus the mistress of the house sees, while she is at her embroidery, who is coming, and has plenty of time to give orders to her servants to admit or deny her to her dear

friends long before they have approached the threshold of her door. Others, over shops, are so adjusted as to reflect what is passing in them, so that the master, without troubling his clerks, may observe the customers at his counter. To the young traveller visiting the continent for the first time, the triangular apparatus in which these little mirrors are placed, projecting from the houses, has a curious effect; just as the forest of black boards which project from the second and third floor into the middle of the streets at Frankfort, from almost every house, bearing the name and trade of the occupant, struck us as very remarkable when we visited for the first time this 'imperial free town.'

We soon found the interval between our arrival and intended departure in continuation of our journey lessening; and having recovered our portmanteaus from the inquisitorial ordeal of the custom-house—which, we presume, will eventually share the fate of all other inquisitions, the laws of which are only preserved now as a matter of history—we took our seats as the signal-bell was ringing in one of the carriages of the *chemin de fer* or railway train, having provided ourselves with tickets for Antwerp. The management of the passengers' luggage is much better conducted here than it is in England. Upon arriving at the station, every person sees his baggage weighed, and pays by its weight according to the tariff; he is then given a *billet de reclamation*. The baggage is taken from him, and no matter how often he may be desired to change his place out of the carriage he first entered, he need not look after it, or give himself the slightest trouble, until he arrives at his destination, and then, upon presenting his ticket, it is restored to him, and the railway porters dispose of it as he may direct. How much better is this than the English system of allowing passengers to scramble after their own portmanteaus and carpet-bags, which it is often difficult to identify, for the simple reason that the trade is supplied with these articles by the same wholesale houses; and no wonder, therefore, that there should be so strong a family likeness between them as to lead to confusion. The Belgian railway, from Ostend to the Prussian frontier, runs along a highly-cultivated country, and the picturesque scenery on either side is not walled out of view by high embankments and deep cuttings. We might have fancied ourselves driving, as we passed rapidly onwards, through some English gentleman's estate; for the scenery was continually park-like, interspersed frequently with young plantations of fir, beech, and other trees; and in many places we observed orchards, with their apple-trees in full blossom, and neatly-trimmed gardens extending down to the very edge of the railway road. In some parts of the line, particularly near the Prussian frontier, the railway road is ornamentally enclosed with trees for many miles, just as an English carriage road between its hawthorn hedges.

We halted at a station about every twenty minutes, and were surprised at the number of people who, without bag or baggage, availed themselves of the convoy. However, from the priest in his black cassock and square-cornered hat, down to the field-labourer in his blue smock-frock, or *blouse*, as it is called, nobody seems to think in Belgium of any other mode of travelling. We also remarked the quiet and methodical manner in which the railway business, in every department, appeared to be conducted. We were not ever and anon startled by unaccountable shrill-piercing whistles from the engine-pipes, which thrill through our very bones, followed by shrieking agonies of escaping steam. The officers, too, at the different stations at which we stopped were observed walking about, and performing their duty in an orderly manner; whereas at the English stations they are seen running to and fro in every direction, and there is a shouting, and hallooing, and a slamming of doors, as if everything connected with a railway must be done with the greatest possible noise, hurry, and confusion. After passing Bloemandel—the Valley of Flowers—and Aeltre, we found, as we approached Ghent, the fields in every direction inundated by the late heavy rains. The overflowing of the Meuse had also, we were informed, done serious mischief. Upon leaving Ghent, the train turned round, as if into a back road, reversing the direction of our former course, so that the passengers who were before seated with their backs to the engine, found themselves facing it, and *vice versâ*, much to the annoyance of those who had been particular in the selection of their seats.

We now passed a number of towns and hamlets, the names of which it is not necessary to give, the scenery continuing all the way very picturesque until we reached Malines, the central station of all the railways in Belgium. Every railway throughout the kingdom meets at this point, so that the convergences of so many lines to this, which is the heart of the whole system, has a remarkable effect. The scene is curiously busy. A simultaneous arrival of trains is constantly taking place, and the number of people who alight from one convoy, and as rapidly disappear in another, is bewildering. The open arena before the station-house and the adjoining refreshment-rooms is one moment crowded with well-dressed people, of both sexes and all ages, who intermingle with each other in detached groups for a few seconds, and then stepping into their respective carriages, are the next moment hurried out of sight, leaving the place in comparative solitude. Yet in the midst of all this changing of carriages and concourse of people proceeding to different destinations, we did not observe any appearance of irregularity or confusion. We were detained at Malines half an hour, waiting for the train by which we were to proceed; and as the evening had already closed in upon us, we were glad when it arrived. Upon our arrival at Antwerp, a *vigilante* or hackney-carriage was immediately at our command, which landed us while the church bells were chiming eight o'clock at the Hotel du Parc in the Place Verte—an open space adorned with trees, through the shadows of which we discerned the statue of Rubens; and although a fine moonlight night might have tempted even more fatigued travellers to stroll out, we contented ourselves with the recollection that we had accomplished, in about eight hours, deducting the two principal stoppages, a journey of nearly a hundred and fifty-five miles;* and anticipating that we should receive much pleasure from our visit to this charming town, we retired at an early hour to rest.

POPE'S CORINNA.

Among the many persons of greater or less obscurity satirised in Pope's *Dunciad*, is a female author bearing the name of Corinna. She is introduced in a manner peculiarly opprobrious in connexion with the famous bookseller, Edmund Curll. The cause of her suffering in this manner was the concern she was believed to have had in surreptitiously giving to the world, in 1727, a small volume of juvenile letters by Pope. The letters were in her possession through circumstances in no respect dishonourable to her, though the contrary has been alleged. Pressed by poverty and the wheedling arts of Curll, she is said to have been induced to accept a small sum in order to allow of their being published—a transaction which, in the then doubtful state of all

* Distance from Dover to Ostend, 65 miles, performed in four hours and a quarter; distance from Ostend to Antwerp, 89½ miles, performed in four hours and a half. Total, eight hours and three-quarters; from which deduct stoppages, a quarter of an hour at Ghent, half an hour at Malines; and, without reckoning detention at other stations, the whole distance from Dover to Antwerp is thus accomplished in less than eight hours. If to this we add from London to Dover, 72 miles, which is always by railway, done in four hours, the whole distance from London to Antwerp may be accomplished in one day, always providing care be taken to reach Ostend in time for the half-past three o'clock train. The same convoy would conduct the traveller to Brussels by eight or half-past eight o'clock.

literary rights, implied much less culpability than a similar act would now do. Such was, at the worst, the real extent of the guilt of Corinna. If a true charge against her, it is not to be wholly excused, even under the plea of poverty. But when we learn that this was a woman who had passed honourably through many worse trials, and made many sad sacrifices, the charge becomes more than doubtful; and, whatever may be thought of it, we can little sympathise in the coarse and unmanly attack made upon her in that dreary record of literary irritability and malice—the Dunciad. We propose to give, from authentic sources within our reach, an account of the extraordinary history of this lady; partly because it is in itself a curious tale, and partly because it serves to show what a difference there may be between the reputation of a person in literary history, and the actual life and character of that person.

Corinna was but the assumed or title-page name of a lady who was by birth Elizabeth Thomas. She was a poetess, and, as such, is alluded to in commendatory terms by Dryden. In latter life she wrote many books, but never rose above the second class of authors, though she had all the generosity, tenderness, and delicacy, without which poetry is nothing. Her mother, when a beautiful girl of eighteen, had been given in marriage to a Mr Thomas, a man old enough to be her grandfather. His supposed wealth had been weighed against the sacrifice, and for a few years after their union he lived in great splendour, and then died, when Mrs Thomas was undeceived as to the state of his finances. She found herself in very straitened circumstances, which was the more keenly felt, as her darling child, who was just two years old, was of a delicate constitution, which made indulgence absolutely necessary. Immediately after her husband's death, Mrs Thomas parted with his town and his country house, and retired to the county of Surrey, where she took up her residence, as boarder, in the house of a cloth manufacturer. Though the lodgings were respectable, the society was ill suited to her; her host was illiterate, and his wife and family ignorant and vulgar. Her elegant appearance, however, attracted the notice of an intelligent physician, Dr Glysson, who saw her in church. He solicited her acquaintance, and she found his society a valuable acquisition. Though in his hundredth year, his memory was so tenacious and clear, his judgment so sound, and his spirits so cheerful, that he was a very delightful companion. In his person he was tall, his hair was white as snow, and his complexion was clear and blooming as that of early youth. He often visited her, and his pleasant conversation beguiled many a moment. On one visit which he made to her, she observed him drawing on a pair of 'rich Spanish leather gloves, embossed on the tops and backs with gold embroidery, and fringed round with gold.' Her curiosity was excited, and she asked the history of those gloves, which he seemed to touch with profound respect. 'I do respect them,' he answered; 'for the last time I had the honour of approaching my mistress, Queen Elizabeth, she pulled them from her own royal hands, saying, "Here, Glysson, wear them for my sake." I have done so with veneration, and I never drew them on but when I had a mind to honour those whom I visit, as I now do you: and since you love the memory of my royal mistress, take them and preserve them when I am gone.' He took his leave, never to see her more: he died in a few days. Mrs Thomas could not but regard this parting legacy with a feeling of deep melancholy, and she grieved much for one who had been to her so kind and courteous, and whose conversation had been at once so instructive and cheering.

There was not one in the domestic circle with whom she associated, with whom she could hold companionship. All that makes intercourse engaging—feelings, tastes, sympathies, and manners—were completely at variance. The family, however, were not slow in perceiving how solitary she appeared; and, being good-natured, and pitying her, they were anxious to see her in better spirits. They recommended another physician to her acquaintance; they described him as a wonderful being, endowed with powers quite supernatural—as 'a conjuror, and one able to raise the devil.' Mrs Thomas's curiosity was excited, as she concluded the doctor must possess talents and acquirements beyond their conception. He was accordingly invited to visit her, and his first appearance was sufficiently imposing. He was dressed in 'a greasy black grogram,' which he called the scholar's coat; he wore a long beard, and in every mark of a happy negligence was every inch a philosopher. He brought with him various philosophical instruments, and exhibited several experiments, intending to impress his new acquaintance with all due respect; but fearing she might impute his skill to dealings in the black art, he explained them in a confidential whisper. Mrs Thomas, seeing that he had a scientific turn, advised him to make his talents known, and to push himself forward in the world. He confided in her that he had a great work in hand, but that it was of such a nature as would involve him in considerable danger were it known. Flattered by seeing the confidence which he placed in her honour, the lady ventured to hint her wish to hear the important secret. Gratified by perceiving that he had awakened her curiosity, he described to her the pains which he had taken, and the means which he had used, for the discovery of the philosopher's stone, and with what exultation he succeeded in obtaining the grand secret of projection. In proof of his success, he produced a bit of gold, into which he avowed he had transmuted a piece of lead, which he had picked from the casement of his window. Mrs Thomas, who had always felt intense interest in the subject of alchemy, listened eagerly, but asked why he had not made more gold. He told her that he had no more lead. She instantly sent up to a closet for some which she had, and gave it to him, requesting that he would bring it the next day transmuted into gold. The next morning, accordingly, he appeared with an ingot of gold, weighing two ounces, which he assured her was the very lead which she had given to him, transmuted into the precious metal. She found, on conversing with him, that he was not able to turn his valuable discovery to advantage, as the powder which was necessary was out, and he was without the means of purchasing more. She inquired how much would make a stock that would maintain itself. On hearing that fifty pounds would, in nine months, produce a million, she requested he would let her have the ingot, with which she hurried into town for the purpose of having it tested: it proved fine beyond the standard.

Convinced of the truth of all which the alchemist had asserted, she returned, and drew L.50 from her bank, which she placed in his hands. The great difficulty was now to carry on, without exciting suspicion, a work which was prohibited, and which might probably lead to dangerous consequences. The difficulty was, however, soon surmounted, and arrangements were made without delay. A house within a few miles of London was taken; here the philosopher was to have a public laboratory as a professed chemist, and to dispose of medicines to the apothecaries, by which the expense of the establishment was to be defrayed. While the grand undertaking was going on, Mrs Thomas acted as housekeeper, and the doctor and his man boarded with her; their sleeping apartment being in a different wing of the house from that which she and her daughter

occupied. As she knew that it would require time to complete the work in hand, she managed the household affairs with the strictest economy. In the meantime the doctor instructed the little Corinna in arithmetic, mathematics, and Latin. At length the wished-for time arrived—riches seemed already within grasp—everything was prepared—the vitriol furnace was set to work—it required the most intense heat for several days; but unfortunately, when everything appeared in such forwardness, the house caught fire, the stairs were consumed, and the family, who were in bed at the time, narrowly escaped with their lives. By this untoward accident Mrs Thomas lost L.300; yet still she was as sanguine as ever in her expectations. The indefatigable philosopher applied himself to carrying on the process in the other wing of the house with undiminished energy, and success and unbounded wealth were fondly anticipated. On the Sunday evening after the fire, Mrs Thomas had collected her little family, and was engaged in reading to them, when a violent report, as of cannon, was heard; the building shook to its very foundation, and the lady and her audience were forcibly dashed from their chairs. They looked on each other with terror and dismay, unable to divine the cause of the violent commotion. The philosopher, pretending to revive, ran about the room in a paroxysm of frenzy, stamping, wringing his hands, and tearing his hair; and crying 'Undone! undone!' he rushed out, like a maniac, to examine his workshop. With affected agitation, he unlocked the room door. His crucibles were found split from top to bottom, all his instruments lay scattered about, and his precious amalgam crumbled to dust on the ground. Mrs Thomas became suddenly enlightened, convinced that she had been cheated. The philosopher waited in silence, expecting a proffer of a further supply; but found himself disappointed. Mrs Thomas dismissed him; but fearing that he might be driven to some act of desperation, she kindly gave him five guineas at parting. She suffered for her credulity and imprudence. She was overwhelmed with regret and confusion for having thrown herself into the hands of a madman or an impostor, by which her means were much reduced; her health became affected; but time and patience at length restored her.

In the meantime Corinna had become attached to a Mr Gwynnet, of the Middle Temple, whose fond sympathy and unshaken constancy must have supported her under many trials—the greatest of which, perhaps, were her delicate state of health, and the despotic rule which, there is reason to think, her mother exercised over her. Mrs Thomas removed to Bloomsbury, and renewed her acquaintance with several of her husband's influential friends, who promised to serve her. By strict economy, she contrived to make an elegant appearance, so that her circumstances were supposed to be much better than they really were. The Duke of Montague appeared deeply interested for the widow and her daughter, and in touching on the state of their affairs, he advised Mrs Thomas to let part of her house. She replied that, though she was ill suited to dealing with strangers, she would gladly receive a family who wanted the accommodation which she could afford, if any such should present itself. 'I myself will be your tenant,' said the duke. 'You do not, I see, believe me; but I do assure you that I am serious. I wish to enjoy freedom from ceremony, which I cannot at home, and to have the company of a few friends without parade or show.' The bargain was made, and his Grace was to pass for Mr Freeman of Herefordshire. In a few days after, he ordered dinner for some country friends; but great was the surprise of Mrs Thomas when she saw the Duke of Devonshire, Lords Buckingham and Dorset, and Sir William Dutton Calt, introduced under feigned names. She concluded the whole matter to be a mere frolic; but after the lapse of several days, these noblemen, who were constantly together, confiding in her honour, intrusted her with the secret of their meetings, which were held for the purpose of consulting on the revolutionary movement. Though every precaution was taken to elude suspicion, it was at length awakened, and Mrs Thomas's house was closely watched; but those appointed to act as spies soon betrayed their trust, and allowed the meetings to go on without interference or notice. Time passed. Secret consultations were no longer held, for the Revolution was effected. The Duke of Montague and his friends took leave of Mrs Thomas, with grateful acknowledgments for the zeal and fidelity which she had shown in the cause, which was now crowned with success, and with earnest assurance of their determination to have her rewarded, by being appointed to some situation in the royal household, or receiving the grant of a pension. But benefits are soon forgotten, and Mrs Thomas and her good service were not thought of.

At length, knowing the interest which the Duke of Montague possessed, she determined to apply to him in favour of Mr Gwynnet; for, though asking nothing for herself, she was most anxious to promote the happiness of her child. The duke was gracious, and said that he would comply on condition that the request was made by Corinna in person. It was with no slight degree of surprise that Mrs Thomas heard her daughter positively refuse to avail herself of this promise. She had conceived that she would have hailed the prospect of good-fortune with joy, and have hastened to solicit his Grace for her betrothed lover. Her mother's wishes had been ever a law to her, and it was strange that she should oppose them now, when they were solely for her welfare. How strange that she should peremptorily decline what would realise hopes long and fondly cherished! It was in vain, by arguments or intreaties, to try to overcome her determination. The resolution of a creature so gentle cou'd not be ascribed to obstinacy or caprice, and at length, yielding to her mother's intreaties for an explanation, she acquainted her that the duke had dared to make dishonourable proposals to her. Her mother then of course acknowledged the propriety of her daughter's resolve.

A hard task remained for Corinna, but as it was one which her deep sense of honour dictated, it was accomplished. As every prospect of bettering her fortune seemed closed, and as she thought her lover's friends would disapprove of a match so unequal, she told him that all between them was at an end; and they parted. She must have suffered deeply in making this voluntary sacrifice of her happiness; but doubtless she was supported by the consciousness of the rectitude by which she had been actuated.

She now endeavoured to direct the energies of her mind, with redoubled assiduity, to literary pursuits, and thus time sped on. Her mother fell into a severe illness, in which Corinna tenderly watched over her. It was at this time that Mr Gwynnet's father, touched by his son's ardent attachment, determined to remove every obstacle to his union with Corinna, by settling a handsome independence on him. The happy lover hastened to claim his bride, but was again disappointed: she was tending her mother, and declared she would never leave her unless she recovered. She could never, she said, leave her mother to die among strangers. Still urged by her lover, she replied, that as she had not thought sixteen years long in waiting for him, he could not think six months long in expectation of her. He answered, with a deep sigh, 'Six months, my Corinna, at this time, is more than sixteen years have been. You put it off now, and God will put it off for ever.' His prediction was fulfilled. He went to the country next morning—he made his will—he sickened and died. The sad event occurred on the 16th of April 1711. Mr Gwynnet had left a bequest of L.600 to Corinna. But from this she never derived any personal benefit. Only a moiety of her lover's legacy reached her hands, which she immediately appropriated to the payment of her mother's debts. For the remainder, she was involved in the harassing turmoils of law, and never got possession of it. It was amidst these troubles, and with

an infirm mother depending upon her, that this poor lady struggled to realise a little money by her writings, and became one of the slaves of the infamous Curll, who seems to have been a man destitute of both feeling and honourable principle. In time, her mother died. She says, speaking of this bereavement, 'Sorrow has been my food ever since.' Her own death took place in 1730.

We now come to consider Corinna's quarrel with Pope. Much credence has been given to the statement that, when reduced to the most extreme distress, Curll took advantage of her necessities, and wheedled from her some letters from Pope to Mr Cromwell, which she happened to have in her possession, and for which he gave her a sum of money. That Curll was capable of doing so, cannot be doubted; but surely it seems most unlikely that a lady who had withstood the offers of fortune, and the promptings of an early and fond attachment, when opposed to high principle, could have degraded herself by a mean and sordid action, however sorely pressed. That the whole affair was a contrivance of Pope himself, appears by no means unlikely, when the circumstances are considered. A preface, signed by Pope and Swift, had appeared a short time before, prefixed to a volume of miscellanies, which was evidently written by the former. In this preface he complains of the robberies committed on authors by the clandestine seizure and sale of their papers. It was shortly after this note of preparation that the volume of Pope's letters, published by Curll, appeared. Corinna was accused as the accomplice in the transaction on which Pope grounded the quarrel, which gave an ostensible colour to the charge. The unfortunate and indigent have but little power of repelling attacks. There was an attempt, too, to sully her fair fame with the breath of slander; and this great wrong was inflicted by him who disputed her right to his brother's legacy, and who crushed her so completely by the expenses in which she was involved in the endeavour to make good her claim, that she languished for a while in confinement, and for the rest of her days in obscurity.

All the subsequent circumstances connected with the publication of Pope's correspondence come to the same purport. Curll, pleased with the success of the volume of letters, preserved the originals carefully in his shop; and the collection is now deposited among Rawlinson's manuscripts at the Bodleian. A new edition, with additions, was announced; and an advertisement was put forward that Curll was ready to treat for any of Pope's letters which might be offered. Soon after, according to Curll's account, he one evening received a visit from a man in a clergyman's gown, but with a lawyer's band, who negotiated with him for the sale of a number of printed volumes containing letters by Pope. The bookseller paid for them, without asking whence they came; but he did not publish them till he had apprised Pope of the circumstance. The poet only replied by a contemptuous advertisement in the newspapers, professing to think it dangerous to have any correspondence with Curll. The bookseller then brought out the letters, which were of a kind to impress the world with the most favourable opinion of the writer's candour, tenderness, and benevolence, although Pope professed to be greatly ashamed of them, as trivial things, full of levities and wrong judgments on men and books, and only excusable on account of the youth and inexperience of the writer. When the public expressed some surprise that, nevertheless, they were not forgeries, but real letters, the poet explained that, since the appearance of his correspondence with Mr Cromwell, he had been advised to collect his letters; he had consequently copied them into two books, which he deposited in Lord Oxford's library: from thence it was that they had been subtracted. His only remedy, he said, was to publish an authentic edition of the whole of his correspondence; and this he did in 1737.

The sagacity of Dr Johnson, and the ingenious inquiries of Mr D'Israeli, have now satisfied the world that the whole of this latter transaction was a subtle contrivance of Pope to furnish himself with a pretext for the extraordinary step of publishing his letters to his friends in his own lifetime. But are we to believe that he commenced his plans only when he sent the mock clergyman to Curll's shop? Are we not justified rather in believing that to himself primarily was the publication of the first volume also owing? If so, how utterly detestable must have been the spirit of this spiteful little man, who could not only lead another into a crime, but, with a solemn face, pretend to treat it with due severity, and, in doing so, use such language as it is foulness inexpressible for any man to use regarding any woman!

FURTHER GOSSIP FROM LONDON.

June 1846.

The turmoil which occurs in and about London during the week of Epsom races, affords a curious insight into the tastes of a large portion of the inhabitants. Epsom is about fifteen miles from town, and, in consequence of the distance, there are few or no pedestrians: all find their way to the great centre of attraction on horseback, or by some kind of vehicle. Early on each day of the races the streets exhibit a more than usual bustle; thousands of horses and carriages are seen pouring onward; and the weather being fine, everything is gay and lively. Wednesday is the great day, popularly called 'the Derby,' from the late Earl of Derby having given a prize to be run for on that day. The Derby, or rather the *Darby*, as the people pronounce it, is the holiday of holidays—the event looked forward to for months, if not for the whole year. In every company the Derby is the subject of conversation. Not to go to the Derby is being next thing to nobody. During the day of the Derby, after the bustle of getting away is over, London seems empty. The streets have a quietness which is strikingly in contrast with the at other times incessant turmoil. The Derby this year was more than usually brilliant; the concourse tremendous. A gentleman, who seems to know all about these things, tells me that, independently of what is lost and won by betting, the money turned over that day, on account of the race, could not be less than a million. About two hundred thousand people were present, the very poorest of whom would spend a sovereign. In general, however, the expenditure would be nearer five pounds a-head. The hire of a very large number of the carriages for the day was twenty guineas each. The money paid for toll-bars may be estimated at L.10,000. Being at dinner in a gentleman's house on the line of road to and from Epsom, I had an opportunity of seeing the rush homeward in the evening. It was a continuous flow of horses and carriages for several hours, and it was not all exhausted at midnight. The shouting and singing, the flourishing of sticks and empty bottles, and the frantic pell-mell galloping of overdriven horses, not to speak of the dust-covered clothes of the riders, made up a curious but dismal spectacle. What, however, appeared to me as most remarkable, was the great proportion of people belonging to the middle and humbler classes. Perhaps three-fourths of all the vehicles were of the species of gigs called Whitechapel carts—used by bakers, green-grocers, and other tradesmen. The greater number of these apparently contained whole families—father, mother, and children—all dressed in their best, and with faces stewing with heat and excitement. There were likewise many tilted vans or wagons, containing workmen

who had clubbed to pay the expenses of the excursion. I was surprised to see so few persons of fashion, and, in particular, so few ladies: these, however, I am told, keep up for 'the Oaks' on Friday. The bulk of those who patronise the Derby are, in short, shopkeepers, shopkeepers' assistants, and tradesmen. The zeal with which these classes take up the affair is amazing. All, individually, bet less or more on the horses; and at the public-houses, guinea stakes clubbed together are drawn for by workmen. The whole thing is a kind of Juggernaut of morals—an immolation of every virtue. So eager are some persons to go to the Derby, that they would make almost any sacrifice to be present. I have heard of a chief functionary in a haberdasher's shop giving up a situation of L.500 a-year, in consequence of his request to attend the Derby being refused.

Seeing that, notwithstanding all sorts of improvements, the love of horse-racing continues pretty strong in England, some may be inclined to take rather desponding views of social advancement. But as one swallow does not make a summer, so the prevalence of one foolish practice does not render things utterly hopeless. Attendance at horse-races, like a love for dram-drinking, is going off at the skirts of society. It is not so fashionable as it was, and is in many respects less odious. Besides, how many harmless and rational kinds of recreation are now observable! Forty years ago, duck-pelting was a common Sunday and Monday amusement among the working-classes of the metropolis. All this is gone. On Mondays and holidays, great numbers of well-dressed working people, men and women, go out, in neatly-decorated vans, to enjoy a day's sunshine and fresh air in Epping Forest. In entering the city by Shore Ditch, I often meet these vans on their way to the glades and fields, where, as I have at times observed, the parties enjoy themselves in picnics on the grass with as much propriety as if they belonged to classes of a higher rank. And why not? Van excursions to Hampton Court, Epping Forest, Dulwich, Hampstead, and other quarters, are among the signs of the times. The working-classes have only to think and act with prudence, in order to secure many benefits and pleasures hitherto assumed to be incompatible with their means and position.

I do not know that anything shows so effectually how much reading is going on now-a-days, as the universal establishment of book and newspaper stalls at railway stations. Some of the keepers of these stalls sell more books than many a large shop. The works disposed of being only for perusal in the railway carriages, are of course generally of a light and cheap class; but it is interesting to notice that they are also of an improving, or, at all events, not of an objectionable nature. The sales effected at the terminus of the London and Birmingham line are so considerable, that the bookseller, I am told, pays L.40 per annum as rent for his stall.

I observe that all the lines of railway going out of London are now provided with electric telegraphs. Each line has four, or five, or more wires, communicating respectively with different chief stations, by which means intelligence can be conveyed either along the whole, or a part of the way. Government has a special wire, or wires, on the South-Western line, by which there is communication to and from the dockyard at Gosport. The order to get a ship ready for sea could thus be given in an instant of time. Science never achieved a more wonderful feat than this: it is a marvel above all the marvels of the age.

Desirous of seeing the atmospheric railway principle in action, I lately visited the line which proceeds from London to Croydon, a distance of ten miles. The terminus is at the station of the Dover railway, London Bridge; and along that line, for two or three miles, the train to Croydon is in the first place drawn by a locomotive. Having gone so far, the train is run upon the atmospheric line, and is conducted on it to Croydon, stopping at Norwood station by the way. The apparatus consists, as is well known, of an iron tube about a foot in diameter, fixed on the ground, between the rails; on the upper side is a seam, affording a connexion between the piston within and the first carriage in the train. There are three stationary engines, erected in handsome edifices, for producing the necessary suction. I confess to being somewhat disappointed both as to the rate of speed and the equability of the motion. We went more slowly than we had previously done with the locomotive, and the movement was not smoother than that on ordinary lines. There were likewise occasional unpleasant puffs of smoke from the friction on the greasy seam of the tube—a thing which I had not by any means calculated on. It would be presumption for me to speak of this species of traction as a failure. I have no doubt it may be adopted in certain situations with advantage; but experience, so far as it has gone, does not warrant its general application. Before dismissing railways, I may allude to a fact which excites no little interest at present in London: the traffic is increasing so fast on the principal lines, that the respective companies cannot find carriages or locomotives to meet the demand. Double the number of trains would in some cases be put on, if locomotives could be procured. With such facts as this, I should hold it to be impossible to restrain railway enterprise within sober bounds; that is to say, without a general and soundly-considered law on the subject.

At the spot where I reside, which is pretty nearly the centre of the metropolis, the general post is not delivered till about eleven o'clock in the forenoon; on Mondays, it makes its appearance at twelve, or sometimes later. I hear everybody complain of the inconvenience of these late deliveries; yet as London is ill to move, nothing seems to be done towards remedying the evil. To myself, it forms a serious drawback on the pleasures of a short residence in town. Finding it necessary to remain at home till the delivery takes place, my time is a good deal cut up: it is noon before I can go out. A number of merchants, who are particularly anxious for a delivery of their letters as early as nine o'clock, pay a pound per annum to the postman of the district for the accommodation. These payments enable the postmen to hire supernumeraries; in fact, to employ servants to do a part of their work. What a revelation is this of post-office management! So few men employed to carry out the letters, that they cannot get through their duties in proper time, or without hiring assistants out of their own perquisites! But this is not all. The poor men are not sufficiently remunerated for their incessant labour. Left to eke out their salaries by presents, they further increase their means by the sale of an annual London directory. This work, got up by their united efforts, is a closely-printed octavo of 1900 pages, and forms a valuable body of knowledge. I am told that, unless for the profits of this undertaking, the situation of postman would not be worth having—in other words, government would seem to pay this useful body of men such small wages, that they could not live unless they at the same time depended on a private trading speculation. I have heard of one postman clearing upwards of L.150 annually by this perfectly

legitimate means. I very much admire some of the arrangements of our stupendous post-office system; but there are features in its character which one cannot contemplate with pleasure, and none with less than the generally shabby way in which the services above alluded to are requited.*

When I was last in town, a conspicuous object was continually moving about the streets, in the form of a huge hat, on wheels, drawn by a horse, and bearing placards referring to the shop of a particular dealer in that necessary article. The thoroughfares are, in fact, seriously incommoded by great perambulating machines, stuck over with placards recommending all sorts of wares. The latest novelty I have seen is a large pavilion-shaped box, moving along without any visible means. On looking narrowly, however, we perceive that it is urged by wheels within; but whether the *power* is a man or a donkey, no one can divine. A man walks along to keep it company, as a guard of honour. Sir Peter Laurie has attempted to grapple with this nuisance of advertising vans. The *Times* has also lifted up its voice, denouncing the inconvenience in eloquent terms:—'If our memory does not deceive us, it originated in a moderate-sized exhortation to the public "to reform their tailors' bills," or to emulate the conduct of a gentleman in a field-marshal's uniform, giving a dinner to five or six other military men—all field-marshals like himself—who are in raptures over a few blue and white plates, which the host was emphatically declaring he had purchased recently, in "cash down," for a mere trifle. He was also adding, for the further information of his distinguished guests, that the service included "four vegetables, two sauces, a soup-tureen, and a salad-bowl." For some time after the disappearance of this great military *tableau*, the advertising vans seemed to have disappeared, with the exception of an occasional visit from a perambulating hat, or a party of wax gentlemen, jolting about in the most uncomfortable manner, by way of illustrating the newest spring fashions. These, however, being few and far between, might have been suffered to pass, particularly as, by their voluntary disappearance one after the other, it would seem that, owing to the good sense of the public, the objectionable style of puffing got cured in the most effectual manner possible; namely, by its never answering. Latterly, the evil has broken out in so many quarters at once, that there seems no chance of stopping it without the intervention of authority. Quackery of every kind is rearing its paper placards on the moving mountains, which, under the name of advertising vans, form obstructions, as if so many fragments of Alp or Apennine were thrown into the streets of the metropolis. Every puffing establishment sends out its miniature Mont Blanc of white paper placards; and the wonder is, that an occasional upset does not bury some unfortunate equipage of smaller dimensions under an avalanche. Unless some steps are taken, we are quite sure that the evil will become greater and greater, for every quack seeks to go beyond the others in the magnitude of his puffing apparatus.'

A stranger looks with fear and wonder on these desperate efforts to which the human being is reduced in London in order to obtain a livelihood, and longs to get back into the peace and quiet of the provinces, where, happily, it is yet possible to be a tradesman, and to live as such, without the necessity of ceasing nearly altogether to be a man.

For the last four years there has been a surprising and unaccountable mania for erecting statues of the Duke of Wellington. The favourite form is equestrian, which sculptors have not been always able to manage very happily. The best yet got up is that in front of the Exchange, Glasgow—rather trifling in details, yet good. They have made a very poor thing of his Grace in front of the Exchange in London. He is sitting on horseback, half-dressed, with a blanket thrown over his shoulders, and nothing but stockings on his feet and legs. There is at present a great pother in town about hoisting a monstrous equestrian statue of the duke to the top of the arch which stands at the north-west corner of the Green Park. This arch itself is a clumsy enough work of art. The sandstone of which it is built is already mouldering away, and some of the finer parts of the cornice are gone. On the summit of this modern, but decaying edifice, a heavy square base of stone has been erected; but it is feared that, when to this is added the monster statue, the whole affair will come down! There is, to all appearance, not only a great want of taste, but a want of prudential consideration in the manner in which public monuments are got up in the metropolis. What a contrast to the address with which the French embellish their capital!

Some time ago young ladies were great cultivators of albums, for which they were continually begging poems from their friends, and bothering every one for miscellaneous contributions. The epidemic, I find, has taken a new turn in London. Poems and sketches are no longer in vogue: the rage is all for letters and autographs. To such a height has this been carried, that the collecting of private letters, notes, and autographs has attained the importance of a profession. There are head and sub-collectors. The subs are young ladies and others, who go about worrying acquaintances for anything in the form of writing they can pick up. 'Could you favour me with a letter of Sir Robert Peel?' 'Perhaps you could let me have an autograph of the Rev. Sidney Smith?' 'I should like so much to have a note written by Wordsworth!'—are the sort of questions one often hears put. Letters and autographs collected in this way are sometimes handed at so much to the keeper of a depôt of the article, by whom albums can be furnished at a minute's notice. In going down Maddox Street the other day, I stumbled on one of these depositories. My eye caught an announcement of *twenty thousand letters and autographs being for sale within*. Surely this is an undignified and illegal species of traffic. Letters are written in confidence, without the slightest idea that they will become objects of interest to third parties, or that they will be catalogued at so much a-piece. Their disposal, either by gift or sale, is a breach of trust. It has been determined in the courts that a letter remains the property of the writer—it is his copyright. Taking, however, a less grave view of the subject, it must strike every one that the disposal and exhibition of private letters and notes is a serious indecorum, which must end in breaking up the mutual confidence of friends, and causing an unpleasant reserve where there ought to be a genuine pouring out of the feelings. Ladies who pridefully, and amidst the gaieties of a drawing-room, show off their stock of letters and autographs, are seemingly unconscious that they are committing a decidedly immoral and illegal act—that they are parading what are, to all intents and purposes, stolen goods. Let all this kind of thing be put down: let ladies cease to gather and parade epistolary property; and let people refrain from appearing amused with such exhibitions. The reading of a private note by a third party is an act of no higher moral standing than the listening to a conversation through a key-hole!

Another queer practice prevails to a certain extent among young ladies here. On calling in the forenoon, you will very likely see them busy with a needle at a tapestry frame. The industry exhibited in this way is remarkable; but, unfortunately, it is not in all cases genuine. Some of the fair needlewomen are *bona fide*, but many of them are only *sham* workers. Hundreds are mere pretenders, and cannot do a stitch properly, unless by chance: yet they have a very beautiful half-finished piece before them. How is this? A young lady explained to me the mystery as follows:—There are establishments in London for the preparation and

* Since putting the above in type, we observe by a London newspaper that the post-office authorities have in contemplation the abolition of the 'early delivery,' the purchasing of the copyright of the directory, and some other changes. It remains to be seen how soon the letters will be generally delivered in the morning.—Ed.

sale of half-executed pieces of needlework. In one place fifty girls are so employed; their good taste and nimble fingers preparing groups of flowers or other figures for fine-lady customers. From such establishments the pieces are sent home incomplete, and with the needle stuck in the very rosebud which the lady is to be seen pretendedly working! Oh that everlasting rosebud! She is always at it when the triple rap is sounded by the knocker. *This*, too, is immoral.

CONVERSATION.

THE art of conversation is generally considered to be something so easy of attainment—so natural a consequence of that gift of rational speech which distinguishes man from the rest of creation—that few persons take any trouble to prepare themselves for its practice. Perhaps this is the reason why, when we recall conversations in which we have taken a part, we generally find that but a small amount either of pleasure or improvement had been obtained from them. Among the educated classes, where we should naturally expect to find conversation pure, animated, and intellectual, there are many persons so much the slaves of conventional forms of speech and action, that the light of reason, or the warmth of feeling, never breaks through. Lord Bacon, long ago, described such people 'as having certain commonplaces wherein they are good, but want variety; which kind of poverty is for the most part tedious and ridiculous. It is good,' he continues in his quaint and solid style, 'in speech of conversation, to vary and intermingle speech of present occasion with arguments, tales with reasons, asking of questions with telling of opinions, and jests with earnests;' all which presupposes extensive and varied information, and that union of quick perceptions with good-sense and good-humour which we now call *tact*. This power was considered by Hazlitt 'to consist in the being completely aware of the feeling belonging to certain situations, passions, &c. and the being consequently sensible to their slightest indications or movements in others;' and Rousseau must have had a similar idea of it, when he laments that he had not himself 'the calmness to think, and the quickness to speak, what was most appropriate in society, where one should know everybody's character and history, so as to say nothing that can give offence to any one.' Indeed many men, who have been conspicuous in the eye of the world for their fine mental qualifications, have failed in the same way: profound philosophers and scholars, like Sir Isaac Newton, having been proverbial for absence of mind, taciturnity, and awkward bashfulness. They had the 'reading which makes a full man,' but not 'the speaking which makes the ready man.'

Cowper, whose sensibility unfitted him for the rough realities of life, but who estimated, as they deserved, the consolations of genuine friendship, describes conversation —such, probably, as he enjoyed in his own select circle—as

'A gift, and not an art.'

Yet the kind and confidential intercourse which is the charm of the inner domestic life, will not bear to be confounded with the conversation suited to that wider circle of society where the gay and the gifted meet, as on an arena, some to observe, and others to display talent and acquirements; for there must be good listeners as well as good talkers. 'One reason,' says the witty Rochefoucault in his Maxims, 'why we meet with so few persons who are reasonable and agreeable in conversation is, that there is scarce any one who does not think more of what he has to say, than of answering what is said to him. Even those who have the most address and politeness, think they do enough if they only seem attentive; at the same time, their eyes and their minds betray a distraction as to what is addressed to them, and an impatience to return to what they themselves were saying; not reflecting that to be thus studious of pleasing themselves, is but a poor way of pleasing or convincing others; and that to hear patiently, and answer precisely, are the great perfections of conversation.' Rochefoucault was a man of the world, one of the proudest and most polished of that ancient nobility which gave the law of manners to Europe. More than two hundred years have elapsed since he wrote his Maxims, yet Emerson, a living American writer, in the second series of his Essays, curiously corroborates this opinion in what he writes of his own republican countrymen. 'That happens,' he observes, 'in the world which we often witness in a public debate. Each of the speakers expresses himself imperfectly; no one of them hears much that another says, such is the preoccupation of the mind of each; and the audience, who have only to hear, and not to speak, judge very wisely how wrong-headed and unskilful is each of the debaters to his own affairs.' The cynical spirit of both these writers discerned the selfishness which pervades the human bosom, though the observed and the observers were placed in circumstances of the most opposite nature.

The late William Hazlitt, a man gifted with great powers of observation and expression, was of opinion that actors and authors were not fitted, generally speaking, to shine in conversation. 'Authors ought to be *read*, and not heard;' and as to actors, they could not speak tragedies in the drawing-room, and their wit was likely to be comedy and farce at second-hand. The biography of men of letters in a great measure confirms this opinion: some of the greatest names in English and French literature, men who have filled books with an eloquence and truth that defy oblivion, were mere mutes before their fellow-men. They had golden ingots which, in the privacy of home, they could convert into coin bearing an impress that would insure universal currency; but they could not, on the spur of the moment, produce the farthings current in the market-place. Descartes, the famous mathematician and philosopher, La Fontaine, celebrated for his witty fables, and Buffon, the great naturalist, were all singularly deficient in the powers of conversation. Marmontel the novelist was so dull in society, that his friend said of him, after an interview, 'I must go and read his tales, to recompense myself for the weariness of hearing him.' As to Corneille, the greatest dramatist of France, he was so completely lost in society, so absent and embarrassed, that he wrote of himself a witty couplet, implying that he was never intelligible but through the mouth of another. Wit on paper seems to be something widely different from that play of words in conversation which, while it sparkles, dies; for Charles II., the wittiest monarch that ever sat on the English throne, was so charmed with the humour of 'Hudibras,' that he caused himself to be introduced, in the character of a private gentleman, to Butler its author. The witty king found the author a very dull companion; and was of opinion, with many others, that so stupid a fellow could never have written such a clever book. Addison, whose classic elegance of style has long been considered the best model for young writers, was shy and absent in society, preserving, even before a single stranger, a stiff and dignified silence. He was accustomed to say that there could be no real conversation but between two persons—friends—and that it was then thinking aloud. Steele, Swift, Pope, and Congreve, men possessing literary and conversational powers of the highest order, allow him to have been a delightful companion amongst intimates; and Young writes of him, that 'he was rather mute in society on some occasions, but when he began to be company, he was full of vivacity, and went on in a noble strain of thought and language, so as to chain the attention of every one to him.' Goldsmith, on the contrary, as described by his contemporary writers, 'appeared in company to have no spark of that genius which shone forth so brightly in his works. His address was awkward, his manner uncouth, his language unpolished: he hesitated in speaking, and was always unhappy if the conversation did not turn upon himself.' Dr Johnson spoke of him as an inspired idiot; yet the great essayist, though delivering oracles to those around him in pompous phrases, which have been happily described as spoken in the Johnsonese tongue, was not entitled to be called a good converser.

Nearer to our own time we have had many authors whose faculty told twice. Sheridan and Theodore Hook were fellows of infinite jest: they could 'set the table in a roar,' and fill pages with pathos and wit of such a quality, that it makes their survivors think 'we could have better spared better men.' Burns was famous for his colloquial powers; and Galt is reported to have been as skilful as the story-tellers of the East in fixing the attention of his auditors on his prolonged narrations. Coleridge was in the habit of pouring forth brilliant, unbroken monologues of two or three hours' duration, to listeners so enchanted, that, like Adam, whose ears were filled with the eloquence of an archangel, they forgot 'all place—all seasons and their change;' but this was not conversation, and few might venture to emulate that 'old man eloquent' with hopes of

equal success. Washington Irving, in the account he has given of his visit to Abbotsford, says of Sir Walter Scott, 'that his conversation was frank, hearty, picturesque, and dramatic. He never talked for effect or display, but from the flow of his spirits, the stores of his memory, and the vigour of his imagination. He was as good a listener as a talker; appreciated everything that others said, however humble might be their rank and pretensions, and was quick to testify his perception of any point in their discourse. No one's concerns, no one's thoughts and opinions, no one's tastes and pleasures, seemed beneath him. He made himself so thoroughly the companion of those with whom he happened to be, that they forgot, for a time, his vast superiority, and only recollected and wondered, when all was over, that it was Scott with whom they had been on such familiar terms, and in whose society they had felt so perfectly at their ease.'

This is a charming testimony given by one man of genius to the character of another; and if the author of the life of Columbus had been required to point out an example combining conversational qualifications of the best kind, he could not have written more to the purpose. A mind informed by reading—reading confirmed or corrected by daily observation of life—the powers of observation all made subservient to the active spirit of kindness, and the patient abnegation of self, which are the only true and unfailing sources of politeness—these are the requisites to a real success in society, so far, at least, as relates to the every-day intercourse of this every-day-working world; and all of them were evinced in the highest degree by Sir Walter Scott.

FACETIÆ, &c.

A Mystery Solved.—Some years ago attention was particularly called to a tombstone in Worcester cathedral, inscribed with the one word, 'Miserrimus' (a most wretched man). So brief, yet so painfully expressive a record, naturally awakened a good deal of conjecture, and we believe that a whole book was written upon the supposed career of the nameless tenant of a mysterious grave. In Widcombe churchyard, Bath, lately, a like inscription—the word 'Annette,' upon a broken column—attracted the notice of a poet of no mean pretensions, who wrote some very affecting lines, full of touching conjecture, as to the mortal pilgrimage and affecting death of the fair deceased, which verses were inserted in one of the most popular of our monthly periodicals. The *denouement* of the *subject* is rather curious. A surgeon, who dates his success in his profession from the time of the occurrence, states that 'Annette' was almost his first patient, and that he was called in by an old duchess-dowager, the foster-parent, who resided on the North Parade, Bath, and who, with tears in her eyes, intreated the doctor's best offices for the poor invalid. The physician was enabled to effect a temporary recovery; the *malade*, however, eventually had a relapse, and died. But who was the fair deceased? None other than *a favourite Bleaheim spaniel!* The dowager was at first inconsolable for the loss, but so sensible of the kind attention of the medical attendant, that she not only appointed him her own professional adviser, but recommended him to others, thus establishing his fame, and making his fortune The defunct spaniel was, by means of a douceur to the sexton, interred in a Christian burial-ground, and hence the touching elegy of the muse!—*Newspaper paragraph.* [If our memory serves us rightly, a recent Guide to Worcester states that Miserrimus was a crazy old gentleman of the time of Charles I., who had had a great number of quarrels with his relations about money matters, and, from mere whim, caused this inscription to be put upon his grave.]

A Poetical Despatch.—M. Falck, the Dutch minister, having made a one-sided proposition for the admission of English ships, by which a considerable advantage would have accrued to Holland, a long and tedious negotiation ensued. It was dragged on, month after month, without arriving one step nearer to a consummation, the Dutch still holding out for their own interests. At last Mr Canning's patience was exhausted. Sir Charles Bagot, our ambassador at the Hague, was one day attending at court, when a despatch, in cipher, was hastily put into his hand. It was very short, and evidently very urgent; but unfortunately Sir Charles, not expecting such a communication, had not the key of the cipher with him. An interval of intense anxiety followed until he obtained the key, when, to his infinite astonishment, he deciphered the following despatch from the secretary of state for foreign affairs:—

'In matters of commerce, the fault of the Dutch
Is giving too little, and asking too much;
With equal advantage the French are content,
So we'll clap on Dutch bottons a twenty per cent.,
Twenty per cent.,
Twenty per cent.;
Nous frapperons Falck with twenty per cent.
GEORGE CANNING.'

The minister kept his word. While this singular despatch was on its way to the Hague, an order in council was issued to put into effect the intention it announced.—*Bell's Life of Canning.*

Scottish Gallicisms.—It is curious to hear French words Scotticised, as so often occurs. For instance, *assiette*, a plate, forms a word of the same meaning, and is contained in Meg Dods's celebrated book of cookery, in the receipt for a certain dish entitled 'Petticoat tails!' This is nothing less or more than the *petits gatelles* (for *gateaux*, the more usual word) of the French cook and confectioner. Another word of French origin is that of 'a haverel,' which signifies a fool or a simpleton. This is derived from the word *Averil* (French for April), an 'April fool.'—*Scotland, its Faith and its Features.*

The Way to get on in the World.—To get on in this world, you must be content to be always stopping where you are; to advance, you must be stationary; to get up, you must keep down: following riches is like following wild geese, and you must crawl after both on your belly: the minute you pop up your head, off they go whistling before the wind, and you see no more of them. If you haven't the art of sticking by nature, you must acquire it by art: put a couple of pounds of bird-lime upon your office stool, and sit down on it; get a chain round your leg, and tie yourself to your counter like a pair of shop scissors; nail yourself up against the wall of your place of business like a weasel on a barn-door, or the sign of the spread eagle; or, what will do best of all, marry an honest, poor girl without a penny, and my life for yours if you don't do business! Never mind what your relations say about genius, talent, learning, pushing, enterprise, and such stuff: when they come advising you for your good, stick up to them for the loan of a sovereign, and if you ever see them on your side of the street again, skiver me, and welcome! But to do any good, I tell you over and over again you must be a sticker. You may get fat upon a rock, if you never quit your hold of it.—*Blackwood's Magazine.*

Old English Delicacies.—'Good old English fare' is a phrase very much in people's mouths; much oftener than the thing they praise. Let us see what a dinner consisted of in the reign of Charles I. Imprimis—'A soup of snails, a powdered goose (not a footman), a joll of salmon, a dish of green fish buttered with eggs.' This was a first course. Then came 'a Lombard pie,' 'a cow's udder roasted,' 'a grand boiled meat,' 'a hedgehog pudding,' 'a rabbit stuffed with oysters,' 'Polonian sausages,' 'a mallard with cabbage,' and 'a pair of boiled cocks.' To these succeeded, as *hors d'œuvres* and *entremets*, 'a spinnage tart,' 'a carbanadoed hen,' 'a pie of aloes,' 'eggs in moonshine,' 'christial jelly,' 'jumballs,' 'quidany,' 'bragget,' and 'walnut suckets.' Cock-ale, surfeit water, canary, sack, and Gascony wines, served to moisten this heterogeneous repast. After this specimen of 'old English fare,' go to the Reform Club and throw yourself on the mercy of Soyer; or, if in want of an appetite, read the Manual of Ude; for French science can alone furnish a remedy for razing out the memory of those British enormities.—*Ainsworth's Magazine.*

'*The Campbells are Coming.*'—It happened, about the beginning of the last century, when 'rugging and riving' prevailed in the Highlands, that Duncan M'Gregor left his sheep-farm on Lochowside, held farther south, and emigrated with his family and flocks to somewhere about the braes of Doune. Duncan was a man of peace and decorum, punctual in his attendance at kirk and market, and had just returned home from Doune fair when he found his eldest son reading a chapter to his mother. There were no pronouncing dictionaries in those days, at least none of them had as yet reached the way-side school of Drumvaich; so Jock blundered on, opened wide his mouth, giving each vowel its broadest sound. It happened that the

book of Job was the subject-matter of the reading; but before the son had proceeded far, the father had begun to nod, and the frequent *tastings* of the fair, and the fatigues of his journey, had somewhat conglomerated his ideas. At last the *sough* of the following words struck his ear—'And Job had seven thousand sheep, and there were three thousand *camels*.' 'Stop, Jock,' said the father; 'come owre that again: how mony Campbells said ye?' 'Three thousand, father.' 'And how mony sheep?' 'Seven thousand, father.' 'Aweel, my man, I can tell ye, gin Job's shouthers had been as near the hills as ours were on Lochowside, he wad needed a' his patience; for the first raid o' three thousand Campbells wad hae made a sad hole in the hirsel.'—*Glasgow Herald.*

CRITICISM IN GERMANY.

The following remarks on this subject are from the *Manchester Examiner's* report of lectures on German Literature, delivered at that town by Mr George Dawson of Birmingham:—'One of the most striking things in German literature was its criticism. England was inundated with reviews; but, until lately, English criticism was an absurdity. At one time the system was to look at the man, and judge of the book accordingly; another system was to look, not at the work, but at the political, religious, or scholastic opinions of the writer; a third system, the followers of which much-belauded themselves, was that of equilibrium, or impartiality, by which faults and merits were so nicely balanced, that no one could say which preponderated. English criticism had now gotten the dandy spirit of the last age, which wondered and admired at nothing—a coldness of air, a starched-cravatism, which could look on the Coliseum, or walk through the Louvre, without betraying an emotion. These men sat on their icy thrones, dealing out praise and blame; but they would not acknowledge that anything was new or wonderful to them. After having dwelt at some length on the character of criticism in England, and shown how frivolous and petty were the objections frequently urged against the highest productions of the intellect, the lecturer proceeded to say that criticism in Germany was another thing. There the critics sought not to find out the mechanism of a simile; they did not weigh and balance a man's character and book; but they strove to render even plainer than the author had done that which the author had written. A good German critic, of the true order, looked upon a work as the symbolic character in which a great man had expressed his thoughts. He was the interpreter between the author and the public. He explained his symbol, and showed the indwelling spirit and the substance that was there. Even upon Shakspeare there had been no very sound criticism until we imported it from Germany, and since then we had begun to understand the poet better than we did before. If any of the audience doubted this, let them read some of the orthodox notes in the editions of fifty or sixty years since. There they would find elaborate disquisitions on the meaning of a word, as to whether a comma should not be a colon, and so on; but if this was criticism on Shakspeare, he would rather have him uncomma'd and uncolon'd, so that he might have more time to make out the spirit, and understand the soul of the author. The criticism on "Hamlet" in the "Wilhelm Meister" had never been excelled, and was a sample of what criticism should be. An Englishman would have shown where Shakspeare got this idea, and where he got that idea; how he pieced them together, and so on; but the German went up to him as he would to nature. He did not go up to him in the style of a man who, when looking at an oak tree, began to ask why it was not higher or broader, why this branch was permitted to remain, and why the trunk was not French polished, but to expound why it was there—to understand its meaning, to find out the divine idea of which it was the symbol, and so to make it plain.'

INQUIRY, DOUBT, CONVICTION.

It is said inquiry means doubt; and, in the creed of some, doubt is the acme of all possible evil. Nevertheless, all deep conviction must be reached through doubt. 'He who begins in doubt, ends in certainty,' says Bacon; 'but he who begins in certainty, ends in doubt.' One may be sunk below, as well as raised above, doubt's stormy atmosphere; and the certainty which cannot stand the blast, is but a transplanted tree not firmly rooted in the soil. We should hear less of doleful warning and deploring on this subject, if men's opinions were generally attained by the process of acquisition rather than of inheritance or conversion. Men do not usually acquire ideas from a state of ignorance and neutrality, as men from a state of poverty acquire wealth: the process is one rather of exchange than of acquisition; for every new truth gained, some old error has been parted with. The mind has been early committed to some dogma without examination—without *doubt;* experience proves its falsity, and then, with many a bitter struggle, after, it may be, much trifling with conscience, it is abandoned, and its place supplied with some other dogma, perhaps not much more reasonable and well-founded. Or, as often happens, the first opinion having been lightly obtained by inheritance, is lightly yielded to conversion, with, it may be, as little mental honesty in the latter as there was mental activity in the former. The power of distinguishing truth has become feeble, from want of exercise; while the habit of 'dreaming that one thinks,' has, from indulgence, grown strong. Hence it is that changes of opinion are at once so frequent, so sudden, and so little satisfactory as evidence either of powerful reflection or of upright purpose. Were the state of doubt and hesitancy, of impartial balancing among various beliefs, less harshly discouraged and condemned (and it is the state that best becomes ignorance or defective knowledge), we should have less of wrong-headed adherence to opinion on the one hand, or of frivolous or interested abandonment of it on the other.—*Dr W. B. Hodgson's Address to the Mental Improvement Society of the Liverpool Mechanics' Institution.*

SCORN NOT THE VILEST.

BY S. W. PARTRIDGE.

Scorn no one, even the vilest. Who art thou
That, with sour purity, dost proudly mouth
And look contempt on folly or on vice?
Even that loath'd outcast, shameless though she be,
That wears the highway through the darksome night,
Polluted and polluting, even she—
She is thy sister. He whom thou callest Father,
Is he not hers? The balmy influence
Of sunshine and of shower, of light and heat,
Distils around for her as well as thee.
Her sin hath not yet quenched her Maker's love,
Let it not thine, nor even in thought disown
The sisterhood of her whom God calls child.
Pure as thou art, she once was pure as thou,
Purer than thou art now. There was a time
In her sad history, when, a beauteous babe,
She nestled in a mother's loving arms,
Guileless as innocence. Ah, let her fall
Arouse thy deepest fears and humblest thoughts!
Perchance thy virtue is indebted more
To weak temptation than to strong resistance,
And snares like those that hedged about her path
Had sapped thy purity and stained thy name.
Nor is thy history ended; what hath been
May be again. Be humble: in her fall
Read, trembling, thine own weakness, lest thy feet
Slide down the smooth and slippery paths of vice.
Fear for thyself, lest thou shouldst live to be
The wretched thing thou loath'st to contemplate;
And hope for her, that she may yet repent,
And live again to virtue and to God.

APPROBATIVENESS.

What the phrenologists call 'approbativeness,' is an excellent development; but we may have it too full. People born without it are intolerable—those who have a superabundance pay dearly enough for being agreeable. They win, without conscious effort—instinctively, as it were—'golden opinions' from those with whom they associate; and too good a reputation is sometimes a severe tax in more ways than one. As with other luxuries, it costs a good deal to support it.—*Mrs Kirkland.*

LIKINGS OF THE UNLIKE.

Amongst the perversities of fortune bewailed by Thomson, is her 'joining the gentle to the rude.' It must be a misfortune for the gentle to enter upon such an alliance, if the qualities of the opposite party are so extremely rough as to be a constant offence to good taste and good feeling. But I am prepared to contend that, within a certain limit, associations of this kind are advantageous, and that, when our inclinations are free, we instinctively seek them as more agreeable than any of an opposite kind. The remark extends to other qualities than those of gentleness and rudeness; in fact to personal associations of every kind. It appears to be a law of our nature, that we should find a solace and satisfaction in connexion with qualities which we ourselves do not possess; and that whatever we are ourselves largely endowed with, *that* do we shrink from in others.

View the operation of this principle even in our earliest days. Those pairings for which children are remarkable, both within the domestic circle and in the more miscellaneous assemblages at school, do not, as a rule, take place between individuals alike gentle, alike dull, alike energetic, alike brilliant. No: the clever boy finds a mysterious pleasure in the society of some unfortunate dunce, in whom the multitude can see no attractions of any kind. The active, irrepressible spirit of the class—he who is always fighting, or playing tricks, and with whom the master has ten times more trouble than with any other boy under his care—this precious youth never assorts with any similar Boanerges or Ajax: he is found to be devoted to some tame, quiet boy, remarkable for his total inability to fight, and who, on the other hand, indifferent to companions of his own stamp, clings to the wild fellow as to something which vastly helps and comforts him. Even where a boy may display somewhat dangerous qualities, it not unfrequently happens that one the very reverse—a jacketed Sir Charles Grandison—finds a strange fascination in his society, and likes him, with all his faults, better than he does any contemporary of merely passable character.

Some fair readers of this paper have probably received their education at a boarding-school. I put it to all such to recall the prettiest, brightest, most accomplished of their companions—she who was the star of the school, the pride of the mistress, the glory of the dancing-master, and the extolled of every other teacher whose province was the outward and ornamental. Now, there is such a thing as jealousy; but I do not think it will wholly account for what is found in the history of this school-paragon, that she hardly ever forms an attachment amongst the other young ladies of a showy character, but almost invariably selects for her friend and confidante one who, with perhaps a fair endowment of good sense, is notably quiet and unpretending, possessed of solid, and not of showy qualities; in short, the perfect antithesis of herself. It is curious, in such a case, to see the one lively, clever, restless, perhaps irritable, while the other is so much the reverse. Often it hardly appears a friendship at all—the one chafing, as it were, against the dulness of the other; this other, again, to all appearance suffering much from the impatience of her companion. And yet they never separate; so that we cannot doubt that it is a real friendship, the very fitness of which rests in that opposition of qualities which might be supposed to be its bane.

The indifference or repugnance so often shown by one pretty woman towards another, is usually accounted for on the ground of rivalry. But we so often see similar results where rivalry is not presumable, that I believe it may be owing to some deeper spring of feeling in our nature, of which the sentiment of rivalry is only one of the outward appearances. It will be found that two pretty women will be more apt to like each other, if they are of different styles of beauty: the one fair, perhaps; the other dark. This shows that it is not competition for admiration which wholly animates them. So, also, they will form a friendship if they be different in manners, temper, and deportment. In some rare instances, there may be a mutual regard where there is both a community of beauty, and of temper, and deportment; but always, in such cases, some striking discrepance will be detected in another quarter. *Only one will be lively and talkative*, the other being gentle and grave, demure or languishing, as the case may be. The friendship will then be founded not on the general parity, but the one disparity. The rule will still hold good.

Let us suppose two such friends exposed to the election of the other sex. Fully sure may we be that the man who loses his heart to the one, will see no charm in the other. Your grave or reserved, silent or sensible, stupid or timid wooer, invariably takes to the bright animated beauty, who will talk for herself and for him; the gay, good-humoured, rattling suitor, prefers her who will reward his sallies with a passive smile, and love the sound of his voice rather than her own. Happy for us that it is so! If the grave, silent man were to prefer a woman of like characteristics, what a stupid pair, what a sombre household would be theirs! If he of the social, volatile temperament could only find charms in one gay and witty as himself, which of them would be disposed for the sober forethought, the quiet daily duties, indispensable to the domestic comfort of married life?

In this latter relation, it is only difficult to determine whether in mental or personal characteristics husbands and wives are most often found to differ. What man of deep learning and science, for instance, ever takes to

himself a learned and scientific wife? Or rather, what sort of woman does he chose? Why, one who probably never opens a book, but who will see that his friends are well received, that his servants do their work, that the baker's bill is not overcharged, nor the leg of mutton over-roasted. So much for the cant of mental congeniality.

In personal attributes, what striking, what often ludicrous contrasts continually meet our view! For example, how seldom do little women find favour in the eyes of little men! On the contrary, take one of these latter, the most meagre, insignificant, unhappy-looking as to all outward bearing, and then turn to the portly, jolly, smiling dame to whom he has united himself! Look at another, to whom nature has tried to make amends for want of height by such a liberal share of breadth and rotundity, as gives him much the *tout ensemble* of a squat decanter or a beer barrel. If you hear such a man talk of his wife, be prepared to see one of those tall, slender, gossamer figures which some people designate graceful and elegant, and others liken to lathe and thread-paper.

That little women are almost always the admired and chosen of tall men, is, I believe, generally admitted. The taller the husband, it would almost appear that the more kindly does he look down upon feminine diminutiveness. There is also a characteristic gentleness in great robust men. How often, therefore, do we meet a man of towering stature linked to a female hardly reaching his elbow, and are told, moreover, that he is the most attentive and obedient of husbands! This does not, however, apply to your majestic race of men indiscriminately. All of them have, beyond doubt, a prepossession in favour of little wives; but it is not all who choose to be governed by them.

How seldom do we see a very handsome man married to a very beautiful woman! Never, we might say, except in the pages of a novel, where the hero and heroine must have of course their rightful portion of personal charms. On the contrary, we often behold these latter united to downright ugliness. But then there is wealth, or worth, or talent in the opposing scale, which is always observed to be the influential one; for mere beauty—by which we mean a faultless regularity of figure and features—is almost invariably accompanied with that complete insipidity which requires to be acted upon by a nature stronger than, and superior to, its own. We far oftener see it allied to this characteristic than to affectation and conceit; these belonging to a different, and inferior class of pretenders.

Our principle may be said to be developed in every friendship, partnership, and coalition voluntarily formed between those who have to act together on the stage of life. There may be equality as regards outward station and abilities, but never can there be resemblance in disposition or intellectual characteristics. In every era of man's existence the principle is inherent. We see it in the mere schoolboy or college youth, and we perceive it in the different classes and callings of life, civil or military, where mankind are thrown into collision, and the individual pretensions of each are tested.

In our sentimental faculties generally, it will be found that any one which becomes prominent in the character, shrinks from the active exercise of the same faculty in others. For instance, a person possessing much of the venerative principle, does not like to be made an object of worship. He is comfortable while allowed to look up to his great men; but make a great man of himself, and he becomes uneasy. Flattery, and a great show of deference, are to such a man unusually distasteful. It is for the very same reason that one possessing a large endowment of the opposite quality—self-esteem—shrinks from another like himself. In like manner the acquisitive man has always a great dislike—quite irrespectively of pecuniary detriment to himself—to become a subject for the exercise of acquisitiveness in others. It is an old and familiar remark, that those who are much given to jesting at the expense of their fellow-creatures, exhibit a peculiar dislike to be made the subject of jokes by others. This, I am persuaded, is from no ultra-sensitiveness of nature connected with the jest-loving character, but a curious reflex action of the leading faculty, causing it to be as painful in the passive, as it is agreeable in the active voice. Hence it is that your noted wits never shine in the company of men like themselves, and that a dinner-party where an effort has been made to bring a plurality of them together, usually proves a failure. If it ever be found that two witty men do agree well, and promote the general hilarity, examine them narrowly, and you will discover some great difference between them—one perhaps a biting satirist, the other a good-natured humorist—so that the apparent exception only confirms the rule. Assuredly two wits, both alike of either the first or the second kind, never yet were seen to spend an hour amicably together. And if two humorists of the other kind were brought together, it is ten to one that they would afterwards speak of each other as the perfection of dulness.

Reverting to matrimonial alliances, some interesting consequences arise from the principle of contraries on which partners are usually chosen. Where an alliance of this kind has been happy—to which it is equivalent to say, where it has been founded upon affection—it will be found that each party has a certain degree of preference for such of the children as resemble the other. A father of tame character, who has chosen an energetic wife, will best love the children who, like her, are energetic. If he has a beloved partner of complexion and general aspect very diverse from his own, he will be apt to make favourites of the children who resemble her in these respects, while comparatively indifferent to such of the young people as are copies of himself. It is doubtless from a similar principle that fathers are observed generally to prefer their daughters to their sons. The man-nature delights in the feminine gentleness, because its own opposite.

Perhaps it might not be thought very fanciful to suggest a final cause for all this seeking of opposites, in the need that has been contemplated for producing a diffusion of all the various qualities of families, of races, and of human nature generally, throughout the constitution of society. Sir Walter Scott, who had a great deal of a natural kind of philosophy, arising from the observation of his sagacious mind, makes some remarks to nearly the same purpose, with which I shall conclude my lucubrations. 'As unions,' he says, 'are often formed betwixt couples differing in complexion and stature, they take place still more frequently betwixt persons totally differing in feelings, tastes, in pursuits, and in understanding; and it would not be saying perhaps too much to aver, that two-thirds of the marriages around us have been contracted betwixt persons who, judging *a priori*, we should have thought had scarce any charms for each other. A moral and primary cause might be easily assigned for these anomalies in the wise dispensations of Providence—that the general balance of wit, wisdom, and amiable qualities of all kinds should be kept up through society at large. For what a world were it, if the wise were to intermarry only with the wise, the learned with the learned, the amiable with the amiable, nay, even the handsome with the handsome! And is it not evident that the degraded castes of the foolish, the ignorant, the brutal, and the deformed (comprehending, by the way, far the greater portion of mankind), must, when condemned to exclusive intercourse with each other, become gradually as much brutalised in person and disposition as so many orang-outangs? When, therefore, we see the "gentle joined to the rude," we may lament the fate of the suffering individual, but we must not the less admire the mysterious disposition of that wise Providence which thus balances the moral good and evil of life; which secures for a family, unhappy in the dispositions of one parent, a share of better and sweeter blood transmitted from the other; and preserves to the offspring

the affectionate care and protection of at least one of those from whom it is naturally due. Without the frequent occurrence of such alliances—mis-sorted as they seem at first sight—the world could not be that for which Eternal Wisdom has designed it—a place of mixed good and evil—a place of trial at once and of suffering, where even the worst ills are chequered with something that renders them tolerable to humble and patient minds, and where the best blessings carry with them the necessary alloy of embittering depreciation.'*

NOTHING IS USELESS.

We are told by old-fashioned economists to keep a thing nine years, and in the end we shall find a use for it—a maxim which receives striking confirmation from the recent progress of the useful arts. Things which, so lately as the commencement of our journal, were laid aside as useless, have now become of value; and substances which at one time were looked upon as positive annoyances and obstructions, have been turned to advantage. We mean to adduce a few examples in illustration of this fact—a fact doubly gratifying, as bearing not only upon what has been thus acquired, but as pointing to every other object in nature, however worthless in the esteem of our present ignorance.

Turning in the first place to agriculture, which, within the last twenty years, has made astonishing progress, we are met at every step with evidences of the fact that nothing is useless. Before the present century, the bones of animals were used to a small extent in turnery and other arts; but the great mass of them was thrown aside as offal, fit only to be buried out of sight. Now, every scrap from kennel and kitchen is carefully collected; mills have been erected in various parts of the country for crushing them; and in this state they are regarded as one of the finest manures for light turnip soils. So great has the demand been for this material during the past fifteen years, that it is imported from foreign and even distant countries; and of late considerable difficulty has been experienced in obtaining a supply. At present, we believe, the price of bone-dust ranges from 20s. to 25s. per imperial quarter—a price so tempting, that adulteration with slaked lime, sawdust, and the like, is not unfrequently resorted to. How our forefathers would have laughed at the prediction of bone-mills, and British soil fertilised with ship-borne bones from Germany and Prussia! The same may be remarked of soot, night-soil, urine, and the waste substances which used to flow from gas-works, and from the factories of the soap-boiler, the sugar-refiner, and others. Not many years ago, these were wholly, or almost wholly, neglected—looked upon as nuisances to be got rid off; now, they are carefully collected, and bring remunerating prices. A story is told that the magistrates of Edinburgh, some century and a half ago, were so thoroughly at a loss what to do with the refuse and offal on the streets, that they felt grateful, if they did not even proffer a reward, to a neighbouring laird for carting it off to his land! The worthy magistracy, however, were not more ignorant in their corporate than other people were, at a much later period, in their individual capacities; for most of the substances now valued as manures were then nuisances and obstructions. Soot, then thrown to the winds, is now carefully bagged, and sold at so much per bushel; urine, and other liquid, for which the farmer used formerly to dig a sewer, that it might be carried away from his farmstead, is now tanked, and poured over his land; the *urate* of commerce is but a mixture of urine and calcined gypsum; and night-soil is now extensively prepared with gypsum or lime, put in casks, and sold under the name of *poudrette*. The blood, lime, and animal charcoal, which had served the purposes of the sugar refiner, used to be thrown aside as waste; now, in the south of France, it is sold under the name of 'animalised charcoal,' and has, according to Professor Johnstone, risen to such a price, that the sugar refiners actually sell it for more than what the unmixed blood and animal charcoal originally cost them! Guano, though long used by the Peruvians as a manure, was disregarded by us till within the last eight or ten years. In 1830, a shipowner would much sooner have loaded his vessel with profitless ballast than with this substance; and yet, in 1845, its importation gave employment to a large portion of our mercantile navy, and every rock and islet of the Pacific and Atlantic was visited, lest, happily, a few hundred tons of this deposit might reward the search. Though now reduced to L.8 or L.10 a ton, seven years ago its price was more than double that sum; and this, be it observed, for a substance which in our boyhood had no mercantile value whatever. The ammoniacal liquor of gas-works, which used to be carried off by covered drains as a nuisance, is now sold to the farmer at so much per gallon. And so rapid are revolutions of this kind, that a gas company, which, to our knowledge, paid several hundred pounds to obtain sewerage for this article, would now reckon it waste to let a single gallon pass that way. And so will it shortly be with the sewer-water of our large cities, to which our ancestors never directed a thought, but which is at present engaging the attention of the scientific, that it may be converted into a source of wealth, instead of being, as it has hitherto been, a source of nuisance and disease.

Nor do we need to look to agriculture alone for illustrations of our maxim: mining and metallurgy are equally rich in examples. Cobalt, which yields the valuable blue pigment of that name, was for ages accounted a very troublesome article to the miner; copper pyrites, the common available ore in England, was, till recently, thrown aside as rubbish by the miners of South America. Mr Darwin, speaking of the Chilian method of mining, observes, that 'the two principal improvements introduced by foreigners have been, *first*, reducing by previous roasting the copper pyrites, which, being the common ore in Cornwall, the English miners were astounded on their arrival to find thrown away as useless; *secondly*, stamping and washing the scoriæ from the old furnaces, by which process particles of metal are recovered in abundance. I have actually seen mules carrying to the coast, for transportation to England, a cargo of such cinders. But the first case is much the most curious. The Chilian miners were so convinced that copper pyrites contained not a particle of copper, that they laughed at the Englishmen for their ignorance, who laughed in turn, and bought their richest veins for a few dollars. It is very odd that, in a country where mining had been extensively carried on for many years, so simple a process as gently roasting the ore, to expel the sulphur previous to smelting it, had never been discovered.' At the beginning of the present century, the black-band ironstone—which has added an unknown value to the west of Scotland, and materially influenced the iron-trade of the world—was treated as so much rubbish: no iron-founder would have taken a gift of it. 'For several years after its discovery,' says Mr Mushet, to whom the credit of first employing the black-band is due, 'this ironstone was confined to the Calder iron works, erected by me in 1800–2, where it was employed in mixture with other ironstones of the argillaceous class. It was afterwards used in mixture at the Clyde iron works, and, I believe, nowhere else. There existed on the part of the iron trade a strong feeling of prejudice against it. About the year 1825, the Monkland Company were the first to use it alone, and without any other mixture than the necessary quantity of limestone for a flux. The success of this company soon gave rise to the Gartsherrie and Dundyvan furnaces, in the midst of which progress came the use of raw pit coal and hot-blast—the latter one of the greatest discoveries in metallurgy of the present age, and, above every other process, admirably adapted for smelting the black-band ironstone. The greatest produce in iron-furnace, with the black-band and cold-blast, never

* 'The Pirate,' chapter xiii.

exceeded sixty tons a-week; the produce per furnace with hot-blast now averages ninety tons. Instead of twenty, twenty-five, or thirty hundredweight of limestone, formerly used to make a ton of iron, the black-band now requires only six, seven, or eight hundredweight for the production of a ton. This arises from the extreme richness of the ore, when roasted, and from the small quantity of earthy matter it contains, which renders the operation of smelting the black-band with hot-blast more like the melting of iron than the smelting of an ore. When properly roasted, its richness ranges from sixty to seventy per cent., so that little more than a ton and a half is required to make a ton of iron.' Here was an *El dorado* for our country; and yet, when the present century commenced, no man regarded it; nay, it is only about twenty years since any company was found bold enough to use it without admixture with other ores! The same remarks apply with equal force to *anthracite*, or non-bituminous coal, which, ten or twelve years ago, was known only by the depreciatory names of 'stone-coal' and 'blind-coal.' In our own country this anthracite occupies about one-third of the mineral basin of South Wales; it is found also in France, Austria, Bohemia, and Sardinia; and it constitutes the great bulk of the North American coal-fields, whose dimensions are computed at eighty thousand square miles—about sixteen times as much as the coal-measures of all Europe. At the time we mention, any of these countries would have gladly exchanged its supply of anthracite for a single seam in the Newcastle coal-field; but now, by the application of the hot-blast in iron-smelting and founding, the 'stone-coal' of our fathers is employed with as great facility and success as the best bituminous coal. In 1840, at a dinner given at Pottsville, Pennsylvania, by W. Lyman, Esq., on the occasion of his having successfully introduced the smelting of iron with anthracite, Mr Nicolas Biddle, who attended to witness the result of the experiments, after expressing his entire satisfaction in their success, thus observes:—'And this, after all, is the great mystery, the substitution of what is called the hot-blast for the cold-blast. Let us see the changes which this simple discovery is destined to make. As long as the iron ores and the coal of the anthracite region were incapable of fusion, the ores were entirely useless, and the coal nearly unavailable for manufactures; while, as the disappearance of the timber made charcoal very expensive, the iron of eastern Pennsylvania was comparatively small in quantity and high in price, and the defective communications with the interior made its transportation very costly. The result was, that, with all the materials of supplying iron in our own hands, the country has been obliged to pay enormous sums to Europeans for this necessary. In two years alone—1836–7—the importations of iron and steel amounted to upwards of twenty-four millions of dollars. It is especially mortifying to see that, in Pennsylvania, there has been introduced within the last seven years, exclusive of hardware and cutlery, nearly eighty thousand tons of iron, and that of these there were about forty-nine thousand tons of railroad iron, costing probably three millions and a half of dollars. Nay, this very day, in visiting your mines, we say, at the farthest depths of these subterranean passages, that the very coal and iron were brought to the mouth of the mines on rail-tracks of British iron, manufactured in Britain, and sent to us from a distance of three thousand miles.' Such was the state of matters in 1840; now, there are about one hundred anthracite furnaces in America; iron, lead, and copper are now produced in abundance, and exports, instead of imports, may be shortly expected. What wonderful results have thus been fanned into existence by a current of heated air! Even a use has been found for the iron dross or slag of the furnace, which is generally thrown aside as cumbersome refuse. This refuse, while in a fluid state, is run into iron forms, which are previously brought to a red heat by being placed so as to receive the superfluous flame which issues from the mouth of the furnace. The forms, with their contents, are then allowed to cool slowly by being placed in sand, just as glass is annealed to render it less brittle and more compact. By this procedure, it is asserted that the discoverer (a French mechanic) has succeeded in forming paving-stones, flags, large building blocks, and even pipes, of any given form, of a degree of hardness and polish equal to the best hewn natural granite, and at the most trifling cost conceivable.

The progress of chemistry likewise furnishes abundant evidence that nothing in nature is useless; in fact the whole history of the science is one continued exposition of the doctrine. To take a single example from Baron Liebig's Familiar Letters. Soda has been used from time immemorial in the manufacture of soap and glass—two chemical productions, which employ and keep in circulation an immense amount of capital. Till the present century, this substance was obtained from kelp, barilla, and the like, at great expense, and even in limited and uncertain quantities. Now, it is procured, to any amount, from common salt, and in this process muriatic acid is set free in abundance. 'At first,' says Liebig, 'the profit upon the soda was so great, that no one took the trouble to collect the muriatic acid; it ran to waste—it had no commercial value. A profitable application of it, however, was soon discovered: it is a compound of chlorine, and this substance may be obtained from it purer than from any other source. The bleaching power of chlorine has long been known, but it was only employed upon a large scale after it was obtained from residuary muriatic acid; and it was found that, in combination with lime, it could be transported to distances without any inconvenience. Thenceforth it was used for bleaching cotton, &c.; and but for this new bleaching process, it could scarcely have been possible for the cotton manufacture of Great Britain to have attained its present enormous extent: it could not have competed in price with France and Germany. In the old process for bleaching, every piece must be exposed to the air and light during several weeks in summer, and kept continually moist by manual labour. For this purpose meadow land, suitably situated, was essential. But a single establishment near Glasgow bleaches fourteen hundred pieces of cotton daily throughout the year! What an enormous capital would be required to purchase land for this purpose! How greatly would it increase the cost of bleaching to pay interest upon this capital, or to hire so much land in England!' And yet the object of this vast saving—this powerful aid to our manufacturing greatness—was, not many years ago, run into the nearest common sewer as a thing 'of no commercial value.' Nay, we believe the huge chimney stacks which have been erected within the last five years in Glasgow and other places, for the purpose of carrying off the deleterious fumes of the muriatic acid disengaged in the manufacture of soda, are now rendered superfluous, by the conversion of the acid into a mercantile commodity. So blind are we to the demands which the progress of the useful arts may make, that one year we lay out vast sums to get rid of a substance, which in the next we are careful to preserve as a source of pecuniary profit! Another example from the fertile field of chemistry, and we have done. It is known that a fleece of wool, in its natural state, is impregnated with greasy matter, which has to be got rid of, as far as possible, before it can be subjected to the ulterior processes of manufacture. This necessary purgation is undertaken by the woolwashers. The waters through which the wool is passed and purified become necessarily the receptacle of all the fatty stuff thus discharged. The habit with the woolwashers has been to throw away these greasy washings as worthless—if in country districts, to the pollution of the neighbouring streams; and if in towns, to the nuisance of the streets and thoroughfares. In summer-time and hot weather, the decomposition and pernicious exhalations of those washings become an exciting cause of disease in towns such as

Rheims, Elbœuf, &c. where the woollen manufactures of France are most largely carried on. Now, however, by an ingenious appliance, the evil may not only be obviated, but converted into a source of gain to the manufacturer, and healthy profit to the public. By the simple addition of a certain quantity of potash and slacked lime, M. Pagnon-Vautrin has obtained the saponification of the greasy washings, and employs the soap so formed for scouring the fibres or threads of carded wool—thus making, as it were, the fleece scour itself.

Such are a few illustrations—and they could be extended almost indefinitely—of the old-fashioned maxim with which we headed this paper. We know of no fact in our economical progress more gratifying than that we should, within such a brief period, have converted to our use, comfort, and pleasure, so many substances hitherto considered as useless, or even as detrimental. Nor does its bearing end here; it points as hopefully to the future, bids us regard nothing in nature as worthless, and warns us to throw nothing aside until we have exhausted our ingenuity to turn it to advantage. And even then the history of the past must compel us to admit that we have failed in our efforts only for the present, and that a time will come when the rejected object shall assume its value. If the last quarter of a century has furnished us with more illustrations of our maxim than any former period, it is only because human energy and invention has, during that time, been more vigorous and more sustained. There is scarcely any difficulty that the human intellect may not conquer, provided thought—vigorous, concentrated thought—be directed towards it; and it is mainly for want of this that so many objects lie worthless or unimproved around us.

THE PATH OF DUTY—A TALE.

BY ANNA MARIA SARGEANT.

The little town of B—— could not boast of a more worthy, upright, and truly respectable individual than was Richard Harley, though the station he held was no higher than that of a retail trader. His wife had, according to the judgment of her family, degraded herself by the union. She was a gentlewoman by birth and education, and, though without fortune, might have looked for a higher match; yet she was never known to regret the choice she had made. Mr Harley, on the other hand, had no reason to repent having selected her for a partner; for to her lady-like accomplishments she added those domestic virtues which can alone make the married life happy. A numerous family sprung up around them, and as the profits of the business were not great, they were consequently obliged to live in even a less expensive style than that in which they commenced their conjugal career. This course was, however, cheerfully embraced by Mrs Harley, as well as by her husband, notwithstanding that she had been accustomed to what might comparatively be deemed profusion. Her firm and well-balanced mind rose superior to the paltry pride of station, and she dared to act in accordance with the dictates of prudence, however liable she thereby became to fall out of the notice of those with whom she associated.

Death having deprived them of two of their children, the family, at the period at which we introduce them, consisted of two sons and four daughters. Edmund, the eldest, who was just verging on twenty, had from his early youth been distinguished for studious habits, and, as he grew older, displayed talents which attracted the attention of the pastor of the religious community of which his parents were members. Mr Harley's circumstances not allowing him to give his son an education which would fit him for the clerical profession, Mr Morland had generously offered to become his instructor till he should attain the age at which he might be admitted to one of the colleges. This offer had been accepted with gratitude by the father, as well as by the youth himself; and had not some untoward circumstances occurred to throw a temporary barrier in the way, he would have earlier removed to one of those seats of learning to which his wishes had long been earnestly directed. To do justice to the character of the young student, it must be told that ambition had no share in his choice of a profession. He would have been satisfied to tread in the same path which his father was pursuing, deeming it to be no less truly respectable; but he was at the same time conscious of powers which, if rightly directed, might enable him to be more extensively useful. He was far from despising the calling of the tradesman, yet shrunk from the idea of spending his days with no higher aim than that of realising an income or amassing a fortune. Widely different were the feelings of his brother Richard, who, though possessed of his father's name, unhappily did not inherit his virtues. This youth entertained a still greater repugnance to the pursuit of trade, but from motives as low and false, as those of Edmund were elevated. His dislike arose from the application and confinement it necessarily demanded, to which his indolent habits were opposed. He had, moreover, become acquainted with a set of dissolute young men, who were his superiors in station, and who encouraged the notions he had adopted—that it was derogatory to a youth of spirit to be chained behind a counter, and that a living might be earned in a much more genteel, and, at the same time, easy manner.

Richard was angry that the leisure was afforded his brother for study, and jealous of his prospect of occupying a higher position in society, yet had neither the desire to improve his own education, nor the talent to fit him for any profession. He vehemently opposed the plan marked out by his father, which was to bind him as an apprentice to his own business: but Mr Harley, though a kind and fond parent, was peremptory when prompted by a sense of duty, and he would not suffer the futile objections of the youth in this instance to move him from his purpose. The education of the girls wholly devolved on Mrs Harley; and, with this exception, that her health was delicate, never was mother better suited for the task. She herself exemplified how possible it is to unite the taste and refinement of a polished mind with the homely offices of domestic life; and under the tuition of such a woman, her daughters promised to become all that an amiable and right-minded parent could desire. Elizabeth, the eldest, though only seventeen, was already a considerable assistance both in the domestic economy and in the education of her younger sisters. The misconduct of Richard, who, on being opposed in his wishes, grew even more self-willed and ungovernable, was for many years the only disturbance to the peace of this otherwise happy family: but a trial awaited them at this period which was altogether unlooked for, and consequently harder to endure. This was the serious illness, and subsequent death, of the beloved and venerated father. Mr Harley, a short time prior to his decease, foresaw the fatal termination of his malady, and felt it right to prepare, as far as possible, against the ills it would bring upon his hitherto dependent family. He professed not the indifference of the Stoic, and he was not without anxieties on their account; but calling to his aid that fortitude which seldom forsakes the Christian in his hour of extremest need, he resolved to advise them for their welfare, and then leave the event in the hands of Him who has promised to be a father to the fatherless and a husband to the widow.

Owing to the extreme youth and unsteady conduct of his youngest son, Mr Harley could not leave his business to his care; yet it was the only means of support to the family. All his hopes, therefore, rested on Edmund, who, in order to provide for his mother and sisters, must yield up the prospects he had so long and so fondly indulged. The father felt it would be a sacrifice of no ordinary kind; but such was his confidence in the affection and principle of the young man, that he

did not doubt he would unhesitatingly make it. He one evening communicated his thoughts on this subject to his gentle partner, who occupied her accustomed seat by his bed-side. 'Heaven only knows whether my death may produce a change in Richard,' he added with emotion; 'but we must not build upon so insecure a foundation. You do not speak, my love. What am I to infer from your silence?'

Mrs Harley's tears flowed fast as she replied 'that she had formed a project, in the event of his death, to commence, with Elizabeth's assistance, an establishment for tuition.'

'Such a plan bespeaks my own right-hearted Clara,' said the husband, pressing the hand he held more closely between his own; 'but there are objections to it. Your health is delicate; our three youngest children are not of an age to render any assistance; and the expenses of such an establishment as you are capable of undertaking would be considerable. What, then, will become of the business which has afforded us a competence for one-and-twenty years? No, my love, I see but one clear and prudent path. It will be a sacrifice to our feelings as parents, as well as to those of our son; but I am confident that I have only to point out to him the path of duty, and he will, for your sake, give up even this long and fondly-cherished hope.'

'And you have rightly judged, my father!' exclaimed the young man, who had entered the apartment unperceived, and thus become an unintentional listener to the latter part of the conversation. 'It is true,' he pursued, throwing himself on his knees beside the bed, and devoutly pressing the hands of his parent to his lips—'it is true that I have long cherished the idea of adopting another calling, and it requires a strong effort of self-denial to yield it up; but what course can be so acceptable to God, as that which is undertaken against our inclination from a sense of duty?'

Mr Harley did not survive many days; but the promise of his high-principled son was a source of unspeakable satisfaction in his dying hours. Death is at all times solemn, and when it takes the father from the midst of his children, and makes the wife a widow, it causes a chasm which cannot easily be filled up. Mr Harley's loss was, however, felt beyond his family circle; for though his sphere of action was not large, his Christian philanthropy had extended to its utmost bound.

When the opening of the will disclosed that the business was made over to Edmund, Richard, notwithstanding the dislike he so often expressed to what he termed the degradation of a retail shop, manifested the most violent anger. One clause, in particular, offended his pride and aroused his indignation. This was an injunction for him to fulfil the term of his apprenticeship to his brother, and to act in such a manner that Edmund might, at the expiration of that term, be justified, by prudence, in receiving him as a partner. 'My father has always treated me with injustice, and preferred my brother,' he passionately exclaimed; 'and now he has carried his injustice with him to the grave.'

'Oh, Richard, yours are the first lips that ever coupled your father's name with that term, and you will live to repent it,' cried Mrs Harley, casting on the youth a look of mingled tenderness and reproof.

'Be calm, my brother,' Edmund gently interposed; 'you are not at present in a state of mind to see how much you wrong both the living and the dead. This arrangement was intended for the general welfare of the family, and as you value our peace, and, above all, the peace of our dear remaining parent, I beseech of you not to add to our affliction by expressing dissatisfaction.'

'It is well for you to talk of peace and satisfaction,' Richard sneeringly observed; 'you in whom all the power is vested. But I tell you, Edmund, that though I served my father, I have no inclination to serve a brother—a brother scarcely three years my senior; nor will I do it.'

'We will not dispute the matter now; only let me beg of you to do nothing rashly,' Edmund quietly rejoined, and Richard, turning abruptly from him, hastily quitted the parlour. Mr Morland, who was present, now came forward to offer consolation to the afflicted mother. 'We will hope, dear madam,' he said, 'that, the first ebullition of anger over, this refractory youth will not persevere in his rash determination. Take comfort from the dutiful and affectionate conduct of your other children. Edmund has risen tenfold in the esteem of every right-thinking person by the noble part he has acted. My dear young friend,' he pursued, taking the hand of the young man, 'I congratulate you on the conquest you have made over self—congratulate you with greater pleasure than I should feel had you attained the object of your most ardent wishes. I can fully appreciate the sacrifice you have made, for in my youth I endured a somewhat similar trial. Providence afterwards cleared my way, and yours may possibly, at some future period, be in like manner opened. But if it should not be so, believe me that you will enjoy more real satisfaction whilst pursuing the straight path of duty, however opposed it be to your habits and inclinations, and however humble, than even the gratification of laudable desires can afford if lying out of that path.'

Edmund could only return the warm pressure of his venerable friend: his emotions were too powerful for utterance.

'If,' Mr Morland proceeded, 'your conduct towards your brother be marked by as much wisdom and forbearance as that towards your mother and sisters is by generosity, we may yet see him a worthy member of society. He is not, I hope, wholly lost to feeling, and kindness may overcome where harshness would fail. But I have no need,' he added, 'to point out the proper means to be pursued to those whose hearts are already willing to overlook offences. I have reason to believe that one is beforehand with me, and is even now endeavouring to act the part of a peacemaker.' The moment after Richard had quitted the room, Elizabeth had quietly left the place she had before occupied by her mother's side, to follow the youth, and her errand had been rightly surmised by the good pastor. If any member of the family could subdue the violent spirit of Richard Harley, it was his twin-sister, for whom his affections were called forth in a stronger degree than for any other being on earth. They had been playfellows in childhood; for Edmund had always been too studious a companion for his brother, and the other children were many years younger. Though a greater contrast could scarcely be imagined than that which existed in their dispositions—Elizabeth being as gentle and yielding as Richard was exacting and self-willed—that very circumstance tended to unite them in a closer bond. It gave occasion for forbearance in the former which the latter could not but admire; though he made no effort to imitate it, and often taxed it beyond all reasonable bounds.

The affectionate sister found, however, that to soothe the youth under his present imaginary injury, was the most difficult task she had undertaken, he having predetermined not to sleep another night under the parental roof; but she would not quit his side till she had won from him a promise that he would not act precipitately in the affair, but at least wait the event of a few days, till he saw the course Edmund intended to pursue.

Though Elizabeth was tenderly attached to her younger brother, she entertained a still warmer affection for the elder, towards whom she felt a kind of love bordering on veneration. She had ever looked up to him as to some superior being, whose counsel she could ask in every difficulty, and whose decisions were faultless. She now confidently hoped that the lenity of the one would effectually overcome the anger of the other; and with this comforting assurance in her own bosom, she sought her widowed parent, and strove to console

her under her present aggravated griefs. One of the greatest trials which human nature is called to endure, is to have our motives questioned, and our good evil-spoken of. Thus Edmund suffered more from being taunted with selfishness, when he had really exercised the most noble generosity, than he did from the sacrifice he had made. But a still severer pang yet awaited him.

Our hero's frequent visits to the house of Mr Morland had brought him into constant and familiar intercourse with that gentleman's only daughter, a lovely girl of nearly his own age. They had been associated in study; for her father was of opinion that women are born for nobler purposes than either to be mere domestic drudges or puppets for exhibition, and had consequently resolved to train her in a manner which would really fit her to become the companion of a man of education. He was at the same time solicitous that she should lose none of the truly feminine characteristics of her sex; and had Mrs Morland co-operated in his laudable undertaking, it is most probable that he would have accomplished the desirable end he had in view. But, unhappily for the domestic peace of the good pastor, as well as for the formation of the character of his daughter, that lady studied rather how her beautiful child might obtain admiration, than how she might become worthy of it, and thus counteracted the good effects which her father's example and instructions might otherwise have wrought. To the eyes of the young student, however, Ellen Morland appeared faultless; and he, with the evident sanction of her parents, as well as with the approbation of the young lady herself, bestowed on her the warmest affections of his ardent nature. To the good pastor the union appeared desirable, from his knowledge of the character of the young man. Mrs Morland did not oppose it, because she was of opinion that his talents would raise him to distinction in the profession he had made choice of; and Ellen was flattered and gratified with the devotion of one possessed of so superior a mind, combined with a person far from disagreeable. Under such circumstances, it is not surprising that the intelligence that Edmund had relinquished the idea of entering the ministry, in order to provide for his mother and sisters from his late father's business, had a very different effect upon the minds of the mother and daughter to that which it created in the father. The former were incapable of appreciating the generosity of the act, and only saw in it the blighted prospects of the young man. Ellen, however, said not a word in her father's presence; and Mrs Morland, finding that her husband's views of the subject were not in accordance with her own, forbore to make any remark, though she secretly determined that the acquaintance between the young people should be speedily brought to a close.

'That moment in which Mr Edmund Harley ties on a canvas apron, and appears in his shop, he breaks every tie between us,' the young lady exclaimed as the pastor quitted the room; and as she spoke, she scornfully tossed her pretty head, and indignantly threw down a silken watch-chain which her fair fingers had for some time been busily occupied in weaving for the youth.

'I am happy to find that your feelings correspond with my own, my dear Ellen,' the mother observed. 'I was afraid that your affection for this foolish young man might induce you to overlook his position in society.'

'Affection might have induced me,' said the daughter, 'to overlook his station in society, had the business he is about to engage in been almost any other than what it is; but to stand behind a counter with that odious apron—oh! I could not endure it. You need not entertain the least apprehension on that head, mamma.'

'And what will avail all the pains your papa has taken to teach him Hebrew and Greek, if he is to spend his days in weighing butter and cheese?' said Mrs Morland. 'For my part, I think it is very ungrateful in him to throw away such advantages on such a pretence; for I can't give him credit for disinterestedness, when a profitable business is to be the reward of his self-sacrifice.'

'The sacrifice would not be to him alone, if I were to share his fortunes,' Ellen quickly rejoined; 'for the change would be far greater to me, who have always moved in a different sphere, than it can be to him. I think that he ought to have consulted me on the subject before he gave such a promise to his father.'

'Well, my love, it is not a matter for very deep regret. I hope you have a higher destiny marked out for you than to be the wife of a cheesemonger's son; and I am glad that you have sufficient prudence to see it in the right light.'

Though the young lady affected so much indifference at the prospect of yielding up her lover, she could not really resign him without a pang. She was angry that his affection for his parent and sisters had superseded what she considered to be due to herself; but could not help calling to mind his many virtues, as well as occasionally contemplating his personal and mental endowments. 'Mamma thinks I bear it more heroically than I really do,' she mentally said as she retired to the privacy of her own chamber to shed a few tears of regret.

Unsuspicious of what was passing at the house at which he had hitherto been a welcome guest, Edmund repaired thither as soon as the funeral obsequies of his departed parent were over. His warm heart anticipated sympathy from these his dearest friends. How great, therefore, were his surprise and disappointment when, instead of the customary affectionate greeting, he was received in as cold and distant a manner as though he had been a perfect stranger! As no reference was made to the new position which he was likely to hold, he never for a moment conjectured the cause of the altered behaviour of the ladies towards him; but on Mrs Morland being called from the room, he availed himself of the opportunity to seek an explanation. 'What can I have done to merit this treatment at your hands, dearest Ellen?' he tenderly asked, as he drew his chair beside hers, and looked earnestly in her face.

'You must be aware, Mr Harley, that we can no longer meet on the same terms we have hitherto done,' the young lady made answer; and as she spoke, she, to conceal her emotion, bent over a drawing to which she had been giving the last touches with her pencil.

'I am perfectly ignorant of your meaning, Miss Morland. I am not aware of having in anyway deserved to be received here otherwise than I have ever been.'

'Am I misinformed, then, upon the subject of your intentions for the future?' Ellen asked, with more earnestness than she intended to betray. The question served to open the eyes of her lover to the truth, and he was for some time incapable of reply, so powerful were the conflicting emotions which agitated his breast. 'Is it true,' she pursued after a pause, 'that you have relinquished your intended academic career, and purpose to take your station for life behind a counter?'

'Can this be Ellen Morland—she whom I believed to be all that was generous, affectionate, and amiable?' the youth mentally inquired. Still he spoke not, fearing lest his words should express all the astonishment and indignation he felt.

'If such be the case,' the young lady proceeded, at a loss how to account for his silence, 'you need not be informed that you have taken a step which must separate us for ever. I would have shared your fortunes in the honourable path you were about to pursue, even had you not been prosperous; but you cannot suppose, Mr Harley, that I can now any longer think of doing so. I do not expect that this will cause you any regret,' she carelessly added: 'your mother and sisters are the principal objects of your concern; my feelings and my wishes have not been consulted; and therefore

I am justified in deeming them a matter of indifference.'

'Had not your own lips, Ellen, given utterance to these unkind and unjust observations, I would not have believed you capable of making them,' the young man now replied, whilst his intelligent countenance glowed with an expression of anger foreign to his nature. 'I would have contradicted any one who had dared to accuse you of such selfish and unfeeling conduct; and even now I am almost inclined to doubt the evidence of my senses, rather than believe you guilty of it. Yes, I have, as you say, given up my academic career, and taken my station behind a counter; and your excellent father approves of the step. I have acted in accordance with the dictates of affection and duty, at a sacrifice of my own feelings which no language can express; and I expected to have met with your sympathy and approbation. But since it is withheld—since you are so void of womanly tenderness as to taunt me with my regard for my family, I will turn to them alone for that happiness I once thought you would be the means of bestowing.'

He rose as he spoke, and was moving towards the door, when Ellen, who had not expected on the part of her lover such a ready concurrence in her wishes, detained him by observing that she was the person who had most reason to complain, since he had treated her as though she was without interest in his welfare.

'No, Miss Morland,' he made answer: 'I supposed you to be deeply interested in anything that concerned me; but I was grievously mistaken; and this transaction has revealed to me that we were never suited for each other. If you can esteem the claims of a widowed parent and helpless family to be so light—if you can throw contempt upon an honourable occupation, undertaken under such circumstances—you would never have made me happy, and I, on the other hand, could not have rendered you so. It is well, perhaps, that we have thus become better acquainted with each other's character, though to me it is a bitter discovery. Adieu! I little thought when I entered this house that I should leave it thus;' and he again made a movement to depart.

Ellen would at that moment have given much to recall what she had, in the full confidence of her power, uttered; but her pride would not allow her to make any concession, and she suffered him to depart without a word. No language can describe the feelings of Edmund Harley as he bent his steps towards his once happy home. The hopes of his youth were in everyway blighted; yet he was free from self-accusations; nor did he in any instance repent of the course he had taken. There is an elevating principle in virtue which sustains the mind under every calamity, and this principle alone supported our hero under his accumulated disappointments.

Mrs Harley's penetrating mind had foreseen the probable event of Miss Morland's rejection of her son. She surmised that her affections were not of a very durable nature; but to the simple-hearted Elizabeth, it was a matter of astonishment that any young woman could be indifferent to the regard of her almost idolised brother, be his position in society what it might. The private sorrows of Edmund were, however, swallowed up in a fresh affliction, which befell the family shortly afterwards. The conciliating spirit evinced, and the generous offers which were made, by the elder towards the younger brother, had no effect in softening the resentment of the latter, who viewed with dissatisfaction every measure proposed for the promotion of peace and unity. He was missed one morning from the family breakfast, and when sought for in his chamber, it was discovered that he had not occupied it during the night. The fact that great part of his wardrobe was gone, too plainly denoted that he had voluntarily absented himself; but not a line could be found to give his distressed relations any clue to the path he had taken, or the course he intended to pursue, nor could they hear of any one who had seen him since the previous evening. The health of Mrs Harley, which had been greatly enfeebled by her late severe affliction, sunk under this additional grief, and she was confined to her chamber with a malady which threatened a fatal termination. It was now that the domestic virtues of Elizabeth were called into action. The management of the household affairs, and the charge of the younger members of the family, devolved on her, in addition to the task of nursing her invalid parent; but her character, unlike that of Ellen Morland's, required to be tested by adverse circumstances to exhibit its beauty.

Knowing the dislike Richard had for business, Edmund thought it probable that his brother had enlisted in the military service; and he accordingly took a journey to London, in order to ascertain if this were the case. He felt convinced that the strict discipline exercised in the army would be revolting to the pride of a youth who had resisted the mildest parental control, and he would have made any sacrifice to purchase his release, could he have persuaded him to return to his home. His search was, however, fruitless: no traces of the fugitive could be discovered, and the afflicted family could only wait the result of time.

The entire devotion of her eldest son, together with the unremitting attentions of her gentle nurse, had the effect of soothing the wounded spirit of Mrs Harley, and for their sakes she strove to bear her twofold bereavement. The desertion of Richard had thrown much additional labour upon Edmund, who, never having been habituated to business, found the duties really onerous. Shut out from those beloved studies which had before been the food of his existence, he toiled early and late at an occupation which even prevented the possibility of his thoughts ranging in those flowery paths; yet he was never heard to utter a complaint. When alone with Elizabeth, he would sometimes picture how happy he should have been had Providence permitted that he should have administered to the wants of his family by means of the sacred office towards which his wishes tended; but he would check every rising of discontent with the remark, that it was not his place to dictate, but to follow. His gentle sister's hopeful nature would soar above the present difficulties, and prophesy of brighter days. She was sure, she said, that his noble self-sacrifice would be rewarded even in this life; that he was not intended ever to pursue a course so opposed to his inclinations; and these visions of future happiness had at least the effect of smoothing his present rugged path.

The expiration of two years found the family in much the same circumstances as when Richard quitted his home—with this exception, that time had in some measure blunted the edge of their grief for the departed. Concerning the fate of the fugitive they were in equal uncertainty and anxiety, for no tidings of him had reached them during that period. The London post, however, one morning brought Edmund a letter, the direction of which bore a resemblance to his brother's handwriting, and, without saying a word which could indicate what was passing in his mind, he withdrew from the family circle to peruse it alone. The epistle, as he surmised, was from Richard; but Edmund scarcely knew whether to rejoice or to weep over its contents. It told a tale of suffering, and was dated from an hospital, where the unhappy young man was then lying, disabled by sickness, brought on by privation and hardship; but it breathed a spirit of penitence and submission he had never before evinced, and this gave some cheering hopes of future amendment. 'To you, my brother,' he concluded by saying—'to you I turn when all the rest of mankind frown upon me; for in you I see the representative of that excellent father whose counsels I despised, and whose name I slandered. Yes; I cannot forget that I taxed his memory with injustice, because he had not placed confidence in a son who had never acted other than the prodigal's part. My mother truly prophesied that I should live to repent it. But if

my life be spared, and you receive me once more into my early home, I will try by every means to make restitution for the past, by devoting my future life to the service of those remaining dear ones I have so deeply injured.' Summoning Elizabeth to his side, Edmund deputed to her the task of breaking the intelligence to their parent, and then made immediate preparations for paying a visit to his erring brother. To Mrs Harley the information came like a voice from the grave; for she had long deplored her son as dead, thinking it impossible that he could yet live, and keep them so long in ignorance of his fate. Our hero's intended journey to London meeting with his mother's cordial approbation, the young man was in a few hours on his road thither. His fraternal feelings experienced a shock when he obtained admittance to the house of charity in which the invalid lay; for so altered were those once handsome features, and so emaciated was his late athletic form, that he could with difficulty recognise him. There was a change also in Edmund: his intelligent countenance bore an expression of thoughtfulness and sadness unusual in one so young; but it was at the same time rendered more dignified by the ennobling motives which had actuated his conduct. The meeting was touching in the extreme. The contrition of one brother was evidently as deep and sincere as the forgiveness of the other was cheerful and heartfelt; and Edmund's assurances that their widowed parent would receive her prodigal son with open arms, afforded to Richard unspeakable satisfaction.

The debilitated state to which the youth was reduced, prevented the possibility of his being removed for some considerable time; but his family looked anxiously for his arrival at the home of his childhood, and no one more so than Elizabeth, who hopefully prophesied that her nursing would soon restore him to perfect health. At length he was clasped in the embraces of his fond mother and affectionate sisters who with one accord resolved to obliterate all remembrance of the past, and to encourage his resolutions of amendment.

'I do not ask you to place firm reliance in my promises of reformation,' Richard one day said, addressing his brother. 'The resolutions made on a sick-bed are, I know, often broken; but if, after twelve months' trial, I retain your confidence, I wish you to intrust the business to my care, and then pursue the course you had at first marked out. Believe me,' he earnestly added, 'I am not prompted by self-interest in making this proposal. I am now convinced that it was at a sacrifice of your feelings that you undertook it; and in requesting you to give it up, I am influenced only by a desire for your benefit. I will willingly yield the entire profits to my mother and sisters, and derive no further emolument from it than as if I were a stranger hired to fill your place.'

Edmund cheerfully acceded to this proposition: it seemed to animate him with fresh hope; and Elizabeth, who was present, threw her arms alternately around each, and wept tears of delight. 'Did I not tell you, dear Edmund, that there would be a blissful termination to all our misfortunes?' she exclaimed. Then turning to her younger brother, she energetically added, 'On the fulfilment of your promises, Richard, all our hopes must rest. But you will fulfil them—I am sure you will. You will, for the future, be to our dear mother what Edmund has hitherto been. He may then pursue his studies, and we shall all be happy yet.'

And Elizabeth's prophecy was accomplished—her fondest hopes were realised; for Richard's good conduct during the period he had himself specified having guaranteed future stability, the business was consigned to his care. Mrs Harley thought it most prudent, for a season, to permit him to have it on his own terms; but as he gave no cause for dissatisfaction in the capacity of foreman, it was wholly intrusted to his direction shortly after he became of age. Edmund, meanwhile, with the aid of Mr Morland—who, notwithstanding the rupture with his daughter, was still his attached and steady friend—recommenced his studies in one of the colleges, and having gone through the necessary course, attained the goal towards which his desires had so long been directed. He was now able to offer his widowed parent and younger sisters an asylum beneath his roof, leaving Elizabeth to be the housekeeper of her twin-brother. The furnace of affliction had further purified the character of Edmund Harley, and he entered on his sacred office with a mind better prepared for extensive usefulness than it would formerly have been. And now, in looking back upon the past, he is led to see that, though 'the path of duty' was in his case rugged and toilsome, it was the only safe one, and that it had ultimately led to solid and durable happiness.

AN EASTER RAMBLE IN THE NETHERLANDS.

SECOND ARTICLE.

EASTER SUNDAY IN ANTWERP—CATHEDRAL SERVICE—INCONGRUITIES DURING MASS—INTERIOR PLAN OF CATHOLIC CHURCHES—MAGNIFICENCE OF THE ANCIENT CATHEDRAL—OPULENCE OF ANTWERP—QUENTIN METSYS' CURIOUS HISTORY—CATHEDRAL SPIRE—COMPLIMENT PAID TO QUEEN VICTORIA.

THE Easter Sunday was ushered in, or rather we were awakened, by the confused ringing of church bells, amidst the din of which we could distinguish the softer tones of the Carillon—a description of chiming which is carried to great perfection in Holland and Belgium. It was a bright sunny morning, and the Place Verte, or piazza, underneath our windows already presented a lively scene, being thronged with people hastening in different directions to their respective churches. Continental habits beget early hours. The Catholic religion enjoins its disciples to rise almost with the rising sun to their matins; and upon such festivals as the present—the *jour de pâques*—low masses precede high mass, and other masses follow until vespers, so that the whole day appears to be dedicated to divine service. And yet there appears to be a curious intermixture between these outward signs of religious worship and the visible continuance of the business of daily life; for while the churches are crowded, and the church bells still continue summoning the people to their devotions, the shops remain open in almost every quarter of the town for the casual incidents of trade; and the different promenades in the public squares and neighbourhood, as the day advances, become hourly more enlivened with fashionably-dressed persons, who appear to live only to enjoy the ephemeral gaieties of society. There is a contrariety in the effect so produced which is very remarkable, particularly in small towns like Antwerp, where the population and its resources are not lost in metropolitan magnitude, but come more immediately under the scope of individual observation.

The high mass in the cathedral commenced at ten o'clock in the morning, and our party were fortunate enough to obtain seats near the choir. The immense area of the church, as far as the eye could reach through the innumerable pillars which support the Gothic arches of the double aisles, was soon filled by a dense multitude; and as the priests entered in their rich sacerdotal habits, chanting the *introitus*, the deep and sustained notes of the organ, and the accompaniment of the other wind and stringed instruments blending their full chords together, announced with impressive grandeur the commencement of the mass. There was a rustling for a moment in the crowd. The priests then having bowed on each side of the altar, with their upraised hands pressed together, approached its centre, and commenced those mystical movements and ceremonies which may, to the uninitiated, have something of a mimetic appearance; yet it is far otherwise, for every action and gesture, and even attitude, is strictly prescribed by the Roman ritual, and intended to convey a meaning typical of some portion of the life and doctrines of our Saviour.* Hence one part of the service,

* Explication des Cérémonies de la Messe. Par Le P. Brun. Paris, 1844.

to those who participate in it, is more affecting than another; and occasionally individuals may be observed to become so much agitated, that they can hardly suppress their emotions. While the congregation was thus devoutly engaged, we could not help gazing with admiration on the very beautiful altar-piece before us—the Assumption of the Virgin by Rubens. The colouring of this picture is exquisite. The Virgin is represented surrounded by a choir of angels, and some light fleecy clouds hovering around them. There is a calm beatitude in the countenance of the Virgin, and a tenderness of feeling, which express in the most vivid manner a consciousness of the most perfect purity, conjoined and blending with a sense of the deepest adoration. The attendant angels, too, are conceived in a tone of matchless harmony; while the clearness and transparency of the clouds produce an aërial effect which is truly marvellous. It has been observed that Rubens, as a colourist, might be called 'the painter of light,' as Rembrandt, by way of contrast, has been described 'the painter of darkness;' and certainly there is a softness and subdued beauty in this picture which will not be found in any of his larger and more startling compositions. In all Catholic countries the sacred music which accompanies, or rather forms part of the mass, is finely executed; and upon this occasion—as the priests walked in procession down the nave, exhibiting over the heads of the people the Host in its golden ostensoir, while the heavy silver censers were swung aloft, throwing out clouds of incense—we thought we never heard the Hallelujah more fully, more impressively, and more effectively given. During the preceding—the Passion—week, the church service partakes of a desponding and dolorous character. At all hours of the day persons may be seen moving stealthily through the aisles to the confessionals, or small wooden stalls, in which the priest, through a window-like opening, listens to the confession of sins, and holds communication with the penitent. Morning, noon, and evening, the *De Profundis*, and other psalms of penitence, with the *Kyrie Eleison*, or Litany of the Saints, are lugubriously and somewhat monotonously chanted, until, upon Good-Friday, the celebration of the *Tenebræ*, to denote the darkness and other circumstances of the crucifixion, adds the deepest of all gloom to these prescribed offices. But on Easter Sunday, which is the 'highest of all feasts,' strains of more joyous harmony succeed, interspersed with the most charming symphonies, which are intended to console and cheer, and raise heavenwards the aspirations of the devout.

Ever restless and open to trivial impressions, strangers are apt, even amidst scenes of solemnity, to be struck by incongruities which other persons from habit do not observe; and we confess that upon this, as well as upon similar occasions, our ears were offended by an almost perpetual and most unseemly jingling of copper money. In Catholic churches there are no pews—which were not introduced into England until after the Reformation—and the congregation therefore is provided with chairs, having low seats for people to kneel as well as to sit upon. For the use of each chair, or '*prie Dieu*,' as it is called, every person pays two or three sous; and the collection of these coppers by a woman who watches with a quick eye every change of seat, goes on during the whole service. There are also two other collections, chiefly in copper money—one for the church, the other for the parish; and these donations being solicited in like manner, and dropped into a wooden box while the people are at their devotions, occasion a similar interruption. The chair money, particularly in large parishes, brings an enormous revenue to the church; they are generally farmed out to individuals, who profit by the speculation. We are informed that in one church alone in Paris—Saint Eustache—the return from letting out the chairs some years ago amounted annually to upwards of twenty thousand francs.* Here also we ought not to pass unnoticed a very important-looking personage, who never fails to attract attention—we mean the beadle or sacristan. In Paris, his costume is very remarkable. He wears a cocked-hat, trimmed with silver lace, an embroidered old-fashioned coat, knee breeches, and white silk stockings, with shoes adorned with huge silver buckles; and from a broad, highly-ornamented belt, suspended over his right shoulder, a dress-sword hangs dangling transversely across his calves. He carries a long silver-headed potential-looking cane, well ferruled at the tip, with which he strikes the stone pavement with a reverberating clink, as a signal for the people to make way for the priest as he passes from the sacristy to the altar or the pulpit. It was observed by Lady Morgan that this costume is remarkable for having remained unchanged amidst all the social revolutions which have occurred in the French capital. In Antwerp, this functionary appears in a less courtier-like garb, or, to speak artistically, in a more subdued attire. The silver-laced cocked-hat is dispensed with, as also the dress-sword; he, however, wears a finely-embroidered coat and breast-belt; and, what appears curious, instead of sporting silk stockings, his legs disappear in a pair of English-looking top-boots, the deep upper leathers of which are of a bright and shining mahogany colour. While engaged in his more sacred official duties, he did not fail to look out for the new faces of such visitors as might be present; and at the conclusion of the mass, as we were retiring from the cathedral, he followed us, and intimated that if we would return at one o'clock, he would uncover for our inspection the two pictures of Rubens—'the Descent from the Cross,' and 'the Elevation of the Cross'—which, in a spirit of unrighteous parsimony, were concealed behind a curtain, not so much to protect them from the dust, as to obtain a gratuity for their exhibition. We, however, for the present declined his offer; because, although the service was concluded, many of the congregation still retained their seats; and we observed that other religious ceremonies were commencing in some of the side chapels.

Here, in reference to these side chapels and other subdivisions of the Catholic church, we may explain, for the information of those who have not visited the continent, that the plan or interior distribution of these sacred edifices is for the most part similar. At the east end, in conformity with the ancient custom of praying towards the east, is the high altar; opposite to which, at the western extremity, is the organ; and the intervening open space, or middle of the church, is called the nave. On each side of the nave, flanking the walls, are the aisles, which are vaulted, and frequently, as in the Antwerp cathedral, supported by a triple row of pillars. On either side of these aisles are the chapels just mentioned, which are recesses or partitions against the walls, generally railed in and separated from each other. Originally, they were, in the primitive churches, designed for little cells or chambers, into which persons could retire for reading, meditation, or prayer; they now bear the name of the saint to which they are individually dedicated; and each is provided with an altar, and often adorned with interesting sepulchral monuments and very fine pictures. They are used for private worship; and the masses conducted in them—sometimes, but not always, with the assistance of a priest—are independent of the congregation which may be present. During high mass, the altars in these chapels are frequently seen lighted up with small wax tapers, and these more private ceremonies of devotion are at the same time going on. Across the nave runs a division north and south, called the transepts, which was added by the early Christians to the Roman church for the purpose of laying out the ground-plan in the shape either of a Greek or Roman cross. In the Greek cross, the four arms are equal; in the Latin, the arms are higher up on the trunk, so as to correspond more nearly with the proportions of the human body. Above the intersection of the transepts with the nave a dome is frequently introduced; and on each side of the choir a chapel,

* Veritable Origine des Biens Ecclesiastiques. Par M. Rozet. Paris, 1790.

dedicated, one to the Virgin, the other to the holy sacrament. At the upper or east end of the nave is the choir, which is somewhat raised above the surrounding area of the church, and entered by a flight of steps. It is usually separated from the nave by an ornamental balustrade; and its pavement is inlaid with marbles of various colours, and often very finely tessellated. The altar part is under the jurisdiction of the archbishop of the cathedral, and is appropriated to the higher order of the priests and deacons. The other part, from the high altar to the end of the choir, is occupied by the inferior clergy, and often by part of the instrumental band and singers who assist in the choral service. On each side are seats or stalls for the use of the priests and deacons, which are, throughout the Netherlands, constructed of oak, very finely carved into sculptural designs, often of figures as large as life, and very elaborate basso-relievos. In almost every choir is a reading-desk, called a *lecterne*, made of brass, in the shape of an eagle, with wings expanded to support the sacred volume. We have often wondered that the eagle should have been selected as a type for this purpose, and have been frequently told that it was adopted from the Romans; but we find from Ducange that the lecterne was made in this shape to designate St John the Evangelist, who is generally represented with an eagle behind him. The pulpit of the church, which is used only for the delivery of sermons, is also, throughout the Netherlands, constructed of oak, very frequently carved in a wonderful manner, so as to represent certain portions of holy writ; and it is so placed in the nave, that the congregation, listening to the preacher, shall look towards the east. The sacristy corresponds with the vestry of Protestant churches; and here the treasures of the church, the costly symbols and sacramental vessels, the rich vestments of the priests, and the relics of saints and martyrs, are preserved in safety. When, however, the church possesses the shrine of its patron saint—which may be described as an ark-shaped box or case, in which the remains of the saint are supposed to be deposited—so valuable a reliquary is kept immediately behind the high altar.

To return—for without some notion of the interior distribution of a Catholic church, the visitor on the continent will find himself continually at fault—the Antwerp cathedral, in its dimensions and proportions, is a magnificent edifice. The length of the nave, the height of the roof, the immense number of pillars which support the Gothic arcades of the aisles, produce an effect of extreme architectural solemnity; and when we remember that, in its ancient state, before the frenzied spirit of revolution had pillaged its treasures and dismantled its walls, the side chapels were adorned with altars of finely-sculptured marble, surmounted with most valuable paintings—that not only the high altar, but several other altars, were of solid silver, enriched with sacred emblems and sacramental vessels, including the costly ostensoir presented to the church by Francis I., and mounted with diamonds and precious stones, which were the gifts of other sovereigns, and of inestimable price; and when we furthermore picture to ourselves the immense dome, lighted up by lustres beaming from no less than one hundred chandeliers of massive silver, illuminating the pictured walls and monuments around, we can easily imagine that, when Philip II. here held a chapter of the Golden Fleece—which order was instituted by him at Bruges in honour of his marriage with Isabel of Portugal—so august a ceremonial, attended as it was by several sovereigns and princes, and an immense concourse of nobles richly attired, with their escutcheons waving upon silken banners over their heads, must have presented a most gorgeous spectacle. But it is to be remembered that these towns of the Netherlands were then the most influential cities in Europe; and as they now exist, we do not behold them in ruins, but have the more melancholy satisfaction of entering their churches, their town-halls, and palace-like houses as they then existed; so that the very streets still retain the architectural peculiarities and beauties of the middle ages. So great was the commercial intercourse between Antwerp and other parts of Europe, and its port was often so much crowded with vessels, that each successive fleet had to wait long in the Scheldt before it could obtain admission to discharge its cargoes. The opulence of this and other towns in Brabant and Flanders was such, that the rich burghers often outrivalled, in the ostentation of their wealth, the pageantry of sovereigns. The taste for prodigality and luxury extended through all classes of society, so that the good citizens in private lived in the most costly manner. They dressed themselves, men and women, in the most expensive fashion. Velvet and satin, silk and damask, were the ordinary material of their clothing; and gold, and silver, and precious stones, were such common articles of decoration, that we are informed that the harness even of their horses sparkled with brilliants that cost immense sums.* Among the ladies, this passion for display was carried to the highest extent. Hence, when the queen of Philip the Fair of France visited Bruges, astonished at the splendid display around her, she is said to have exclaimed with a feeling of wonder, not unmixed with a little womanly envy, 'I thought myself the only queen, but I see six hundred who appear more so than I.'

Upon leaving the cathedral, our attention was directed to a curious sort of iron canopy over a well, which was, we are informed, chiselled into this fantastic shape by Quentin Metsys, without the assistance of either a hammer or a file. To the history of this celebrated artist a romantic story is attached, which may give this iron monument of his skill an interest it would not otherwise possess, for it is by no means very ornamental. At an early age Quentin Metsys lost his father, and his mother being in very indigent circumstances, he supported her upon the wages of his hard-earned industry—for Quentin was a blacksmith, and toiled laboriously at his trade, in which he often displayed great ingenuity and taste, which are sufficiently evinced in the very elegant and elaborate balustrade of his workmanship that may be seen in the college of Louvain. That he was a dutiful and good son, is certain, for when—being of delicate health—sickness disabled him from working at the forge, he supported his mother by making those little metal images of saints which it was the custom, on the occasion of the procession of lepers, to distribute among the people. But nature had destined Quentin Metsys for a higher calling, which was curiously brought about by his being, while yet a youth, crossed in love. In the town of Antwerp lived an artist who had a very pretty daughter, of whom Quentin became so much enamoured, that he offered himself to her in marriage; and although she was nothing loath—for he had already won her consent—her father interposed his authority, refusing his child to be wedded to a worker in vile metals. Stung with disappointment, and determining to overcome an objection so humiliating, Quentin Metsys threw aside his hammer, forsook his anvil, and applied himself diligently to the study of the fine arts. And in this instance love's labour was not lost; for, cheered by the secret encouragement of his lady-love, he soon acquired such proficiency, that one day, upon entering the study of her father, who had just finished a picture of the fallen angels, which is still in the cathedral, he, unobserved by anybody, took up the brush and painted a bee on the thigh of the angel, which was so naturally and delicately sketched, that the proud old artist on his return started with astonishment. 'How came the little insect there?' forthwith he made inquiry; and discovered that the rejected blacksmith had renounced his early calling, and instead of being a son of Vulcan, was now transformed into a son of Apollo. He soon gave further evidence of his great abilities, and was rewarded by the hand of the

* Grattan's History of the Netherlands. London, 1830.

lady of his love. Thus did Quentin Metsys not only 'win his Genevieve, his bright and beauteous bride,' but became eventually one of the most distinguished artists in Flanders. But, after all, poor Quentin lived in stormy times; and upon his death, being considered an heretic, his remains were refused interment under the nave of the cathedral, and he was therefore buried without its precincts, immediately under the western portals of the church, upon the adjoining wall of which is a stone tablet inscribed to his memory; and by the side of his epitaph is the following Latin verse—'Connubialis Amor de Mulcibre fecit Apellem.'

We did not return to our hotel without pausing to admire the exterior architecture of the cathedral, which, on the side of the Place Verte, is blocked up by the immediate contiguity of a row of houses, so that the tower and spire are the principal objects of attraction. The open stone-work of the spire gives it a very light and elegant appearance; but it hardly deserves the encomium of Charles V., who observed that it should be kept under a glass-case; or the observation of Napoleon, that it has the appearance of being worked in Mechlin lace. Those who have seen the spire of the Strasburg cathedral—which, for lightness and elegance, and exquisitely minute workmanship, may be considered the marvel of architecture—will not hold it in such very high estimation. Still, it is a very beautiful object. Our guide, an intelligent lad, requested us to observe particularly its very great height, and also the newly-gilt weathercock upon its top, in which we saw nothing very remarkable, until we were informed that upon certain gala-days, as a sign of very great public rejoicing, some heroic aspirant to fame mounts to the top of the vane, and strides, saddle-fashion, across 'the bird of early dawn.' This wonderful feat, he added, was performed when her majesty Queen Victoria passed through Antwerp on the occasion of her late visit to the king of the Belgians; but we suspect that this was only a dwarfish miracle in comparison with that performed by a celebrated rope-dancer, who, when Isabel of Bavaria, on the occasion of her marriage, entered Paris, swung himself down from the tower of Notre-Dame to the bridge below—the Pont au Change—holding in one hand a lighted torch, as it was night, and in the other a wreath of flowers, which he planted so dexterously on the queen's head, and then so suddenly reascended to the tower, that neither her majesty nor any of the royal party perceived whence she had received the floral diadem.

OCCASIONAL NOTES.

WHITE AND BROWN BREAD.—UNFERMENTED BREAD.

Several years ago, we threw out the surmise that the separation of the white from the brown parts of wheat grain was likely to be baneful to health. We proceeded upon theoretical grounds, believing that Providence must have contemplated our using the entire grain, and not a portion only, selected by means of a nicely-arranged machinery. It struck us forcibly, that to go on, for a long course of years, thus using a kind of food different from what nature designed, could not fail to be attended with bad consequences. We have since learned that our views have some recognised support in science. The following paragraph from a recent pamphlet* will at once serve to keep the subject alive in the minds of our readers, and explain the actual grounds on which the separation of flour is detrimental:—'The general belief,' says the writer, 'is, that bread made with the finest flour is the best, and that whiteness is the proof of its quality; but both these opinions are popular errors. The whiteness may be, and generally is, communicated by alum, to the injury of the consumer; and it is known by men of science that the bread of unrefined flour will sustain life, while that made with the refined will not. Keep a man on brown bread and water, and he will live and enjoy good health; give him white bread and water only, and he will gradually sicken and die. The meal of which the first is made contains all the ingredients necessary to the composition of nourishment of the various structure composing our bodies. Some of these ingredients are removed by the miller in his efforts to please the public; so that fine flour, instead of being better than the meal, is the least nourishing; and, to make the case worse, it is also the most difficult of digestion. The loss is, therefore, in all respects a waste; and it seems desirable that the admirers of white bread (but especially the poor) should be made acquainted with these truths, and brought to inquire whether they do not purchase at too dear a rate the privilege of indulging in the use of it. The unwise preference given so universally to white bread, led to the pernicious practice of mixing alum with the flour, and this again to all sorts of adulterations and impositions; for it enabled bakers, who were so disposed, by adding more and more alum, to make bread made from the flour of an inferior grain look like the best or most costly, or to dispose of it accordingly; at once defrauding the purchaser, and tampering with his health. Among the matters removed by the miller are the larger saline substances, which are indispensable to the growth of the bones and teeth, and are required, although in a less degree, for daily repair. Brown bread should, therefore, be given to nurses, and to the young or the growing, and should be preferred by all, of whatever age, whose bones show a tendency to bend, or who have weak teeth. It is believed that brown bread will generally be found the best by all persons having sluggish bowels, and stomachs equal to the digestion of the bran. But with some it will disagree; for it is too exciting to irritable bowels, and is dissolved with difficulty in some stomachs. When this happens, the bran should be removed, either wholly or in part; and by such means the bread may be adapted, with the greatest ease, to all habits and all constitutions.'

Mr Smith, in his late remarkable work on Fruits and Farinacea as the food of man, gives some illustrations of this doctrine. 'Bulk,' he says, 'is nearly as necessary to the articles of diet as the nutrient principle. They should be so managed that one will be in proportion to the other. Too highly nutritive diet is probably as fatal to the prolongation of life and health, as that which contains an insufficient quantity of nourishment. It is a matter of common remark among old whalemen, that, during their long voyages, the coarser their bread, the better their health. "I have followed the seas for thirty-five years," said an intelligent sea captain to Mr Graham, "and have been in almost every part of the globe; and have always found that the coarsest pilot-bread, which contained a considerable portion of bran, is decidedly the healthiest for my men." "I am convinced, from my own experience," says another captain, "that bread made of the unbolted wheat meal is far more wholesome than that made from the best superfine flour—the latter always tending to produce constipation." Captain Dexter of the ship Isis, belonging to Providence, arrived from China in December 1804. He had been about 190 days on the passage. The sea-bread, which constituted the principal article of food for his men, was made of the best superfine flour. He had not been long at sea before his men began to complain of languor, loss of appetite, and debility. These difficulties continued to increase during the whole voyage; and several of the hands died on the passage of debility and inanition. The ship was obliged to come to an anchor about thirty miles below Providence; and such was the debility of the men on board, that they were not able to get the ship under weigh again, and the owners were under the necessity of sending men down from Providence to work her up. When she arrived, the owners asked Captain Dexter what was the cause of the sickness of his men. He replied, "The bread was too good."'

* Instructions for Making Unfermented Bread, by a Physician. London: Taylor and Walton. 1846.

The primary object of the pamphlet already quoted, is to explain a mode of making bread without the use of yeast, the *raising* process being accomplished by carbonate of soda and muriatic acid. The formula recommended for bread made of *wheat meal* (that is, the flour of entire grain) is—wheat meal 3 pounds avoirdupois, bicarbonate of soda, in powder, 4½ drachms troy, hydrochloric acid 5 fluid drachms and 25 minims or drops, water 30 fluid ounces, and salt ⅔ of an ounce troy. 'Bread made in this manner,' says the writer, 'contains nothing but flour, common salt, and water. It has an agreeable natural taste, keeps much longer than common bread, is more digestible, and much less disposed to turn acid. Common bread, like everything that has been fermented, ferments easily again, to the great discomfort of many stomachs; and not only so, but as "a little leaven leavens the whole lump," it communicates a similar action to all the food in contact with it. Unfermented bread being free from this defect, is beneficial to those who suffer from headache, acidity, flatulence, eructations, a sense of sinking at the pit of the stomach, or pain after meals, and to all who are subject to gout or gravel. It is also useful in many affections of the skin. These remarks apply to both varieties of the bread, but especially to the brown, which is further invaluable to all who are liable to constipation from torpidity of the colon, or large intestines —the common infirmity of the sedentary, and of those who have been accustomed to oatmeal diet in their youth.'

Of unfermented bread we know nothing besides what is stated in its favour in this pamphlet, excepting that an intelligent friend assures us of his having experienced much benefit to his health from the use of it during the last twelvemonth. It is certainly, however, very desirable, for another reason, that unfermented should be, as far as possible, substituted for fermented bread. At present, owing to the process of fermenting this aliment, the life of the operative baker is one of the most slavish known in our country. It is distressing to think of the misery and hardship incurred by a portion of our fellow-creatures in producing the bread laid on our tables every day. We used to associate sugar with the blood and tears of the negroes: we might, with equal justice, connect hot rolls and snowy loaves with the sleepless, harassed lives of a portion of our own population. Could we agree to use unfermented bread, the slavish life of the baker would be at an end, for bread could then be made in two hours, where eight are now necessary.

It is hardly necessary to point out that unfermented bread, being produced at less expense of labour, would in that measure be cheaper to the public. A reduction of price would arise from another cause. By the use of the chemicals, there would be a saving of ten per cent. in the flour. 'In the common process,' says the pamphlet, 'much of the saccharine part of the flour is lost by being converted into carbonic acid and spirit; and this waste is incurred solely for the purpose of getting carbonic acid to raise the dough. By the new method, the waste is avoided, and the gas obtained in a manner equally beautiful and efficacious—another striking instance of the successful application of chemical philosophy to the arts of life.

SPECTRE WITNESSES.

Much as the disembodied spirits of the dead have associated themselves with men's actions, it is a rarity to find the intercourse between the world of life and that of spirits forming an item in official and practical business, and holding a place in the record of its transactions. The conflict of intellects in the practical business of life is a great exorciser of evil spirits; and while the strong-minded, the educated, and the learned, in the solitude of cloisters, in old graveyards, in caverns, or on 'blasted heaths,' have every now and then professed to be visited by apparitions, twelve of the most superstitious men in the world, empannelled as a jury, would hardly be found to attest a ghost story by a verdict returned in open court. Defoe, it is true, presents to us the history of a murderer who, in giving false evidence against an innocent man, is confronted by the ghost of the victim, with which he carries on a dialogue in open court, ultimately fatal to his conspiracy. But the ingenious writer leaves it undetermined whether the spectre was supposed to be present, or the diseased imagination of the perjured murderer, working upon his organs of sight, had called up the impression, and made the suggestions of his evil conscience, like those of Macbeth, appear to be embodied before his eyes. And here, by the way, let us just note how preposterously the stage, in representing this awful instance of the force of conscience, outwits itself in the belief that it is gratifying the taste of the multitude. The true impressiveness of the guilty man's terror consists in his seeing what the onlookers see not. 'The table is full,' but to him only—not to the wondering guests, or to his own iron-nerved wife. Yet at this moment, in the usual performance of the piece, some big stout man, dressed in tartans, with his throat painted to represent its being cut, stalks in and seats himself right in front of the audience, who should see the ghost of Banquo only reflected in the horror that distorts the countenance of Macbeth.

To return to our immediate subject. Sir Walter Scott having discovered, in the criminal records of Scotland, a trial for murder, in which some information received from the ghost of the murdered man was a part of the evidence, thought the record of sufficient interest to be printed for the Bannatyne Club, with the title, 'Trial of Duncan Terig *alias* Clerk, and Alexander Bayne Macdonald, for the Murder of Arthur Davies, Sergeant in General Guise's regiment of foot, June 1754.' The sergeant was commander of a small party, employed in the obnoxious duty of enforcing the act against the Highlanders carrying arms and wearing their native costume. He was stationed at Braemar, where the quantity of game on the surrounding hills tempted him to make solitary sporting excursions. The spot where he met his death was on the hill of Christie, one of the range of mountains which extends from the Dee in Aberdeenshire towards the Spital of Glenshee, in the Braes of Angus. It is at this day a savage and solitary district, where human habitations or cultivated lands are hardly to be met with, and a body might lie in the deep heather till the flesh fell from the bones ere the usual course of chance might bring a visitor to the spot. We may have some idea of the sergeant's character from the testimony of his widow. He seems to have been a fearless, frank, good-natured man, fond of field-sports, and well to do in the world. The wealth he carried about his person would not now be often found with one of his standing; but from Fielding's novels, and other sources, it is pretty clear that a sergeant in the army occupied a much higher social position in that age than in the present.

The most important portion of the widow's testimony was thus given:—'Her husband was a keen sportsman, and used to go out a-shooting or fishing generally every day. When he went along with the party on patrol, he sent the men home, and followed his sport. On other occasions, he went out a-shooting by himself alone. He was a sober man, a good manager, and had saved money to the value of about fifteen guineas and a-half, which he had in gold, and kept in a green silk purse, which he enclosed within a leathern purse, along with any silver he had. Besides this gold, he generally wore a silver watch in his pocket, and two gold rings upon one of his fingers, one of which was of pale yellow gold, and had a little lump of gold raised upon it, in the form of a seal. The other was a plain gold ring, which the deponent had got from David Holland, her first husband, with the letters D. H. on the inside, and had this posy on it—"When this you see, remember me." Sergeant Davies commonly wore a pair of large silver buckles in his shoes, marked also with the letters D. H. in the inside,

which likewise had belonged to her said former husband; as also he wore silver knee-buckles, and had two dozen silver buttons upon a double-breasted vest, made of striped lutestring. He frequently had about him a folding penknife, that had a brown tortoiseshell handle, and a plate upon the end of it, on which was cut a naked boy, or some such device, with which he often sealed his letters. One day, when he was dressing some hooks, while the deponent was by, she observed he was cutting his hat with his penknife, and she went towards him and asked what he meant by cutting his hat? To which he answered that he was cutting his name upon it. To which the deponent replied, she could not see what he could mean by putting his name upon a thing of no value, and pulled it out of his hand in a jocular way; but he followed her, and took the hat from her, and she observed that the A. was then cut out in the hat; and after he got it, she saw him cut out the letter D., which he did in a hurry, and which the deponent believed was occasioned by the toying that was between them concerning this matter; for when she observed it, she said to him, you have made a pretty sort of work of it by having misplaced the letters. To which he answered that it was her fault, having caused him to do it in a hurry. The hat now upon the table, and which is lying in the clerk's hands, and referred to in the indictment, to the best of her judgment and belief is the hat above-mentioned. She never has seen neither the said sergeant, the green silk purse or leathern purse before-mentioned, nor the buckles for his shoes or knees, watch, or penknife, since he marched from his quarters with the party at the time at which he is supposed to have been murdered. On Tuesday, being the day immediately preceding Michaelmas, being the 28th of September 1749, her husband went out very early in the morning from Dubrach, and four men of the party under his command soon after followed him, in order to meet the patrol from Glenshee; and in the afternoon, before four o'clock, the four men returned to Dubrach, and acquainted the deponent that they had seen and heard him fire a shot, as they believed, at Tarmatans, but that he did not join company with them. At the place appointed they met with a corporal and a party from Glenshee, and then retired home. Her husband never returned. She has never met with anybody who saw him after the party returned from the foresaid place, excepting the corporal who that day commanded the party from Glenshee, who told her that, after the forementioned party from Dubrach had gone away from the foresaid appointed place, Sergeant Davies came up to him all alone, upon which the corporal told him he thought it was very unreasonable in him to venture upon the hill by himself, as for his part he was not without fear, even when he had his party of four men along with him; to which Sergeant Davies answered, that when he had his arms and ammunition about him, he did not fear anybody he could meet. Her husband made no secret of his having the gold before-mentioned; and upon the many different occasions he had to pay and receive money, he used to take out his purse and show the gold; and even when he was playing with children, he would frequently take out his purse and rattle it for their diversion, from which it was generally known in the neighbourhood that the sergeant was worth money, and carried it about him. From the second day after the sergeant and party went from Dubrach as aforesaid, when the deponent found he did not return, she did believe, and does believe at this day, that he was murdered; for that he and she had lived together in as great amity and love as any couple could do that ever were married, and he never was in use to stay away a night from her; and it was not possible he could be under any temptation to desert, as he was much esteemed and beloved by all his officers, and had good reason to believe he would have been promoted to the rank of sergeant-major upon the first vacancy.' The body had lain for nearly a year before it was discovered. Of the state in which it was found, and the alleged appearance of the sergeant's ghost to the witness, Alexander Macpherson *alias* Macgillas, the following is an account in that person's own words, as his evidence was taken down in court:—

'In the summer of 1750, he found, lying in a moss-bank in the hill of Christie, a human body; at least the bones of a human body, of which the flesh was mostly consumed, and he believed it to be the body of Sergeant Davies, because it was reported in the country that he had been murdered in that hill the year before. When he first found this body there was a bit of blue cloth upon it, pretty entire, which he took to be what is called English cloth; he also found the hair of the deceased, which was of a dark mouse colour, and tied about with a black ribbon; he also observed some pieces of a striped stuff; and found also lying there a pair of brogues, which had been made with latches for buckles, which had been cut away by a knife. By the help of his staff, he brought out the body, and laid it upon plain ground; in doing whereof, some of the bones were separated one from another. For some days he was in a doubt what to do; but meeting with John Growar in the moss, he told John what he had found, and John bade him tell nothing of it, otherwise he would complain of the deponent to John Shaw of Daldownie; upon which the deponent resolved to prevent Growar's complaint, and go and tell Daldownie of it himself; and which having accordingly done, Daldownie desired him to conceal the matter, and go and bury the body privately, as it would not be carried to a kirk unkent, and that the same might hurt the country, being under suspicion of being a rebel country. Some few days thereafter he acquainted Donald Farquharson of his having seen the body of a dead man in the hill, which he took to be the body of Sergeant Davies. Farquharson at first doubted the truth of his information, till the deponent told him that, a few nights before, when he was in bed, a vision appeared to him as of a man clad in blue, who told the deponent, "I am Sergeant Davies;" but before he told him so, the deponent had taken the said vision, at first appearance, to be a real living man, a brother of Donald Farquharson's. The deponent rose from his bed, and followed him to the door, and then it was, as has been told, that he said he was Sergeant Davies, who had been murdered in the hill of Christie near a year before, and desired the deponent to go to the place he had pointed at, where he would find his bones, and that he might go to Donald Farquharson and take his assistance to the burying of him. Upon giving Donald Farquharson this information, Donald went along with him, and found the bones as he had informed Donald, and then buried them with the help of a spade, which he (the deponent) had alongst with him: and for putting what is above deponed on out of doubt, depones that the above vision was the occasion of his going by himself to see the dead body, and which he did before he either spoke to John Growar, Daldownie, or any other body. While he was in bed another night, after he had first seen the body by himself, but had not buried it, the vision again appeared, naked, and minded him to bury the body; and after that he spoke to the other folks above-mentioned, and at last complied, and buried the bones above-mentioned. Upon the vision's first appearance to the deponent in his bed, and after going out of the door, and being told by it he was Sergeant Davies, the deponent asked him who it was that had murdered him, to which it made this answer, that if the deponent had not asked, he might have told him, but as he had asked him, he said he either could not, or would not; but which of the two expressions the deponent cannot say. But at the second time the vision made its appearance to him, the deponent renewed the same question; and then the vision answered that it was the two men now in the panel [at the bar] that had murdered him. And being further interrogated in what manner the vision disappeared from him first and last, depones that, after the short interviews above-mentioned, the vision at

both times disappeared and vanished out of his sight in the twinkling of an eye; and that, in describing the panels by the vision before-mentioned as his murderers, his words were, "Duncan Clerk and Alexander Macdonald:" depones that the conversation betwixt the deponent and the vision *was in the Irish language.*'

The idea of an English sergeant, even in the exalted form of a spirit, being able to speak Gaelic, startled the judge and jury, although, as Sir Walter Scott remarks, there is no greater stretch of imagination in supposing a ghost to speak a language which the living person did not understand, than in supposing it to speak at all. The other evidence against the prisoners was very strong; but this consideration as to Macpherson's deposition seems to have thrown a discredit over the whole case, and a verdict of acquittal was the consequence. A German would now suggest that phenomena of this kind are not wholly objective or external to the beholder, but partly subjective, and taking a character from himself, so that the English sergeant might really appear to the seer to speak 'as good Gaelic as ever was heard in Lochaber.' But such considerations were not likely to occur to a Scotch criminal court in the middle of the eighteenth century.

A book, privately printed under the title of 'Notices relative to the Bannatyne Club,' as appropriate to Sir Walter Scott's volume, gives an account of a case in Queen Anne's county, Maryland, where the appearance of a spectre was attested in an action as to a will.

'William Briggs said that Thomas Harris died in September 1790. In the March following he was riding near the place where Thomas Harris was buried, on a horse formerly belonging to Thomas Harris. After crossing a small brook, his horse began to walk on very fast; it was between the hours of eight and nine o'clock in the morning; he was alone; it was a clear day; he entered a lane adjoining to the field where Thomas Harris was buried; his horse suddenly wheeled in a panel of the fence, looked over the fence into the field where Thomas Harris was buried, towards the graveyard, and neighed very loud. Witness then saw Thomas Harris coming towards him in the same apparel as he had last seen him in his lifetime; he had on a sky-blue coat. Just before he came to the fence, he varied to the right, and vanished. His horse took the road.'

We give some other instances of delusions or impostures having some resemblance to our Highland ghost story, in Sir Walter Scott's words:—

'In the French *Causes Celebres et Interresantes*, is one in which a countryman prosecutes a tradesman, named Anguier, for about twenty thousand francs, said to have been lent to the tradesman. It was pretended that the loan was to account of the proceeds of a treasure which Mirabel the peasant had discovered by means of a ghost or spirit, and had transferred to the said Anguier, that he might convert it into cash for him. The defendant urged the impossibility of the original discovery of the treasure by the spirit to the prosecutor; but the defence was repelled by the influence of the principal judge; and on a charge so ridiculous, Anguier narrowly escaped the torture. At length, though with hesitation, the prosecutor was nonsuited, upon the ground that if his own story was true, the treasure, by the ancient laws of France, belonged to the crown. So that the ghost-seer, though he had nearly occasioned the defendant to be put to the torture, profited in the end nothing by his motion.

'This is something like a decision of the great Frederick of Prussia. One of his soldiers, a Catholic, pretended peculiar sanctity, and an especial devotion to a particular image of the Virgin Mary, which, richly decorated with ornaments by the zeal of her worshippers, was placed in a chapel in one of the churches of the city where her votary was quartered. The soldier acquired such familiarity with the object of his devotion, and was so much confided in by the priests, that he watched for, and found, an opportunity of possessing himself of a valuable diamond necklace belonging to the Madona. Although the defendant was taken in the manner, he had the impudence, knowing the case was to be heard by the king, to say that the Madona herself had voluntarily presented him with her necklace, observing that, as her good and faithful votary, he had better apply it to his necessities than that it should remain useless in her custody.

'The king, happy of the opportunity of tormenting the priests, demanded of them whether there was a possibility that the soldier's defence might be true. Their faith obliged them to grant that the story was possible, while they exhausted themselves on the improbabilities that attended it. "Nevertheless," said the king, "since it is possible, we must, in absence of proof, receive it as true in the first instance. All I can do to check an imprudent generosity of the saints in future, is to publish an edict, or public order, that all soldiers in my service who shall accept any gift from the Virgin, or any saint whatever, shall, *eo ipso*, incur the penalty of death."'

JOTTINGS ON TEA.

A CORRESPONDENT of the Medical Times translates the following observations by Dr Bleischt in *Oesterr Tahrbuchern* 'On the Chemical and Dietetic Relations of Tea:'—Two Arabs, who travelled in Eastern Asia in the ninth century, even thus early spoke of tea: in Europe it did not become known before the seventeenth century. Dutch travellers brought it from China in the year 1600. In 1666 Lord Arlington took the first pound of tea into England, having bought it in Holland for L.3. In 1763 Linnæus obtained, after seventeen unsuccessful attempts, a living tea-plant from China, which blossomed at Upsala in the year 1765. The tea-shrub is very closely related to the camellia. Left to itself, it attains a height of ten or twelve feet; in a cultivated state it is kept as low as five or six feet, in order to facilitate the growth of the branches and the tea-gathering. Linnæus distinguished two species: the green tea (thea viridis), which is stronger and higher, grows in China as far as the 40° to 45° north latitude; and bohea tea (thea bohea), which is smaller, and only cultivated as far as the 27° to 28° north latitude. In China, the tea prospers best at the south side of hills near small rivers; in Japan, it is cultivated on the borders of fields. The tea is sown; the shrub furnishes three good annual harvests for a term of three to seven years. The first, gathered in February or March, only yields fine shoots, which are little developed: this is the best sort, and is called imperial tea. The leaves and shoots collected in April are less esteemed. In the third harvest, in May or June, the coarsest leaves are cut off and sorted: after this the leaves are left on the shrub. For the purpose of drying, the leaves are laid on iron pans, and exposed to a moderate heat in little stoves: they discharge a caustic yellowish green juice. When dried, they are rolled with the hands; sometimes they are laid on a fine sieve, and exposed to hot watery vapours till they are moistened, and then they are dried as before. This tea, obtained by the dry method, is said to be the black tea; that obtained by the moist method, the green tea. Others maintain the reverse of this to be the case. It is also asserted by some that both sorts are dried in the sun, only that the green is exposed for a shorter time than the black. Many teas are made odoriferous by the admixture of different species of camellias. In England, the Chinese tea is adulterated with ash, hawthorn, and other leaves.

The chemical constituents of tea are—volatile oil, tannic acid, and theine; the other constituents are those commonly found in the leaves of vegetables. The tea owes its smell, and part of its effects, to its volative oil. The tannic acid blackens the salts of iron, as the tannic acid of oak. The theine is the most remarkable constituent. Peligot has lately discovered in tea a larger quantity of theine, besides some caseine, both of which are azotised substances. The use of carbonate of soda is advantageous in the preparation of tea, as it is in that of coffee; it increases the power of drawing the extract out of the leaves, makes the infusion stronger, and gives it a better taste. In the ashes of tea the author found oxide of iron and argilla, and draws from this circumstance the conclusion, that the shrub grows and thrives on ferruginous and argillaceous soils, which are also in other respects favourable to the formation of ammonia, and of the azotised caseine and theine.

In using tea, most persons only consume those parts which are to be extracted by water, particularly the ethereal oil, the tannate of theine, gum, and most of the soluble salts. But the tea is not exhausted by a single infusion in boiling water; at least one-third of the soluble constituents remain in the leaves, with the greatest part of the caseine. Carbonate of soda dissolves the caseine, and therefore materially increases the strength of the beverage. The theine is composed of eight atoms of carbon, four atoms of nitrogen, ten atoms of hydrogen, and two atoms of oxygen. In those countries where tea is very generally taken (as England and Holland), diseases of relaxation and emollition prevail, particularly among the female sex. Tea considerably increases the sensibility of the whole nervous system, and relaxes the digestive canal; but it certainly possesses some nutritive power, in consequence of containing two azotised substances—theine and caseine. The increased secretion of urea and bile, subsequent to its use, shows its medicinal effect. The Chinese use the tea-Buu-leaves as an emetic. Fresh tea acts, according to Percival, like opium and henbane on the nerves, and like foxglove on the function of the heart and arteries. Those men who are engaged in unpacking tea are very liable to become paralytic: the exhalations of tea produce headache, giddiness, &c. Vessels of porcelain are the best for extracting the constituents of tea; and tin boxes should always be used for preserving it.

THE IMPORTANCE OF RESOLUTION.

'Resolution,' says a writer, 'is omnipotent.' And if we will but solemnly determine to make the most and the best of all our powers and capacities; and if to this end, with Wilberforce, we will but 'seize and improve even the shortest intervals of possible action and effort,' we shall find that there is no limit to our advancement. Without this resolute and earnest purpose, the best aids and means are of little worth; but with it, even the weakest are mighty. Without it, we shall accomplish nothing; with it, everything. A man who is deeply in earnest, acts upon the motto of the pickaxe on the old seal: 'Either I will find a way, or I will make one.' He has somewhat the spirit of Bonaparte, who, when told on the eve of battle that circumstances were against him, replied, 'Circumstances! I make or control circumstances, not bow to them.' In self-cultivation, as in everything else, to think we are able, is almost to be so; to resolve to attain, is often attainment. Everywhere are the means of progress, if we have but the spirit, the fixed purpose to use them. And if, like the old philosopher, we will but take as our motto: 'Higher—for ever higher!' we may rise by them all. He that resolves upon any great end, by that very resolution has scaled the chief barrier to it; and so he who seizes the grand idea of self-cultivation, and solemnly resolves upon it, will find that idea, that resolution, burning like living fire within him, and ever putting him upon his own improvement. He will find it removing difficulties, searching out or making means, giving courage for despondency, and strength for weakness; and, like the star in the east to the wise men of old, guiding him nearer and still nearer to the sum of all perfection. If we are but fixed and resolute—bent on self-improvement, we shall find means enough to it on every side, and at every moment; and even obstacles and opposition will but make us like the fabled 'spectre-ships, which sail the fastest in the very teeth of the wind.'—*'Self-Culture,' by Rev. Tryon Edwards.*

VEGETABLE DIET.

It has been established by nature, on the best grounds, that our nourishment should be used in form rather coarse—securing full mastication and insalivation, and a longer retention in the stomach. Plain simple food only promotes moderation and longevity, while compounded and luxurious food shortens life. The most extraordinary instances of longevity are to be found among those classes of mankind who, amidst bodily labour and the open air, lead a simple life according to nature—such as farmers, gardeners, hunters, &c. The more man follows nature, and is obedient to her laws, the longer will he live: the further he deviates from these, the shorter will be his existence. Rich and nourishing food, and an immoderate use of flesh, do not prolong life. Instances of the greatest longevity are to be found among men who, from their youth, lived principally on vegetables, and who perhaps never tasted flesh.—*Hufeland.*

POETS.

'Poeta nascitur, non fit'—
A hackneyed adage, ancient writ,
Which, though to question liable,
Has met with men most pliable,
Who, having faith, would seem to scorn
A poet made as well as born;
Nevertheless, be it our aim
To show that poets worth the name—
Poets in very deed and truth,
Undoubtedly have need of both.

The man must first be born a bard,
And then be made, or can't be heard:
Like as the seed of any plant
Is first complete, without a want;
The root is there, and the stem too,
The leaf and flower, in embryo;
And yet, who in the seed can see
Ought but the capability?
'Twould surely prove of nothing worth
Wanting fit soil to bring it forth.
Just so the poet. Reader, this
Is not our own hypothesis;
Or, if our own original,
The notion others have as well
(But in their contemplations,
Not these associations),
For Gray speaks of a Milton mute,
Inglorious, who, beyond dispute,
According to the poet's view,
Was born, but wanted making too.
If this be right, here we shall see
Most palpable deficiency,
And find him of his glory shorn—
No poet, though a poet born.
The point of error seems to be,
In weighing things abstractedly.

Considered thus, we must demur
To say, 'Poeta nascitur;'
We cannot say, 'Poeta fit,'
For that is quite as far from right;
But, as it is remarked above,
Poets must both together prove;
Therefore be thus the proverb writ,
'Poeta nascitur et fit.'

W. B. S.

CRUELTY TO ANIMALS—SONNET.

Alas! that man, to whom God's grace hath given
To rule o'er all created things below,
Which walk the earth or with the waters flow,
Should so abuse the gift of bounteous Heaven,
As to behave more like the beasts, which, driven
By passions wild, no ruth or pity know,
Than one in whom the plants ethereal grow
Of reason and of conscience; which, like leaven,
Should permeate the mass of human deeds,
And give man's life and character a mark
Of gentleness; which, when some sufferer bleeds,
Would stay, and to its sad, dumb moanings hark,
Rather than cause or see whate'er exceeds
Of needful suffering the infliction dark.

C. F.

PHYSICAL FACTS.

As an instance of the adaptation between the force of gravity and forces which exist in the vegetable world, we may take the positions of flowers. Some flowers grow with the hollow of their cups upwards; others 'hang the pensive head,' and turn the opening downwards. The positions in these cases depend upon the length and flexibility of the stalk which support the flower, or, in the case of the *euphorbia*, the germen. It is clear that a very slight alteration in the force of gravity, or in the stiffness of the stalk, would entirely alter the position of the flower-cups, and thus make the continuation of the species impossible. We have, therefore, here a little mechanical contrivance, which would have been frustrated if the proper intensity of gravity had not been assumed in the reckoning. An earth, greater or smaller, denser or rarer, than the one on which we live, would require a change in the structure and strength of the footstalks of all the little flowers that hang their heads under our hedges. There is something curious in thus considering the whole mass of the earth, from pole to pole, and from circumference to centre, as employed in keeping a snowdrop in the position most suited to the promotion of its vegetable health.—*Whewell.*

No. 133. New Series. SATURDAY, JULY 18, 1846. Price 1½d.

A DAY AT DE LA RUE'S.

'Where to, sir?' said the cabman, touching his hat, and leaning from the box. 'Bunhill Row.' In a moment I was off, and very speedily found myself hurrying through Clerkenwell, towards that curious and classic labyrinth of streets composing the north-east division of the metropolis. The difficulties of Chiswell Street and Barbican were passed, and I was set down at a port-cocher, the limit of my excursion, as the good early hour of eleven sounded from St Paul's.

It was a visit of curiosity. I wished to see one of the most remarkable establishments in London—an establishment which could only flourish in the midst of a great and wealthy people—De la Rue and Company's manufactory of fancy stationery. The art of writing letters is pretty nearly as old as the hills; but, till within the last twenty years, there was no such thing as a tastefully-got-up epistle. There was a deficiency in the *mécanique* of letter-writing. In Norway, at the present day, when a person wishes to write a note, he cuts a piece from a large sheet of paper; and something of this sort was prevalent in England forty or fifty years ago. It was considered a great advance in taste when a paper-maker at Bath got up what he called his 'Bath post'—a smooth yellow paper, quarto size, with a small stamp in the corner of the sheet. Matters remained at this point till a comparatively recent period, when the whole business of the stationer underwent a rapid and most extraordinary change—the establishment of the penny post alone causing the introduction of many new auxiliaries to epistolary correspondence. It cannot but be interesting to know who has led this great movement—who has filled the ladies' writing-cases with finely-tinted note papers—who has given to the world the envelope, the enamelled calling-card, and the numerous other elegancies which now fill the shop-window of the stationer. Different active spirits have contributed their respective inventions in this useful department of art, but the master-mind has been that of Thomas De la Rue. Mr De la Rue is a native of Guernsey, and was bred to the business of a printer. He afterwards abandoned this profession, and was engaged for a number of years in London as a manufacturer of straw-hats. In consequence of the successive changes in fashion, which ended in the general disuse of straw for bonnets, this ingenious person was several times ruined; but, possessing a boundless buoyancy of temperament, and with inexhaustible inventive faculties, he always alighted on some fresh novelty, and recovered his former position. Finally, driven from straw, he fell upon the idea of making bonnets of embossed paper. This was a great hit; but ladies soon discarded paper hats, and Mr De la Rue, for ever abandoning bonnets, took up the card and paper trade. He had now a wide field before him, and, in the preparation of various little articles, excited and cultivated the public taste. At the end of twenty years, we find him the elder member of a company, with which are associated two of his sons. What was once a small and obscure concern, is now the largest of the kind in the world.

Entering by the large gateway of this interesting establishment, I was, by the kindness of one of the partners, conducted over the several departments of the works—the whole nestling in a cluster of old edifices, and forming an amusing hive of industry; steam-engines, machinery, and animated beings, commingling in restless and varied movement. The purpose of nearly all that strikes the eye, is to cause paper to assume new forms and appearances. Of this article, forty-five thousand reams, valued at L.30,000, are consumed annually—a quantity so great, that it would require three mills for its production. Of the other articles used, such as colours, oils, varnishes, leather, and gold and silver leaf, the value may be set down at from L.10,000 to L.12,000. I hope it is not trespassing on confidence likewise to mention that even the money paid for gas amounts to L.400, and for coal L.600 per annum. The coal is employed principally in furnaces for the steam-engines, of which there are two, one of eight, and the other of fifteen horse-power. With steam-pipes from the furnaces, the whole establishment is safely and economically heated. It will perhaps afford still more impressive considerations of the completeness of the arrangements, when I observe that the first place into which I was conducted was a large apartment devoted exclusively to the making and mending of machines. Here, at massive iron planing tables, and turning apparatus, I found five or six engineers busy at work, preparing lately-invented machines of different kinds. Mr Warren De la Rue, by whom some of the most ingenious machines have been constructed, superintends this and other mechanical departments. This young gentleman mentioned to me that they could not possibly conduct their business with satisfaction and profit, unless they had always ready at hand the means of repairing and making machinery; the time lost and trouble expended in getting this species of work done out of the house would be tormenting and ruinous.

Adjoining this department is a mill-like apparatus for grinding colours, and materials for enamelling; and further on, in two upper apartments, is a laboratory, with retorts, mixtures, and a store of bottles sufficient to set up a chemist's shop: here is also a chemical library of French and English books, which are in constant requisition. It is deemed somewhat of a favour to be admitted to this department; for many projects for executing new and peculiar tints and surfaces, likewise processes for electrotyping, not generally known, are here daily in operation. The electrotyping, which is

carried on by means of large troughs full of the appropriate liquids, is employed to multiply casts of any engraved or otherwise figured surface. Mr De la Rue has carried his ingenuity so far in this branch of art as to produce an electrotype plate, in copper, from the finest lace, and has hence been able to impart the effect of lace to printing in colours. How curious that a piece of delicate tissue, taken from a lady's cap, can, by means of troughs, acids, and other materials, along with electric action, be made to produce a solid plate of copper from which the pattern of the original can with facility be printed! Instead of using wax for taking moulds, *gutta percha*, a newly-discovered substance from Borneo, has here lately been introduced. It partakes principally of the nature of caoutchouc; but with this is combined a certain farinaceous quality, and it therefore retains impressions better than preparations of India-rubber.

By the electrotyping process, a very small piece of engraving can be multiplied to any extent; and therefore, supposing we wish the surface of a sheet of paper to be printed all over with a continually-repeated pattern—for example, the patterns on the backs of playing-cards—we need only engrave a single square inch: having got the electrotype repetitions of the original, they are all soldered together, and the sheet of printing surface is formed. Of what immense value to the arts is this discovery, any one can form an opinion. Mr De la Rue, however, is prouder of his wire-cloth inventions than of any improvements he may have introduced into the process of electrotyping. In order to produce printing in colours, like the checks of tartan, or any other diversity of lines, he has succeeded in forming, by means of the Jacquard loom, a cloth of brass wires, each wire being a type, so to speak; and the cloth being fixed on a block, it gives an impression of great clearness and beauty. The cross-lined coloured papers which one sometimes sees in the fly-leaves of books, and on the backs of cards, are effected by this ingenious application.

So far I have spoken only of things of a preparatory nature, and yet the list is not half exhausted. Above the electrotyping room is one occupied with die-sinkers and engravers—men busy with hammers, punches, and chisels, executing objects to be employed in some of the more elegant kinds of printing. Besides these artists, many individuals, I was told, were employed out of doors in designing patterns. On this branch, indeed, some of the best artists in London are occasionally engaged. Novelty and taste are never for a moment neglected. Mr De la Rue mentioned to me that he sometimes gives as much as L.20 or L.30 for the drawing of a design not larger than your hand. The best classic models of antiquity are sought out, and so likewise have there been procured some of the most tasteful designs after Saracenic originals. Perfect novelty, however, is a governing principle. The object of the concern is to maintain a high character for originality—to copy from no one, English or continental. Formerly, in England, few or no manufacturers thought of going to the expense of employing designers, and consequently designers did not exist amongst us. In the chief manufacturing towns there might have been here and there a dissipated man of genius, who, when he could be laid hold of quite sober, would, for a guinea or so, furnish a design, such as it was; but there was no principle in the thing, and almost every manufacturer copied from French originals; the more enterprising among them bribing French workmen to send early copies of what they had begun to execute. The necessity for competing with continental manufacturers in the home market, consequent on the late free-trade measures, has, among respectable men, put an end to this meagre and shabby state of affairs. Every respectable tradesman, who desires to avoid following among the mere herd of imitators, not only employs skilled designers, but is constantly racking his brains how he is to maintain his place in the market. It sounded new to me, in general principles of trade, to be told that no man can now expect great success in any fancy manufacture *unless he competes with himself*. Competition with others wont do any longer. The true art consists in not waiting to be stimulated by rivalry, but in bringing out fresh novelties at proper times, one after the other, and so gaining a command, as it were, over the public taste. I was taken with this idea of Mr De la Rue; it showed him to be a master in his craft.

Having been conducted through the preparatory departments of the establishment, I was now introduced to what forms a principal branch of manufacture. This is the making of playing-cards, which engages a considerable number of hands, and several machines and presses. The figures on playing-cards are among the earliest things mentioned in the history of printing; and there they are, with scarcely any alteration, till the present day. While the figures, however, remain pretty much what they were, there has been a great advance in the mode of manufacture, and also in the quality of the card. Formerly, the figures were stencilled in water-colours; and some makers, it is believed, still continue this clumsy process. Mr De la Rue, some years ago, introduced the improved plan of printing the cards with inks, or colours in oil, by which means no degree of rubbing or moisture of the hand can move the figures. At one time, playing-cards were plain on the back; now, they have generally backs printed with fanciful figures; and therefore each side of the card requires its own appropriate printing. Let me first speak of the face. A sheet of paper, containing forty cards, is printed at once. If the card have figures of only one colour—as, for instance, all spades, which are black; or all hearts, which are red—then one impression is sufficient. But if there be several colours, as in the case of the honours, each has a separate impression from a differently-engraved block; the last impression completing the figure. In executing a knave of clubs, for example, they first print his eyes, and other parts about him which are blue; an impression from a second block fills in the reds; a third imparts the yellows; a fourth the flesh colour of the face; and a fifth gives the blacks. Each court-card, therefore, requires to go through the press five times; but, to save trouble, a large quantity of one colour are executed at a time. Sheets for the backs of the cards are printed in a similar manner, but on paper which has been tinted in making.

The printing of playing-cards, numerous as are the impressions they must undergo, is but a small part of the manufacture. Having seen the printed sheets carried away to the drying-room, we proceeded to the pasting process. This was a greater novelty to me than printing. I was first taken into a side-room, where were several women mingling together sheets of paper of different qualities, according to certain prescribed arrangements. When a pile of sheets was completed, it was carried away to the pasting-room. Here there were two long tables, with a number of men at work. Each of these had on his left a pile of the mingled sheets, and on his right a tub of paste. Lifting a sheet with his left hand, and laying it on the bench before him, he speedily smeared it over with the great paste-brush he held in his right; next were laid down two sheets, only the uppermost of which was pasted; and thus there arose a great pile of pasted sheets, with unpasted intervals. The whole operation was performed in a rapid and business-like way, with all the regularity of a machine. The brush, which seemed to be made of soft bristles, was as large as the besom of a housemaid, but without any handle; and I was assured that so methodic do the men become in their movements, that the brush in each case performs precisely the same curvilinear evolutions. In this manner, from year's end to year's end, do these men work away with their great broad pasting-brushes, constructing the internal part of playing-cards. Coarse as this branch of labour appears, it is reckoned one of skill, and is accordingly well-paid. The weekly wage of a good paster is about two pounds;

some can realise as much as fifty shillings. The making of the paste is a separate branch; men being constantly employed in an adjoining room, over huge cauldrons, preparing this material, which chiefly consists of fine flour; but a substance like whiting is also infused, in order to give solidity to the card. The quantity of flour consumed annually is four hundred sacks, from which two hundred gallons of paste are prepared and used daily.

The pile of sheets, while dripping wet, being taken from the paster, is placed in a hydraulic press, and being there subjected to a hard pressure, the sheets become well squeezed together. A long row of hydraulics stands behind the pasters for this purpose. The sheets are afterwards separated into boards, and hung up to dry. The pasting of the figured sheets to the front and back of the board is a final operation; and when this is done, every board consists of forty cards. There is yet, however, much to be effected in the way of drying, smoothing, and cutting. The drying-room is an extensive series of vaults, to which I was let down by an apparatus called a *lift*. The moist boards being dropped down in large quantities by this machine, are hung on poles, and dried by the heat of five hundred feet of iron pipes, through which steam from the engine is blown. To ventilate and remove the moisture from the vaults, a fan is kept constantly rotating and propelling air at the rate of 2000 cubic feet per minute. Having undergone a due baking in this warm and airy oven, the boards are lifted to a second floor, to which we shall follow them.

The second floor exhibits a busy scene of rolling and other apparatus, with great quantities of pasteboards and sheets in different stages of advancement. When a card-board reaches this department, it is for the purpose of being rendered perfectly smooth on the surface. Some persons would think that this end could be best effected by at once passing the boards under the severe pressure of metal rollers. This is a natural, but erroneous idea. On looking with a microscope at the surface of a card-board just come from the drying-room, it is found to consist of a series of small protuberances or hillocks. Now, if these were at once flattened by rollers or other means, the tops of the hillocks would be crushed down partly over the intermediate valleys, leaving minute portions of the valleys uncrushed; consequently, in shuffling cards, one would, to a certain extent, catch on another. To avert this, the card-boards are, in the first place, burnished all over with a rapidly-revolving brush, which searches into every hollow, and sweeps away any loose particles of matter. The next step is to level both sides by rollers; but here, again, a remarkable principle in mechanics is observable. Two surfaces smoothed in the same manner will not glide over each other so well as if they be smoothed differently. In smoothing the card-board, therefore, it is passed between two rollers, the lower of which is of metal, and the upper of paper; both are equally smooth, but they impart a certain variety in the dressing, to cause a sufficiently easy gliding of the cards, face and back. The paper roller is prepared in a way which no one could expect. A great pile of sheets being pasted together, squeezed to the hardest possible consistency, and dried, the mass is fixed on a spindle, and turned on a turning-lathe; the result is a smooth, round beam, the surface of which consists entirely of edges of paper, but the whole of as close a texture as a piece of finely-polished wood.

The operation of finishing is not yet by any means over. After being taken from the smoothing rollers, the boards are transferred to an apparatus for giving them a wash of certain kinds of liquid, the object of which is to harden them, and render them impervious to the moisture of the hand. Following the principle already alluded to, the wash, which has a glazing effect, is of a different kind on the two sides, although to the naked eye the gloss is the same on both. These washes being dried, the card-boards are placed between sheets of brass, and passed, a few at a time, betwixt milling-rollers. They are now carried to a hydraulic press for flattening; and here, having been subjected to a pressure of a thousand tons, they are taken out in the hard, flat, glossy condition in which they come under the eye of the public.

Removed from the pressing-room, the boards next migrate to the cutting apparatus. With this machine a man cuts them, individually, first into long slips, and next across into single cards. With such accuracy is this operation performed, that although the cutter turns out 20,000 cards in a day, all are of precisely the same dimensions. The sorting into qualities next takes place, and requires much sharpness of hand and eye. Inspected minutely as they pass through the hand, they are thrown into three heaps, from one of which are made up packs called Moguls; from the second are made up Harrys; and from the third Highlanders. The Mogul cards are of prime quality and highest price; they have no speck or flaw on either back or face. The Harrys have each a single speck on the back or face; and the Highlanders have one or more specks on both sides. Why the portraits of the Great Mogul, Henry VIII., and that of a Highlander, should have been adopted as a cognisance on packs of playing-cards, I have not heard explained.

To complete the history of the manufacture, I might say something of the wrapping-up, the paying for engraved aces of spades to government, and the exportation of untaxed packs; but all this may be left to the imagination; and it is enough to say, that of one kind or other, the concern I am speaking of makes and sells a hundred thousand packs annually. The quantity of cards paying duty issued by the different makers is, I believe, about two hundred thousand packs in the year, besides which, probably double the quantity are made and exported duty free. The consumption of playing-cards in the United Kingdom is, to all appearance, stationary, notwithstanding the continual increase of population; it would, however, be rash to ascribe this altogether to a gradual diminution of card-playing propensities. It is believed that there is a prodigious sale of cards with surreptitious stamps; and it is Mr De la Rue's opinion, founded on a knowledge of the trade, that, were the duty reduced from a shilling to threepence per pack, the government would derive ten times the amount of revenue from this branch of manufacture.

At one time Russia was one of the best customers in Europe for playing-cards; but this trade is now at an end, in consequence of that country having engaged in the manufacture itself; nor, judging from the quantity it makes away with, does this step seem unreasonable. In Russia, card-playing is a universal amusement, and will in all probability continue to be so while the people remain illiterate, and political speculation is attended with danger. To supply the demand for cards, the government took the fabrication of the article into its own hands, and with much liberality not only purchased from Mr De la Rue a knowledge of the manufacture, but induced his brother to take the entire charge of the establishment in which the cards are made. The quantity of cards thus made annually for Russian consumption is a million of packs, the profits on the sale of which are devoted to charitable purposes.

Hitherto I have spoken only of the manufacture of playing-cards, but it will be understood that visiting and other kinds of cards are made much in the same manner. Of all the varieties of cards which exist, playing-cards were the original type. Forty or fifty years ago, the only blank cards in use were the parings or other waste of cards for playing, and it was on trimmed morsels of this waste that visitors were in the habit of inscribing their names when they made a call. The fashion of leaving cards having at length established itself among our national customs, small blank cards of a superior kind were made on purpose, and now we find every variety which can be desired. Latterly, ena-

melled cards have been in vogue, and the making of these has become an important branch of Mr De la Rue's manufacture. So, likewise, has the making of railway tickets of late assumed a more than ordinary importance. Nearly all the railways in the United Kingdom procure their tickets from this establishment, each having its own pattern as respects colour and device. The card-boards for these tickets are cut by boys with such rapidity, that the eye can scarcely follow their movements. The aggregate quantity of tickets produced by the establishment is at present a million and a half weekly.

From the card-making department I was led into that which is devoted to the preparing of post-office and other envelopes; but I must postpone what I have to say on that interesting branch till another occasion.

SLIPS OF THE TONGUE.

It has latterly become so much the fashion to laugh at what has been termed the wisdom of our ancestors, that it is with some hesitation, and almost as if treading on interdicted or deserted ground, that we would venture to recall a specimen of their proverbial lore, and to relate some instances of the protection we have seen afforded to the indiscreet and unwary by the indulgent, though scarcely logical maxim, 'A slip of the tongue is no fault of the mind.' And yet it is a refreshing thought, in this working-day, scrambling, elbowing world, where every slide-backward gives room for the step-forward of another, and each mistake is a misfortune, to remember that there did exist a good old holiday time when proverbs were invented to cover unpremeditated faults, and when, as if by a magic spell, of which each heart acknowledged the potency, murmurs were hushed and suspicion cleared away by the utterance of a little sentence, simple and undemonstrative indeed, yet eloquent even to the present hour in conveying to our imaginations a picture of the blundering, cordial kindliness of more primitive times, and, from habit and association, not entirely divested of its power in our own.

Many a saying might have been chosen, evincing more shrewdness and practical knowledge of the world, though hardly a more trusting or a kinder; but, without arguing on its merits, we confess our present selection to be influenced by an early partiality acquired for this proverb, when, long before acting them had become a fashionable amusement, it was our fortune to witness a twofold performance of the adage, attended in each instance with undoubted, though somewhat dissimilar success.*

The first representation was exhibited at a dinner given by a cross and particular old bachelor, who prided himself on the precision of his household arrangements, and the excellent order of his establishment. We were seated round the table, the soup had been swallowed in silent approval, the fish with equal success had followed, and a remove was about to be placed before the master of the house, when the unlucky domestic who carried it suddenly tripped and fell, dish, cover, and contents 'in one fell ruin blent.' Portentous thunder gathered on the brow of our host, a low growl preceded its utterance, and the guests were beginning to exchange glances of discomfort at this sudden interruption of their harmony, when one of them, as ready-witted as good-natured, looking over the back of his chair, perceived the prostrate joint to be a tongue, and quietly remarked that the servant should be excused, as 'A slip of the tongue was no fault of the mind.' Amidst the burst of laughter which followed this happy suggestion, the offence was forgotten, the good-humour of our host returned, a fresh impulse was given to conviviality, and the entertainment became distinguished in a degree most gratifying to the vanity of the entertainer.

But amongst the guests there was one who, both from character and appearance, would have been imagined of all others the least likely to appreciate a witty remark, and who yet evidently enjoyed this one far beyond the rest. It might have been that his good-nature exulted in the servant's escape, or his love of ease in deliverance from the threatened storm, or else the memory of his host's irascible countenance was ludicrously impressed on the retina of his imagination; however this may be, he retained the joke long after the rest had forgotten it; and several times during the evening, to the surprise of his nearest neighbours, the fat sides would shake with stifled mirth, while over and over again he would murmur, in merry mood, 'A slip of the tongue is no fault of the mind.'

His turn to give an entertainment—for in those good old days hospitality was an established rule—soon came round, and we were fortunate enough to be included in the invitations; rather singularly too, for, with our exception, the company was entirely different from the former party, and though the variety was perhaps not altogether pleasing, yet our host was a host in himself: there he sat, his usually bland and smiling countenance now actually beaming as he hurried through the preliminary courses with an ill-suppressed impatience, which seemed to promise something super-excellent in reserve. The turbot had been ordered away, in the opinion of some with needless expedition, and expectation was now on full stretch for its successor, when, just as the dish was about to be placed on the table, once more to our surprise the servant, with a sort of deliberate awkwardness, stumbled forward, and down rolled an enormous piece of beef upon the floor.

Our host shouted with delight, rubbed his hands, and vociferated, 'A slip of the tongue is no fault of the mind.' The guests stared at him and at each other with astonishment, in which all sense of the ridiculous was lost in the apprehension that their worthy friend had suddenly taken leave of his senses. He, absorbed in his own enjoyment of the joke, failed to perceive how little it was relished by the company, until at last leaning back exhausted, and wiping his eyes, he noticed for the first time the blank countenances on either side of him. 'Eh! what is the matter?' exclaimed he: 'why are you not all laughing?' and without waiting a reply, he proceeded to relate the bon-mot of the former entertainment, adding, in the half-jealous tones of disappointed rivalry, 'I asked you all, and threw away my fine piece of beef, that we might have the laugh over again, and here you look as solemn as if you were invited to a funeral!'

The look, the tone which accompanied this confession, were alike irresistible, and the laugh which immediately re-echoed through the room amply compensated for former dulness; the worthy alderman's countenance once more expanded, he accepted the mirth excited by his blunder as a tribute to his wit, and, forgetful of his candid explanation, believes to this hour that no scene could have been better managed, no applause

* The anecdote which immediately follows we have seen many years ago in some collection of such facetiæ. Yet we have no reason to doubt that our correspondent, the writer of the article, is in earnest when she speaks of having been present when the facts took place.—Ed.

better deserved, than that which followed his much-admired impromptu.

Our attention thus early turned to this proverb, it has often since then seemed to cross our path, and ever, by its benignant influence, assisting to avert or neutralise the consequences which too often result from 'an idle word'—a word perhaps spoken in heedless inattention, the half-unconscious utterance of some preoccupying thought, and yet capable of producing effects as important as if they had been the development of some premeditated plan. We can remember making one of a large Christmas party—a family party, including aunts, uncles, and cousins to the third degree, old and young, grave and gay. Shortly before dinner, one of the busy-bodies ever found in such a collection made her way to the dressing-room of Mrs Raymond, the lady of the house, and with an exceedingly long face remonstrated with her for having invited a certain individual, as nothing could be more *mal-à-propos* than to have him thrown into the society of one of the young ladies of the party, there being undoubtedly an attachment between them, unsanctioned and unsuspected by her parents. This theme was so forcibly enlarged on, that the listener felt aghast at the idea of having involuntarily afforded facility to an affair described as clandestine and reprehensible, and went to dinner, her fair brow somewhat clouded, and her mind full of the details to which she had just been compelled to give her attention.

Her inward comfort was not much increased when, glancing down the table, she perceived the accused parties in juxtaposition at the lower end, both looking most intelligibly happy. Her thoughts became so engrossed by this contretemps, that, in speaking to her young cousin, she addressed her from the far end of the table as 'Jane Wallis,' unintentionally designating her by the name she would have borne had she and her admirer been already united in the bonds of holy matrimony. The young girl hesitated whether to answer, colouring deeply with painful consciousness, while Mrs Raymond, quite unconscious of her mistake, reiterated again and again, with some slight impatience, the question and the name. Tears were rising to poor Jane's bright eyes. Some of the relations, who half-suspected how matters stood, smiled significantly, while two or three of the youngsters laughed outright. Mrs Raymond at last perceiving something had gone wrong, looked round for explanation, and was only recalled to a sense of her indiscretion by encountering the astonished, half-indignant glance of Jane's mamma, who murmured, in reproachful accents, 'Maria! what *can* you mean?'

With blushes and confusion Mrs Raymond in vain tried to apologise. An angry spot had fixed itself on more brows than one; and an apparently trivial circumstance might have ended in a serious family quarrel, had not a good-natured old uncle come to her relief, and, interposing our favourite proverb, exclaimed, 'Come, come, 'tis not worth thinking of; 'twas only a slip of the tongue, and we all know that is no fault of the mind.'

Mrs Raymond's eyes silently thanked her warm-hearted advocate; and finding him thus able to influence opinion, the young people also retained him on their side. In the explanation which inevitably ensued, he proved the case to be much less desperate than the busy-body had anticipated. A full confession was made, parents were indulgent, friends lent a helping hand, and when, at the next festival, the family party reassembled, they all felt more united than ever. The young girl was again addressed as 'Jane Wallis,' and this time there was 'no mistake.'

Thus surely—surely our forefathers were right when they invented this charitable little covering for a fault whose punishment springs at once from the heart, and of all others requires least correction from without? —the annoyance, the awkwardness, the ridicule, are visited on the *absent* one in a tenfold degree. Honour, then, to the old-fashioned kindliness which disarmed them of their sting, and silenced the darker charge of malice before it could be made!

But of all verbal errors, that from which the perpetrator awakes of his own accord to a half-dreamy consciousness that he has made some blunder, which is all the while believed, and about to be acted on by his too credulous auditors, is the most distressing and perplexing. He doubts, yet feels too uncertain to contradict his first statement; he winds up his courage to the point of self-accusation, then retreats on the hope that he may be right after all, and his conscientious struggles are suppressed by the expediency of 'letting well alone,' until at last some convincing fact brings him to a late confession, and leaves him the victim of *his* 'world's dread laugh.'

A friend of ours, a young Englishman, was appointed to a lucrative situation in a wild and remote district of Ireland, where national habits and prejudices prevailed in a more than usual degree. Amongst other customs strange to him, he remarked that the inhabitants seemed universally to take a pride in perpetuating what he considered their semi-barbaric patronymics, and, as the most effectual method, invariably converted them into Christian names. To our friend Frank Nesbitt, however, they savoured of anything but Christianity: as sirnames, they were puzzling enough; but the second edition made confusion worse confounded; and every introduction seemed to offer a fresh personification of 'the two single gentlemen rolled into one.' For instance, there were Connor O'Neil, and Neil O'Connor; Gerald Fitzmaurice, and Maurice Fitzgerald; Donnough O'Brien, and Brien M'Donnough; in short, there was no end to those friendly transpositions, and a less persevering spirit than Frank's would have given up in despair the idea of forming a correct list of his acquaintance. Not so with him, however. Nothing daunted, he made a point of conquering the difficulty, and soon arrived at the degree of actually priding himself on the precision with which he steered his intricate way. But we have the best authority for knowing that pride goes before a fall. 'What's in a name?' is an interrogatory more easily made than answered; and Frank, before long, found to his sorrow that it was a very important question indeed.

There was a family in the neighbourhood whose acquaintance he considered particularly desirable, and, as usual in such a case, he found particular obstacles in the way. Visits had been exchanged, but always with the ill fortune of finding the parties from home; invitations had met with the same untoward fate; and an occasional meeting at the house of some mutual friend was the only progress he had hitherto made. These interviews, however, increased his anxiety for further intimacy: so at last, resolved to make assurance sure, he mounted his horse one fine day, and arrived at Overton Hall at the unreasonable hour of noon, and was rewarded for the exertion by finding the family for once at home, and, in addition, apparently quite surprised by their early visitor. A rush across the hall told of slippers and papillotes; doors were slammed, garments rustled, and quick footsteps hurried away; and Frank was at length admitted, and ushered into the drawing-room, quite provoked with himself for what looked almost like intrusion, and full of disappointment at this sudden disenchantment of his own particular dream.

But as he entered the apartment, all evil surmises quickly vanished. He found it occupied by the very person who at the moment engrossed his thoughts, and who, we may as well at once acknowledge, was the magnet that had attracted him all along. Self-possessed, and with somewhat of distant politeness, Gertrude Blake laid by her work to receive him, at the same time desiring the servant to acquaint her father with Mr Nesbitt's arrival; and Frank felt at once convinced that, whatever confusion his unseasonable visit might have caused, it certainly had not extended to the fair inmate of that room. Her simple morning dress, so elegantly

neat, her shining hair, her quiet occupation, all told of habits too confirmed to feel interruption from any casual visitor, however early; and Frank was already quite ashamed of his suspicions, and beginning to discard them as entirely unfounded, when again the door was thrown open, and, accompanied by her husband—overdressed, be-flounced, be-ringletted, and panting from the recent labours of the toilet—the real fugitive made her appearance in the portly person of Gertrude's stepmother, the second Mrs Blake.

Both she and Mr Blake entered the room, impressed with the idea that a visit at that hour from a person with whom they were scarcely acquainted could only be one of business; so, after the first greetings and usual commonplaces were exchanged, there was a pause of expectation on their part, interrupted at last by Frank himself, who with some trivial remark endeavoured to renew the conversation; but the owners of the house were prepared to listen, not to talk, and felt it would be quite superfluous and unmannerly to prolong any subject which might lead away from the point at issue. Thus effort after effort on Frank's part died away: he inwardly pronounced them the most stupid beings in existence; and instead of starting fresh subjects, would have started himself, were it not for the occasional support he received from Gertrude, who now and then, with a word or a smile, relieved the awkwardness, and encouraged him to remain. But this heedless courtesy was soon checked by a frown from her stepmother; and, in obedience to the signal, the long, bright curls swept the embroidery frame, as her fair head was bent over it, to be raised no more. Paganini being the only person we ever heard of who could produce much harmony from one string, we must not wonder that Frank Nesbitt's solitary efforts were at last disconcerted: impatience on the other side was fast conquering politeness, and a few moments more might have introduced remarks more inquisitive than satisfactory, when suddenly recollecting a piece of news he had heard that morning, Frank exclaimed in a tone of animation rather unsuitable to the subject, 'Did you hear of Donnough O'Brien's death? He was killed by a fall from his horse out hunting yesterday.'

In his eagerness to communicate some piece of intelligence, Frank entirely overlooked the possible consequences. But had a shell exploded in the quiet apartment, it could hardly have produced a greater commotion. His attention was first arrested by an exclamation from Gertrude, who, with pale cheek, and eyes opened to their fullest extent, gazed at him for a moment, then colouring deeply, bent in silence over her work again. Mr Blake gave him a glance of intelligence, which plainly said, 'At last the murder is out!' though at the same time it seemed to say that their curiosity might have been relieved with less abruptness. But all was nothing in comparison of the effect on Mrs Blake. She was just that sort of overgrown, florid, unwieldy-looking person, to whom any sudden agitation is overwhelming; and before a word could be spoken, or a question asked, she had fallen back in her chair, the thick gurgling sound of her sobs burst upon the ear, violent hysterics succeeded, and, amidst a scene of confusion and agitation, her husband, assisted by Gertrude, bore her from the room.

Frank remained behind, quite thunderstruck with this sudden change of affairs. No word of explanation had passed, no time had been given for apology, and feeling that though his conversation could no longer be considered uninteresting, it would surely be condemned as unfeeling, he awaited Mr Blake's return with some anxiety, to remove that impression. But matters were apparently very serious; for though he lingered more than an hour, and saw servants occasionally hurrying to and fro with much bustle and excitement, yet no one came near him; so, concluding himself forgotten, he was about to take his departure, full of self-reproach for his thoughtlessness, when Mr Blake re-entered the room.

The old gentleman apologised somewhat coldly for his lengthened absence, saying that he could not leave Mrs Blake, as she had been quite overpowered by the sudden news of Mr O'Brien's death, who was a particular friend and favourite of hers, and indeed a distant relation, but that she was now rather more composed, and he had left her to Gertrude's care.

Frank expressed his regret truly and earnestly at having spoken so inconsiderately; and then with some surprise Mr Blake became aware that the intelligence had been given quite inadvertently, as a mere piece of gossip, and in perfect ignorance of the sensation it was likely to produce. The formality of his manner vanished at once, and partly compassionating Frank's evidently genuine distress, and partly amused at his dilemma, he hastened to reassure him, and begged he would not give himself any further annoyance on the subject. 'Indeed, my dear fellow,' he frankly added, 'we took it for granted your early visit was purposely to break to us the news of this unpleasant casualty; and I was surprised, and I may now say half-angry, at your want of caution; but I am quite glad to find myself wrong, and that you knew nothing of the connexion. You must come out some other day, and make your peace with Mrs Blake. As to Gertrude, I believe you will find that no difficulty; for, to tell you the truth,' continued he, growing quite confidential, 'it was one of my wife's favourite plans to bring about a match between her and O'Brien. I may mention it, now that the poor fellow is gone; but I know my daughter was a good deal teased on the subject; and though I did not like to interfere, still it lessens my regret.'

With varied feelings Frank listened to this communication. As Gertrude's dimples and hazel eyes flitted across his memory, he might have echoed her father's concluding words, and said, 'It lessens my regret;' and could Mr Blake have read his heart at that moment, he might not so easily have acquitted him of *malice prepense*: but fortunately we do not walk this world with glass windows in our bosoms, so there was perfect unsuspicion in the grasp with which he shook his young friend's hand at parting, and entire cordiality in his tone, when, as if to make amends for former injustice, he invited him to come soon again, and spend any day that he had nothing better to do.

Frank rode away, and for a mile or two proceeded with some rapidity, as if to leave behind the memory of the unpleasant scene he had occasioned, and the feelings it had called up in his own breast; but relaxing his speed at the foot of a long ascent, he found himself leisurely recalling the circumstances of his visit, and reverting to their original cause. Suddenly the thought darted into his mind, was it really Donnough O'Brien who was killed? or was it some other one of those provokingly similar names he should have said? He started at the idea, and tried to repel it as an absurdity. But it would intrude, and the more he pondered, the more uncertain he grew; at one moment confounded as he considered the consequences of such a mistake, at the next laughing at it as a trick of the imagination. He again accelerated his horse's pace, and eagerly looked out for some acquaintance to put him out of a suspense that was becoming almost intolerable; but, as it happened, he did not encounter one familiar face, and his agitation increasing at every step, he was several times on the point of accosting some stranger with the inquiry which now entirely engrossed his thoughts. Fearful, however, of committing himself further, he refrained; and at last, just at the entrance of the town where he resided, he met a friend, and hardly returned his greeting before he hastily bolted out the question, and had his worst apprehensions confirmed by the answer given, with some surprise, in the negative.

'Nonsense, man,' he replied vehemently; 'he is dead, I am sure: he must be dead: he was killed out hunting yesterday.'

His friend looked at him for a moment, as if doubtful of his sanity, then answered quietly, 'You are quite

mistaken, Nesbitt. Brien M'Donnough was killed; I am to be at the poor fellow's funeral to-morrow; but I was speaking to O'Brien not an hour ago: he was perfectly well, and going to dine at Blake's to-day! 'Tis said he has a fair attraction there. Believe me,' added he laughing, 'he is alive and well, and not the sort of man to let you kill him with impunity.'

There was no longer any room for incredulity. Frank hurried home, and, in addition to his morning's murder of Donnough O'Brien, committed a wholesale breach of the sixth commandment, by fervently wishing every Mac, O', and Fitz, fathoms deep in the bog of Allen. The following morning he was called *on*, and would have been called *out*, by O'Brien, had not Mr Blake modified his anger by quoting our proverb. Its acknowledged authority influenced opinion, and even saved Frank Nesbitt, on being acquitted as a slanderer, from being convicted as a fool. The 'slip of the tongue' being granted, Mr Blake contended that 'it was no fault of the *mind*,' and thus doubly saved his young friend's reputation.

But he was condemned, during O'Brien's visit, to feel that he cut rather a silly figure while congratulating the man on his revival, whom he had slain with a breath, and listening to his humorous description of the sensation caused by his arrival at Mr Blake's. He had to laugh at the joke, though it was no joke to him when he encountered the history of his blunder in every circle he entered. His good temper and light heart, however, carried him through all, even through the difficulty of making his peace with Mrs Blake. For some time he did not dare to venture into her presence; but at last he received information that her prejudice had been overcome by the influence of an unexpected ally. A flag of truce was extended, and under that fair banner he was soon able to set all ridicule at defiance, and to return the witticisms of his acquaintance with the assurance that 'those may laugh that win.'

It was a saying of Catherine le Medicis, that a false report, believed for three days, might save a nation. She had studied human nature, and knew it well. So, as little things may be compared with great, Gertrude Blake experienced the truth of the maxim, and made such good use of her three hours' mistake, as to render her position for the future impregnable. In the first excitement of feeling, mutual confidence arose between her and her really warm-hearted stepmother, and the latter mingled with her lamentations for her friend sincere contrition for having persecuted Gertrude on his account, and faithfully and voluntarily promised never to interfere on such a subject again.

We need hardly add, that O'Brien found it impossible to regain the footing he had lost. His hopes were dead and buried, though he himself survived. So, as in his country a prophetic import is attached to the accidental report of a death, he left its fulfilment to his departed project, and sought for consolation in another quarter. Frank soon occupied the vacant ground; and in proportion to the declension of O'Brien's interest, his gained the ascendant. Gertrude Blake, with her usual animation, undertook his defence. She found herself a gainer by his error, and, in gratitude, could not allow him to suffer loss; so she lectured him on genealogy, and offered to teach him the brogue; laughed to himself at his blunders, and excused them to others. Her lessons daily became more attractive, her pupil more interested; until, under such tuition, he at last declared himself 'more Irish than the Irish!' and in the end fully convinced his fair instructress in the first instance, and through her the neighbourhood at large, that though their acquaintance had commenced with a 'slip of the tongue,' he could speak most effectually to the purpose when once he had a mind.

Lord Bacon has observed that 'the genius, wit, and spirit of a nation are discovered by their proverbs.' Let us trust that our present generation, in the midst of its improvements and acquirements, may not, in deeming itself wiser than the ancients, entirely reject the character thus established by a good old race, or despise the warm-hearted kindness which must have prompted our homely proverb, and the charitable forbearance it may opportunely enjoin.

RESISTANCE TO GREAT TRUTHS.

HARVEY AND THE CIRCULATION OF THE BLOOD.

It has not unfrequently happened that, at wide intervals of time, certain speculative or inquiring minds have had glimpses of a truth—of some great natural fact. They have seen an effect, without being able to trace it to a cause—a portion of an outline, of which they were unable to make a finished picture. A long descent through many brains has seemed to be necessary for the entire elaboration of the principle; and although there may be something grand and startling in the discoveries which at times flash upon the world as the result of hazard, yet those which have been the work of thought, observation, deduction, and experiment, carried on laboriously through many years, forcing their way, as it were, into existence, are not the less worthy of our respect and admiration.

The history of the discovery of the circulation of the blood by our countryman Harvey, presents itself as an interesting illustration of the views here thrown out. Constituting, as it did, a fact of the highest importance in the human economy, giving a new form and purpose to physiological science, it nevertheless met with the usual fate of great truths, being received with ridicule, jealousy, and detraction.

William Harvey was born at Folkstone, in Kent, on the 2d of April 1578. He acquired the elements of learning at a school in Canterbury, and finished his education at Cambridge. Eldest of a family of nine, he was the only one who manifested any inclination for science. Having determined on devoting himself to medicine, he set out, at the age of nineteen, on his travels to France and Germany, visiting the principal anatomical schools on his way to Italy, in which country he studied anatomy for some years under the celebrated Aquapendente, founder of the school of Padua. Harvey devoted himself zealously to this pursuit. Before his time, anatomy had been nothing more than a speculative science, distorted by many absurd and superstitious notions; and the hindrances opposed to the dissection of the human subject, proved a formidable impediment to more accurate or rational researches.

Aquapendente had noticed the valves of the veins in his dissections, but it does not appear that he had any idea of their real use or importance. The sight of these was doubtless the cause of Harvey's investigations, and moved him, as he says, to write, 'to find out the use of the motion of the heart; a thing so hard to be attained, that, with Frascatorius, he believed it known to God alone.' He goes on to say—'Almost all anatomists, physicians, and philosophers to this day, do affirm, with Galen, that the use of pulsation is the same with that of respiration, and that they differ only in one thing—that one flows from the animal faculty, and the other from the vital, being alike in all other things, either as touching their utility or manner of motion.' It is evident that he was not unwilling to do justice to the labours of his predecessors, for elsewhere, to use his own words, he is thinking 'to unfold such things as have been published by others; to take notice of those things which have been commonly spoken and taught, that those things which have been rightly spoken may be confirmed, and those which are false, both by anatomical dissection, manifold experience, and diligent and accurate observation, may be amended.'

Once on the track, Harvey followed it up with unflinching perseverance: new facts came to light, and cheered him on with the hope of ultimate success. 'Observing,' he remarks, 'the valves in the veins of many parts of the body so placed as to give free passage to the blood towards the heart, but to oppose the

passage of the venal blood the contrary way, I imagined that so provident a cause as nature had not thus placed so many valves without design.'

At length Harvey believed he 'had hit the nail on the head;' and having become a Fellow of the College of Physicians at the age of thirty, he was appointed professor in 1616, when he commenced a course of lectures, and for the first time modestly announced his great discovery of the circulation of the blood. Content to go no farther for a time than in the hints thrown out, he waited with patience, until time had fully matured his views, before he gave them to the world. In the year 1628, when he was fifty years old, his researches were first published at Frankfort, in a small quarto volume, entitled *Exercitatio Anatomica de Motu Cordis et Sanguinis*,* dedicated to Charles I. In this work, as has been truly observed, 'Harvey, by his genius, followed nature in her windings, and forced her to unveil herself.' 'Scarcely one of the proofs which demonstrate the circulation escaped his researches; he showed it not only in certain parts, but followed it to its recesses—to the liver—where other anatomists had lost themselves. His book is one of the rare essays which exhaust the subject; it is short and comprehensive, clear and profound, dictated by reason and experience.'†

He had diligently and perseveringly extended his inquiries beyond the human subject, with a view to verify his facts by comparison. The king, who, with all his errors, entertained enlightened views on science generally, placed at his physician's disposal the deer in the royal parks near London; and in addition to these, the zealous anatomist minutely examined the hearts of other mammalian animals, as well as of birds and fishes. His book contains an explanation, in clear and concise language, of the general mechanism of the circulation, and incontestable proofs of the truth of his theory. His own words will best convey the certainty and accuracy of his views. In the chapter on the action and office of the heart, he remarks—'First of all, the ear (as the auricle was then called) contracts itself, and in that contraction throws the blood with which it abounds, as the head-spring of the veins, and the cellar and cistern of blood, into the ventricles of the heart.' After its passage through the lungs and body, 'it returns to the heart, as to the fountain or dwelling-house of the body; and there again, by natural heat, powerful and vehement, it is melted, and is dispensed again through the body. The pulse of the arteries is nothing but the impulsion of blood into the arteries.'

Harvey's biographer, Dr Friend, writing on the discovery, observes—'As it was entirely owing to him, so he has explained it with all the clearness imaginable; and though much has been written on that subject since, I may venture to say his own book is the shortest, plainest, and the most convincing of any.' We find the celebrated Boyle, who was contemporary with Harvey, not less candid. He remarks in his philosophical works—'Late experiments having shown the use of the blood's circulation, and of the valves in the heart and veins (which, the famous Dr Harvey told me, gave him the first hint of his grand discovery), we at length acknowledge the wisdom of the contrivance, after it had escaped the search of many preceding ages.'

The extreme care with which Harvey must have pursued his inquiries, may be best understood by what is perhaps the most striking phenomenon in his important discovery—that of the independent motion and life of the blood itself. He noticed the gradual cessation of movement in the ventricles and auricles in dying animals, and goes on to say—'But besides all these, I have often observed, that after the heart itself, and even its right ear, had, at the very point of death, left off beating, there manifestly remained in the very blood which is in the right ear an obscure motion, and a kind of inundation and beating.'

It might be supposed that a discovery of this nature presented nothing to shock the prejudices, or disturb the interests, of any portion of the community. Yet, as remarked in Wotton's Reflections, 'a great many put in for the prize, unwilling that Harvey should go away with all the glory.' A host of those who are 'always ready to combat facts by reasoning,' fell upon him. He was overwhelmed with contradictions from the learned, and neglected by the public generally; and as soon as his claims were contested, his practice as a physician materially diminished. Such was the acrimony of his opponents, that he was denounced to the king as guilty of improper dissections; an accusation which, had he not enjoyed the favour of the sovereign, might have been attended with fatal consequences, in a day when violent prejudices prevailed against experiments on the human subject. Many asserted that the discovery was nothing new; that it had been known long before: others contended for the honour as due to themselves; and some referred it to Hippocrates, from whom Harvey was said to have stolen it.

The ancients, in reality, knew neither the theory nor the laws of the circulation. They entertained the most absurd ideas on many physiological and anatomical points relative to this phenomenon, and were altogether ignorant of the important part played by the lungs in this great function. The Chinese were said to have been acquainted with the movement of the vital fluid from time immemorial; an assertion which appears to have solely rested on the attention always paid to the pulse by that singular people. Hippocrates is the earliest author who makes any allusion to the subject; he speaks obscurely of the usual motion of the blood and distribution of the veins. Plato represented the heart as a species of divinity, that poured out blood to every member of the body; and Aristotle, who uses the word *arteria* for *windpipe*, speaks of a recurrent motion of the blood, comparing it to the ebbing and flowing of the sea in the well-known channel of Euripus: these opinions were, however, founded on mere conjecture, not on actual demonstration. Galen, who believed that the veins originated in the liver, endows the body with 'three kinds of spirits, natural, vital, and animal, corresponding to the same number of faculties or functions.' The seat of the natural was in the liver, for the growth and support of the body; the vital he assigned to the heart, for the development and carrying about of heat; and placed the animal in the head, as the source of sensation and motion. The arteries were supposed to be nothing more than passages for air or 'spirit,' as after death they were found empty; from which circumstance they derive their name. Cicero, in his treatise, *De Natura Deorum*, has the phrase—'Sanguis per venas, et spiritus per arterias.'

These doctrines prevailed until the time of Servetus, who, better known as a theologian than physician, fell a victim to the religious fanaticism of the Calvinists of Geneva. His writings contain many remarkable facts; among others, a description of the pulmonary circulation, with which it appears he was imperfectly acquainted. His suppositions, however, were not founded on actual experiment. Like Galen, he made the body the abode of three spirits; one of which, the aërial spirit or pneuma, was seated in the heart and arteries. After Servetus, Columbus, a physician of Cremona, threw further light on the circulation through the lungs, yet he remained entirely ignorant of the part played by the arteries. To him we are nevertheless indebted for a description of the uses of the valves of the heart. He was followed by Cæsalpinus, first physician to Pope Clement VIII, who held some clear views on the subject; but being continually engaged in scholastic disputes, his allusions to it are, in most cases, incidental and obscure; and notwithstanding his verification of the labours of his predecessor, his works abound in glaring

* Anatomical Researches on the Motion of the Heart and Blood. Haller called this work *Opusculum Aureum* (small golden treatise).

† Senac. Traité du Coeur.

errors. With the exception of applying a ligature, below which he noticed the swelling of a vein, he appears to have added nothing new to the theory of the circulation.

Amid all this ignorance of the true functional action, the wildest speculations prevailed. The heart was taken as an oracle, and its beats were listened to as prophetic. Some contended that the use of the veins was merely to keep the blood in equilibrium, and prevent undue accumulation in any part of the body. Others, again, bewildered themselves with calculations on the power of the heart, and believed that it exerted a force equal to 3,000,000 of pounds; a notion speedily combated by a third party, who proved, to their own satisfaction, that the power did not exceed eight ounces. Although modern science has stripped off these marvellous attributes from what Senac calls 'the material soul of living bodies,' and made it a hydraulic machine, yet we find no less cause for wonder and admiration at its mysterious powers.

To return to Harvey. It was for removing this mass of error, for laying bare the most admirable mechanism the world has yet seen, that he was assailed by the envious and ignorant from every quarter. How well he did his work, we learn from Jenty, according to whom, he, 'with indefatigable pains, traced the *visible* veins and arteries throughout the body, *in their whole* progress from and to the heart, so as to demonstrate, even to the most incredulous, not only that blood circulates through the lungs and heart, *but the very manner how*, and the time in which that great work is performed.' To this 'indefatigable pains' we doubtless owe the six large diagrams, of the size of life, still preserved in the College of Physicians, showing all the blood-vessels of the human body; and prepared with such nicety, as to display distinctly the semilunar valves at the entrance of the aorta, by which he used to illustrate his lectures. The delivery of these lectures, however, involved him in much suffering and loss. In the confusion and riots of the civil war, his house in London was pillaged and burnt, with many valuable papers, whose destruction was irreparable, and caused him constant regret. 'In the eyes of his contemporaries, he was looked upon only as a dissector of insects, frogs, and other reptiles.' And on the authority of Aubrey, we learn that Harvey said 'that, after his booke of the Circulation of the Blood came out, he fell mightily in his practice. . . . 'Twas believed by the vulgar he was crackbrained; and all the physicians were against his opinion, and annoyed him.'

The persecution of Harvey appears to have been prompted only by the mean passions of his contemporaries. No other motive is obvious; for it is difficult to see in what way 'the craft' was endangered. In his case, however, as in many others, it almost appeared as if men had some strong personal interest in keeping back the truth, so eagerly did they exert themselves to resist it. Carrere, rector of the academy of Perpignan, wrote a thesis against the doctrine. It was also attacked with great virulence by Dr Primrose, and by Riolan, the celebrated French anatomist. Harvey nevertheless found friends. Folli, physician at the court of the Medici, the first to attempt the transfusion of blood, was an ardent propagator of his theory. In his own country, he gained a powerful advocate in Sir George Ent, who published a book in his favour. The 'momes and detractors' were also replied to in temperate language by Harvey himself. He says—'I think it a thing unworthy of a philosopher, and a searcher of the truth, to return bad words for bad words; and I think I shall do better, and more advised, if, with the light of true and evident observations, I shall wipe away those symptoms of incivility.' To those who taunted him with being nothing more than a dissector of insignificant reptiles, he replied, with as much truth as impressiveness, 'If you will enter with Heraclitus, in Aristotle, into a work-house (for so I call it) for inspection of viler creatures, come hither, for the immortal gods are here likewise; and the great and Almighty Father is sometimes more conspicuous in the least and most inconsiderable creatures.'

Harvey attended the king in his journeys during part of the civil war, and was present at the battle of Edgehill. He afterwards retired to London, in the neighbourhood of which city he passed the remainder of his days. In his seventy-fifth year he built and endowed a library and museum for the College of Physicians. He died in June 1657, at the age of seventy-nine, but not before the truth of his doctrines had been generally recognised; and his own professional brethren were proud to do him funeral honours. He was buried at Hempstead, where a handsome monument, surmounted by a marble bust, was placed over his grave by the College of Physicians. It was said of him that 'his candour, cheerfulness, and goodness of heart were conspicuous in his whole life, as well as in his writings, and exhibit a worthy pattern for future imitation;' and that one of his noblest characteristics was love for his profession, and a desire for the maintenance of its honour.

What a striking commentary do these facts afford on the ignorance and selfishness of society! How easily have the many suffered themselves to be led by the interested few, whose motives were too often of the most despicable character. This is the more to be wondered at, as experience, if not policy, might have dictated the question, *cui bono?* How was this answered in Harvey's case? Hobbes says of him, he 'is the only man I know, that, conquering envy, hath established a new doctrine in his lifetime'—and yet twenty-five years elapsed before this was accomplished. For a quarter of a century had this great truth to struggle against the malice, jealousy, and stupidity of its enemies, who denied the discoverer's claim to originality, with as little reason as those who disputed Galileo's discovery of Jupiter's satellites, on the ground that a Dutchman had previously invented a telescope. Mankind, however, have always been prone to persecute new truths; whether they shall continue to do so, depends greatly on the present generation.

Harvey's reputation has now nothing to fear. The circulation of the blood is universally admitted to be the *first* great discovery after the promulgation of the Baconian method; and though giants in mind have lived since, with all the facilities which use and example in the inductive method have given, only one greater and more complete discovery—the discovery of gravitation—has ever been made.

LOVE-LETTER EXTRAORDINARY.

WHAT a charming sight is a little corner of a fly's wing when one looks upon it with the aid of a microscope! How perfect in design—how dainty in detail—how glorious in effect! One hangs with rapture over the examination of its beauties. But just for a moment lift away the microscope, and lo! a dead, thin, distorted insect, than which scores of plumper, prettier specimens buzz hourly upon every window-pane in one's house. Now, thousands of people have made this remark, and yet, perhaps, it has never occurred to any of them that Cupid has just such another microscope of his own; and thus we bring it home to him. Who ever fell in love with a whole woman at once? No man: the task would be superhuman. Every man's heart is caught, after its own weakness, by some particular charm, which, as ladies say, 'grows upon him.' For example—Brown, Jones, and Robinson, are rivals for a girl's affection: but examine their respective admirations a little closely, and they shall not be rivals at all. Her ringlets have entangled one of them, her little foot has walked into another, and her figure has added a third to her admirers. The gentleman who used to write sonnets to his mistress's eyebrow (and *only one* of them) was a

genuine type of your true lover; so enamoured of his own one beauty, that he cannot for a moment divert his eyes to any other district of his lady's charms. This is a law of nature: it is, in fact, Cupid's microscope; very much developing something somewhere, and shutting quite out of sight everything anywhere else. And to show its universality, witness the cheerful complacency with which the dear creatures themselves crouch in the tenderest attitudes under the displaying glass of their exhibitor; it is the whole art of love in woman. Unhappily, the crisis comes when Hymen smashes the lens at the church door (on the way *out*), or when Cupid himself, pocketing the whole contrivance, flies away to show off his science again in the same manner upon some other couple.

Now, to us it is a touching thing to see young folks going about falling in love with each other after this fashion, for qualities to which they will be less than insensible in a fortnight after their honeymoon. Unluckily, we can see no help for them. People in love can't be expected to listen to reason; they may perhaps be accessible to it after marriage, but then it is only an aggravation; no longer a remedy. The only plan we can suggest, is to pitch good advice into them *before they fall in love* by some sort of 'contingent hints on courtship and matrimony,' or 'prospective precautions about sweethearts, addressed to heart-whole bachelors.' In this age of handbooks, such titles would be worth any money to an enterprising publisher. At present, however, we have concocted and struck out *only* the titles, and as we have not the slightest idea of going any further with the undertakings, we just register them here 'provisionally.'

Next to not being disappointed at all, perhaps the greatest satisfaction in the world is to have a good right to be disappointed. Now, the man who recklessly resigns his heart without specifying its weaknesses, has no more reason to complain of its subsequent injuries, than he who suffers his housemaid to 'dust' his mantelpiece, or who sends glass anywhere by carriers without instructing them as to which 'side up, with care.' In order, then, to establish before wedlock the right we speak of—in order, as it were, to unlock his heart, and leave the key in it, before he knows to whom he shall part with it—we can imagine some young bachelor, foreseeing the altar, addressing to her whom time reserves for him a letter of preliminary candour. To be sure he can't send the letter, because he doesn't know where to direct it. He is equally ignorant of the lady's name and of her number. But we—we will make sure of its reaching the right individual, by placing it before the world—as follows:—

'To ——— ———

'MADAM—Permit me to request your serious attention to a few remarks, of a very peculiar nature, from one who is at present a total stranger to you. But first, as it is just possible that you may consider I presume considerably in thus addressing you, I will try to excuse my freedom. The fact is, that you and I are going to be married—some of these days. Yes, madam, although I am the last man that would force his attentions on a lady, I feel I must be your husband. You intend to marry when you shall receive an eligible offer? Very well; you will receive such an offer. I shall make it. I shall not be able to make it to anybody else. You will turn it over in your mind a long time, but you will—you must accept it at last. It is not in us to help it: man and wife we are already—not yet united, it is true, but still some day to share, like a pair of unconsciously-associated soles, a mutual fate. It is not, then, very premature in us now, while we are still in the chrysalis of celibacy, to begin to think of each other and to try to imp the wings of inevitable wedlock for a pleasant flight together—is it, dear?

'You are very pretty, I'm sure (I shall call you an angel some day, so don't be precipitate); but I hope that, when I fall in love with you, you will not think it necessary to show me how very lovely you are by demonstrating what a beauty you are thought by all the young fellows of your acquaintance. You will make me ineffably happy by marrying me; but I trust you will not seek to aggravate my gratitude by acquainting me with all the very numerous offers you will have had from richer and handsomer men than I am—all of which, no doubt, your dear mamma will have been most anxious for you to accept in preference to mine. I shall love you to distraction, and you will reciprocate my passion (probably after the manner of Mr James's heroine in his next novel but thirty); but I beg you will not permit your imagination to invest me with the peculiarities of any exile, or bandit, or cavalier of the fifteenth century, because such impressions must lead only to your disappointment and my subsequent depreciation in your eyes, as I assure you I have not the slightest element of any such gentleman in my composition.

'When you find yourself for the first time at the head of a household, though never so humble an one, you will very naturally be overcome with a delightful responsibility in the cares of your little queendom. Judging from my present circumstances, I think that, "when we marry," we shall probably afford "an eight-roomed house, genteelly furnished." But the path of youth should ever be upward; and I trust and expect, at no distant period, to remove you to a "twelve-roomed ditto, luxuriously." Therefore I hope that, in our first nest, your callow housewifeship will not proceed with uncomfortable thrift to envelop our looking-glasses in yellow gauze; pop our bell-ropes into long striped bags; disguise our chairs in mysterious dominos; and make me walk *over* my domestic hearth upon raw brown Holland. I hate to see people's "genuine effects" so muffled: it reminds me of the way tradesfolks have of wrapping up one's copper change.

'As young ladies go now-a-days, it is very likely that your disposition, my love, may be overwhelmingly "serious." Some women have religion always in their mouths, as if it was a voice lozenge. If so—be it so. Mine shall never be the bed of a Procrustes, seeking to stretch his wife's conscience. Perhaps if I jerk a button from my wristband on a Sunday morning, your piety will forbid you to stitch it on again. Then never fear a consequent rebuke from me. I, rather than engage in a controversial discussion with my wife about my buttons, would with the greatest cheerfulness—wear studs.

'One of the proudest prerogatives of female matrimony is what ladies call "mutual confidence." But if, in your notion of this privilege, you should expect me, in my used-up evenings, to pour into your bosom my troubles and anxieties in "the city," and, in return for your sympathy, to share with you the annoyances of housekeeping—if you should repay my confidence, in the matter of my best friend's bankruptcy, with a particular account of an "extravagant shoulder of mutton," in which bone unconsciously preponderates over meat—if, when I try to explain to you my current position in a lawsuit, you should interrupt me with your just vexation that your maid has mimicked in gingham what you invented in satin—in such a case I must beg that we keep our separate trials quite separate. We might as well exchange with each other the umbrella and the parasol, the peacoat and the pattens, as expect to find shelter in such uncongenial comfort. So much for our troubles. Let us, however, be always unanimous in our pleasures: let us enjoy everything together; with this especial precaution—that there is always enough for both of us to enjoy.

'I own I could wish that, until we marry, you should have some regular occupation: but of course, as you are a lady, you would blush at the idea of earning your bread. Nevertheless, I hope you will never have the unfeeling vanity to wince at the name of my trade—even though it should involve an apron—as if it were a thing not to be admitted before company. For you will meet, my love, much stylish company in London, whose tools of business are Shylock's own knife and scales, yet who would shudder at the imputation of a yard-measure or a canister. But be sure, the tradesman's wife who loves such company, hears daily baser metal rung upon her dinner-table than ever her husband nails to his counter in Cheapside.

'And now, my dearest girl that shalt be, pardon my

audacity if, as I bend my mind's-eye into the vista of futurity, a little past the altar I perceive the cradle. Yet why not? The tree of our love, though now but an acorn, must shoot and blossom, and then—only think of the branches! With our little ones (bless 'em), even from their coral, let us do nothing without a purpose. Wise men say that the mind of a child resembles a sheet of white paper. It is then a parent's duty to be sure that the guiding-lines he traces on that sheet of paper are always ruled in the right place. The world has a very harsh way of rubbing out false impressions.

'I drop my pen. Good-by, my love, *au r'écrire*. This letter is as ingenuous as the next I shall write to you will be silly and incredible. Nevertheless, I am afraid you will like the other best. Your devoted,

THOMAS RINGDOVE.'

AN EASTER RAMBLE IN THE NETHERLANDS.

THIRD ARTICLE.

COMMERCIAL PROSPERITY OF ANTWERP—THE DUKE OF ALVA'S ATROCITIES—HIS STATUE, AND THE BRONZE CRUCIFIX—THE CHURCH OF THE JESUITS—A GOSSIPING CICERONE—THE CALVARY—MENDICITY IN CATHOLIC CHURCHES—THE ANTWERP ACADEMY—RUBENS'S FAMOUS PICTURE—HIS DEATH AND FUNERAL—HIS DOMESTIC HABITS.

IMMEDIATELY above the grand door of the Antwerp cathedral is a bronze crucifix, the history of which is somewhat curious, as it was cast from the metal of the statue which the infamous Duke of Alva ordered to be erected of himself in the citadel. When the Emperor Charles V. resigned his imperial diadem, his son, Philip II., on ascending the throne of Spain, found the Netherlands in an affluent and prosperous condition. In this small portion of his vast dominions he could enumerate three hundred and fifty cities surrounded by walls, and about other three hundred open towns, which were all wealthy and populous. Among them Antwerp, from its immense dealings in the woollen and cloth trade, was considered to be 'the great mart' and 'pack-house of Europe;' frequently, as we have already premised, as many as two thousand five hundred vessels were seen at the same time anchored before the town, and three or four hundred vessels came up with one tide into the Scheldt. We are also informed that two hundred wagons came daily into the town, loaded with passengers from the neighbouring provinces; nearly one thousand of whom—French, German, Italians, and other foreigners—arrived weekly. Furthermore, it is stated that one hundred thousand country carts were continually employed carrying goods to and from the city. Thus did Antwerp not only become rich itself, but contributed to enrich other towns in the Netherlands; in the midst of all which opulence, every branch of the fine arts was assiduously cultivated. The wealth of the bishops and priests, and the zeal of all classes of people to see their churches embellished with the finest works of art, created an immense demand for pictures on sacred subjects. Nor was the sister art, music, neglected. On the contrary, Guicciardini states that Flanders then supplied all Europe with musicians, just as Italy does at present.

Such was the prosperous state of these towns when the Duke of Alva was appointed by Philip II. commander-in-chief of the armies in the Netherlands. He was then sixty years of age, and had the character of being a haughty, morose, severe soldier. He no sooner entered upon his odious mission, than he revealed, to the consternation of the people, the unlimited authority with which he was vested; and which extended not only over every department of the army, but over the judicial institutions of the country. The most gloomy apprehensions now became too soon realised. He established the Inquisition, as it already existed in Spain, with all its attendant and secret horrors; he confiscated, on frivolous pretexts, the estates of the nobles and the property of rich merchants; and imposed upon the industrious classes the most heavy and vexatious imposts. Finally, he abolished the office of the ordinary judges, and delegated their duties to a tribunal of twelve counsellors, nominated by himself, who, with the sanguinary Vergas as their president, sanctioned, with the mock solemnity of a pretended trial, his secret, tyrannous instructions. The Duke of Alva himself boasted that, during less than six years of his sovereignty, he had caused more than eighteen thousand persons to perish by the executioner. Here the reader may naturally enough be curious to know what could have been the design of a monument erected to the honour of so execrable a tyrant. Accordingly, we find it was executed under his own immediate orders, and doubtless intended as much to intimidate the inhabitants, by reminding them of the inordinate power he wielded over them, as to gratify his own insensate ambition. He was represented, according to Mayer, as Duke of Alva, in a menacing attitude, treading with one foot on the neck of an image representing the rebellion of his subjects, and trampling with the other upon the neck of another image, intended to represent expiring Protestantism. Around the pedestal was a basso-rellevo, which represented the citizens in supplicating postures, with the wallet and porringer suspended round their necks, to imply the most abject and humiliating submission to his authority. Such is the account we have been enabled to gather of this memorable statue, which, when destroyed by the successor of Alva, with the view of conciliating the town, was, strange to say, melted down into the crucifix which is now seen above the cathedral door.

We went in the afternoon to the church of the Jesuits, the vast interior of which was so crowded, that we could scarcely wedge our way through the dense congregation into the nave. As a specimen of Rubens's talents in a line apart from that in which he gained his fame, the architecture of this church has a claim to attention. Injured as it has been by lightning, we still recognise in it the genius of the great artist. Finding that we could not obtain seats, and being inconvenienced by the crowd, we left the church of the Jesuits, and proposed going to St Paul's; and as, for this purpose, we were descending the flight of steps under its portico, we observed an intelligent young woman also leaving the Jesuits, of whom we inquired our way. We were glad to find that she understood us, and spoke good English; for in the streets of Antwerp, and other towns in Belgium, the chances are, that in accosting a passenger to make any such inquiry, the return made will be a shake of the head, accompanied by a jargon half Dutch, half French, half Walloon, which is utterly unintelligible. We were, however, on this occasion more fortunate; for she with much good-nature replied that she lived close by St Paul's, and would, if we permitted her, accompany us. We availed ourselves of her offer; and as we walked along, she observed that the church of the Jesuits was always crowded, for 'notwithstanding,' added she with much animation, 'all that has been said against them—and they have been a persecuted race—they are, at least in Antwerp, a good people.' 'And how so?' we inquired. 'Because,' answered she, 'they are so charitable to the poor; they will do almost anything for them: many of them will even look to the education of their children: and whenever any affliction happens in their family, the poor people always advise one another to seek out some "bon père Jesuit," from whom they are certain to obtain relief.' Thus did our gossiping cicerone, who descanted fluently enough on their merits, unconsciously hit upon the great secret which explains the influence of the Jesuits throughout Europe. The success of their missions when Francis Xavier was performing miracles, and pouring the water of baptism over the heads of the converted infidels in the East, may have contributed greatly to their progress; but the mainspring of their enormous power must be referred to their having made education—comprehensive and liberal education—one of the leading features of their institution. Hence all men of learning must be constrained to acknowledge how deeply we are in-

debted to them for the advancement of both literature and science; and some speak of their order with as much zeal as our cicerone herself. Thus the late Robert Southey remarks, in one of his letters to William Taylor of Norwich. 'Hating, as I do, popery *ex intimo corde*, I am a great admirer of the Jesuits;' and with these and other associations connected with their very remarkable history crowding upon our mind, we arrived at the church of the Dominicans, dedicated to St Paul.

Before entering this church, we were shown through a little latch door, opening into a place called 'the Calvary'—a small plot of apparently garden-ground, covered with a motley collection of the statues of patriarchs, prophets, and martyrs, all heterogeneously huddled together, like so many figures in a sculptor's yard, without any regard to proportion, arrangement, or consistency of design. Immediately before us, upon a mass of small round stones, walled up to a considerable height, was a clumsy piece of sculpture-work, exhibiting the crucifixion, with figures above, below, and around, which we abstain from describing. Underneath this unseemly pile was the most horrid part of the spectacle, which pretends to be a model taken from Jerusalem of the holy sepulchre. Upon entering a narrow opening, intended to represent a chasm in the rock, we found ourselves before an iron grating, which rails in a recess, upon the floor of which is a coffin, covered over with a white sheet, through which the hand apparently of the dead body is protruded. The walls of this cavernous-looking place were covered with figures in different attitudes, with their faces glaring with coarse red paint, to depict the tortures of the wicked in purgatory. Before this hideous scene we found kneeling against the railing a man and woman, who we might have imagined were gazing devoutly on the object before them; but as we hastily withdrew, somewhat disgusted with so profane an exhibition, they suddenly rose from their devotions, and followed us. The woman, dropping her rosary of huge black beads, held out her hand for charity; while the man, hobbling after her—for he was lame—begged with all the loquacious pertinacity of an old adept in the trade. The mendicity which is permitted within and around these Catholic churches always appears to us to be a reproach upon the authorities, encouraging and sanctioning as it does not only the vice of idleness, but the still deeper sin of hypocrisy. The toleration of such a practice is unaccountable, unless it be regarded as a remnant of that old system under which the opportunity of being charitable was as much imposed upon individuals piously inclined, as the doctrinal virtue of charity itself. Hence, in former ages, many of the pious monarchs of France were proud to see a retinue of beggars following at their heels when they walked abroad; and, as an evidence of still deeper humility, admitted them to feast at the royal table. Washing the feet of the poor, in imitation of our Saviour, was another ostentatious ceremony performed by sovereigns, for the purpose of showing their subjects an example of Christian humility. But we learn from the chronicles of these times how greatly all this mistaken zeal was abused, and that the encouragement so awarded to mendicity led to all sorts of petty larceny and crime. The distribution of the royal bounty on Maunday-Thursday in England, is the last vestige we retain of these Catholic customs; for, as population has increased, and people have become enlightened, it is found that the exigencies of society provide employment as a common duty of life for the humblest individuals; so that indiscriminate charity, however well-intended, instead of covering, too frequently gives rise now-a-days to, a multitude of sins. However, there are yet on the continent infirm and aged persons who, with the consent of their priests, look for no other support excepting the chance donations they may obtain at the doors of these churches; and doubtless such charities are frequently given in the very same spirit which in former ages enriched the shrines and altars, and augmented to so enormous an extent, the revenues of the church. The vesper service was already concluded when we entered St Paul's; and as it was, for the season of the year, a precocious summer evening, we drove around the town and the ramparts, and along the banks of the Scheldt. When we associated the scene which now came under our review with the past history of the Netherlands, how wonderful appeared the contrast! The broad and navigable river Scheldt was still flowing on as rapidly and unchanged as when thousands of vessels lay floating round the city, which now presented to us the solitary aspect of only three merchant vessels anchored off its port.

The academy of the Fine Arts is one of the principal attractions of Antwerp. Its exhibition is in a gallery of small extent in the museum—a plain-looking building, which occupies the site of an ancient convent, and is enclosed in a small garden. Here, as might be anticipated, we find many of the finest specimens of the Flemish school, including several Vandykes, and twelve of Rubens's most famous compositions. The most remarkable picture in this, or perhaps in any gallery in Europe, is Rubens's *chef d'œuvre*—the crucifixion of our Saviour between the two thieves. It is a startling, a wonderful production. The time chosen by the artist for the representation of this awful and affecting scene is the evening of that melancholy day. The three crosses are arranged somewhat in perspective, the middle one being that upon which, meek and composed, hangs the body of our Saviour, whose head is dropped upon his chest, as if he had just yielded up the ghost. Immediately before, and a little to the right of this—the centre of all interest—are two soldiers on horseback, one leaning with his elbow on his saddle-bow, looking up with earnestness at the suffering Redeemer, while the other is in the act of piercing his side with a wooden steel-pointed spear, which looks visibly bending under the weight of the thrust. To the left, next to the Saviour, is the cross upon which suffers the unbelieving malefactor; and this is a truly horrific representation of physical agony. The unhappy wretch appears to have torn one foot from the nail that fastened it, and his body is seen writhing up in convulsions against the fatal tree, while the cruel soldier, to increase his torment, is breaking his limbs with a bar of iron. Every muscle is corrugated and bulging out into a state of the most dreadful spasm and contraction. Contrasting with this, on the opposite cross to the right, is the penitent thief, looking up towards the Saviour with an expression of resignation, as if imploring forgiveness. In the foreground, the effect of the whole scene is heightened by the group of mourners, whose sufferings appear to be concentrated upon the one object of sympathy and adoration. The disciple John, hiding his face in his mantle, leans as if weeping on the shoulder of Mary, the wife of Cleophas; while the virgin mother looks upwards to her crucified Lord with eyes red with weeping. Behind these figures, at the foot of the cross, the Magdalen is seen as if starting forwards with a countenance of horror, stretching out her hand as if to implore the mercy of the horseman with his spear.* Sir Joshua Reynolds declares this profile to be the finest he ever saw by Rubens or any other painter. The effect of this picture is, in the first instance, terrible. The spectator cannot look upon it at first without a shudder; but as he examines and begins to study its details, he becomes rivetted to the spot. In the adjoining division of the gallery is the famous altar-piece by Quentin Matsys, representing the Virgin and the disciples assembled to receive the Saviour after the descent from the cross. The colouring is exceedingly fine; but the leaden, cadaverous complexion of the body, and the lifelike gash in the side, produce, to our apprehension, a very unpleasant and painful effect. Indeed in this

* This group is taken from the account given by St John—chapter xix. verse 26—of the attendants which stood by the cross.

collection, as well as in many other galleries, not excepting the Louvre, many pictures are exhibited on sacred subjects the designs of which are peculiarly offensive. It is not right that the sublime mystery of the incarnation should be reduced to the delineation of a common earthly tragedy, nor that the divine character of our Saviour should be impersonated in the most ordinary forms of suffering humanity. The visitor on the continent has too often reason to turn away, tired at the sameness, and shocked at the extravagance, of these very disagreeable representations.

'A journey to Antwerp,' says Emerson Tennant, 'is a pilgrimage to the shrine of Rubens.' It is so: and here, in the very beautiful church of Saint Jacques, immediately behind the high altar, is the small chapel which formerly belonged to his family, and which is now their consecrated mausoleum. On the 30th May 1640, Peter Paul Rubens died, and the obsequies which attended his remains to this their last resting-place were performed with the most imposing solemnity. The surrounding walls and aisles were hung with black cloth, and the clergy belonging to the church walked in advance of the funeral procession. Next came sixty orphan boys, two bearing a crown of gold, followed by others carrying lighted tapers in their hands; and then the coffin, surrounded by the more immediate relatives and friends of the deceased. The chief officers of the city, many noblemen of distinction and merchants, and all the members of the Academy of Painting, attended; and in the midst of this vast assemblage, while the requiem for the dead was being chanted, his body was lowered into the vault before us, which now contains all that may yet remain of that dust which is 'even in itself an immortality.' Nor does it sleep there alone; for on each side are deposited also the remains of the two dear companions who were the chosen partners of his life. Looking through the rails which divide this sacred spot from the aisle at the back of the choir, we behold a plain white marble altar, over which is one of his own most beautiful paintings, representing the Virgin Mary and infant Saviour, with the adoration of Saint Bonaventura. In this singularly effective picture, the colouring of which, says Sir Joshua Reynolds, 'is yet as bright as if the sun shone upon it,' he has introduced the portraits of his two wives, his father, his grandfather, and himself in the character of Saint George, in compliment to King Charles I., who conferred on him, when in England, the honour of knighthood. The life of Rubens is singularly interesting. He lived in an eventful age; and while, as a diplomatist, he enjoyed the friendship and confidence of kings and princes, as a private individual he was respected and esteemed by all classes of society. His habits were frugal; his diligence extraordinary; and nothing can inspire us with a more favourable idea of his disposition, than his conduct towards other artists. His doors were open to them at all hours, even when he was himself at the easel; and although he seldom paid visits, he was ever ready to inspect the work of any artist who wished his advice, and often would take up the brush himself to touch such parts as required it. In every picture he sought to discover something good; for it was his great delight to acknowledge the merits, and encourage upon every occasion his brother artists. He used to rise very early—in summer at four o'clock in the morning; and immediately afterwards attended mass. He then went to work, and while painting, employed a person to read to him from one of his favourite classical authors; for he was an excellent scholar, and delighted in Plutarch, Livy, Cicero, and Seneca, which, with Horace and Virgil, were his favourite authors. An hour before dinner he devoted to recreation, which consisted chiefly in conversing with visitors, who, being aware of his habits, knew at what hour their company would be agreeable to him. He indulged sparingly in the pleasures of the table, and drank but little wine. After working again until the evening, he usually rode out for an hour or two. He was extremely fond of horses, and his stables generally contained some of remarkable beauty. On his return home, it was his custom to receive a few friends, principally men of learning, or artists, with whom he shared his frugal supper meal, and passed the evening in instructive and cheerful conversation.* Such were the domestic habits of this illustrious artist, the details of whose life cannot be perused without conveying a lively conviction of the truth of the observation, that when industry is allied with genius, men may command success, and often attain the highest honours of the state.

THEORIES OF THE FORMATION OF COAL.

It is a custom of the Geological Society for the president annually to deliver an address, containing a summary of the progress of the science for the preceding year. The last address of this kind, delivered in February 1846 by Mr Leonard Horner, has been published in the *Quarterly Journal of the Geological Society*. We find in it a highly intelligent view of one of the obscurest departments of geology—the formation of coal. 'It is scarcely possible,' says Mr Horner, 'to visit a coal-field, or to read the description of one, without being led to theorise on its mode of formation. The origin of coal has long been a subject of great difficulty; nor has any theory been yet advanced with which it has been possible to reconcile all the appearances which the coal-measures exhibit, all the variety of forms in which coal is found. Indeed the more closely we examine the phenomena, the more do we feel the distance we are from a satisfactory explanation of them. According to some geologists, coal-seams and their accompanying strata are accumulations of land-plants and stony detritus, carried down by rivers into estuaries, and deposited in the sea, where the vegetable matter undergoes changes that convert it into coal. Others are of opinion that coal is the altered residuum of trees and smaller plants, that have grown on the spot where we now find them; that the forests were submerged and covered by detrital matter, which was upraised to form a foundation and a soil for another forest, to be in its turn submerged and converted into coal, and that thus the alternations which the vertical section of a coal-field exhibits are to be accounted for.

'In the geological works of the last year, we find the former theory maintained by Sir R. Murchison as most generally applicable; Mr Lyell is more inclined to adopt the latter. Sir R. Murchison dwells upon the facts of the alternations of coal with limestones containing marine remains, which are so frequently met with in most countries where coal-fields prevail; and as a striking instance of this, he refers to the Donetz coal-field. A remarkable example of a similar kind, occurring in Maryland, is mentioned by Mr Lyell. At Frostburg a black shale, ten or twelve feet thick, full of marine shells, rests on a seam of coal about three feet thick, and 300 feet below the principal seam of coal in that place. The shells are referable to no less than seventeen species, and some of them are identical with, and almost all the rest have a near affinity to, species found in the Glasgow and other coal-measures.

'The theory which refers the coal to trees and plants which have grown on the spot where it now rests, is illustrated by Mr Lyell by observations he made in Nova Scotia, on the south shore of the Bay of Fundy, at a place called "The Joggins." He states that there is a range of perpendicular cliffs, composed of regular coal-measures, inclined at an angle between twenty-four and thirty degrees, whose united thickness is between four and five miles. About nineteen seams of coal occur in the series, and they vary from two inches to four feet in thickness. The beds are quite undisturbed, save that they have been bodily moved from the horizontal position in which they must have been deposited

* See Rubens's Life, by Waagen. Edited by Mrs Jameson. London: 1840.

to that inclination they now have. In these coal-beds, at more than ten distinct levels, are stems of trees, in positions at right angles to the planes of stratification; that is, which must have stood upright when the coal-measures were horizontal. No part of the original plant is preserved except the bark, which forms a coating of bituminous coal, the interior being a solid cylinder of sand and clay, without traces of organic structure, as is usually the case with Sigillaria, and like the upright trees in the coal-measures cut through by the Bolton railway. The trees, or rather the remains of stems of trees broken off at different heights above the root, vary in height from six to twenty-five feet, and in diameter from fourteen inches to four feet. There are no appearances of roots, but some of the trees enlarge at the bottom. They rest upon, and appear to have grown in, the mass which now constitutes the coal-seams and under-lying shale, never intersecting a superior layer of coal, and never terminating downwards out of the coal or shale from which the stem rises. The underclay or shale often contains Stigmariæ. Here, then, he states, are the remains of more than ten forests, which grew the one over the other, but at distant intervals, during which each, from the lowest upwards, was successively covered by layers, of great thickness, of clays and solid stone, the materials of which must have been arranged and consolidated under the surface of water, and the vegetation of every layer in which the upright trees are fixed must have grown on land.

'The formation of coal-measures like the above, and of all others where there is evidence that the vegetable matter was not drifted to the place it now occupies, but must have grown on the spot, is then accounted for by supposing that the land sank below the level of adjoining water; that gravel, sand, and mud were washed down from the land that did not sink, and formed layers of clay and sandstone over the submerged forest, either in sufficient quantity to rise to the surface of the water, and form land for the next forest, which was submerged in its turn, or that a contrary internal movement took place, which again raised the submerged land; and that for every seam of coal, one above the other, a similar series of changes must have taken place. It is to this oscillatory movement that Mr Lyell ascribes the formation of the above remarkable phenomena in the Bay of Fundy, and others of a like nature.

'At first sight, both theories seem well-founded, when applied to the particular coal-fields described; and it is possible that these eminent and experienced geologists may be of opinion that both are true, as applied to different situations. But I see great difficulties to the full acceptance of either in many of the phenomena which, on a close examination, we find coal-fields generally present.' Mr Horner then refers to several recently-published sections of coal-fields. One in South Wales presents *eighty-four* seams of coal from one inch to nine feet thick, alternating with 340 beds of sandstone, slate, and clay. In this case, the group of coal-bearing strata is a mile in thickness. A coal-field in Nova Scotia is of twice this thickness, and contains *seventy-six* coal-seams. Mixed with the latter are a few limestones containing bivalve shells. The learned president then proceeds—

'Throughout the whole 7000 feet in the South Wales section, and if the limestones are, as is most probable, of fresh-water origin, also throughout the 14,570 feet in the Nova Scotia section, there appears to be no trace of any substance of a *marine* character; and from anything exhibited in the composition of the beds, all might have been deposited in fresh water. It seems infinitely improbable, had the deposition taken place in a sea, that *a series of accumulations of this description, implying, be it observed, a vast duration of time, with different depths and different qualities of sea-bottoms, should have taken place without a trace being discoverable, either upon the surface of the submerged layers of vegetable matter, or in any part of the clays and sandstones that lie upon them, of a marine animal or plant.* It seems no less improbable that, in a sea-skirting shore, there should be such an absence of agitation throughout so vast a space of time, as to allow a tranquil deposit of layers of fine detritus over a wide area, a spreading-out of the leaves of delicate plants in layers of clay and sand like the specimens in a herbarium, and a gradual and insensible passage, in many instances, from one bed into another. Great as the North American lakes are, I am not prepared to say that grave objections may not be urged against the probable existence of such vast bodies of fresh water as would be of sufficient extent and depth to receive the beds of many coal-fields; but the absence of marine remains throughout vast depths of strata in coal-fields is a remarkable fact, well deserving of the most careful investigation.

'That the terrestrial vegetable matter from which coal has been formed has in very many instances been deposited in the sea, is unquestionable, from their alternations with limestones containing marine remains. Such deposits and alternations in an estuary at the mouth of a great river are conceivable, but whether such enormous beds of limestone, with the corals and mollusca which they contain, could be formed in an estuary, may admit of doubt. But it is not so easy to conceive *the very distinct separation of the coal and the stony matter, if formed of drifted materials brought into the bay by a river.* It has been said that the vegetable matter is brought down at intervals, in freshets, in masses matted together, like the rafts in the Mississippi. But there could not be masses of matted vegetable matter of uniform thickness 14,000 square miles in extent, like the Brownsville bed on the Ohio; and freshets bring down gravel, and sand, and mud, as well as plants and trees. They must occur several times a-year in every river; but many years must have elapsed during the gradual deposit of the sandstones and shales that separate the seams of coal. Humboldt tells us (Kosmos, p. 295) that in the forest lands of the temperate zone, the carbon contained in the trees on a given surface would not, on an average of a hundred years, form a layer over that surface more than seven lines in thickness. If this be a well-ascertained fact, what an enormous accumulation of vegetable matter must be required to form a coal-seam of even moderate dimensions! It is extremely improbable that the vegetable matter brought down by rivers *could fall to the bottom of the sea in clear unmixed layers*; it would form a confused mass with stones, sand, and mud. Again, how difficult to conceive, how extremely improbable in such circumstances, is the preservation of delicate plants, spread out with the most perfect arrangement of their parts, uninjured by the rude action of rapid streams and currents carrying gravel and sand, and branches and trunks of trees!

'In the theory which accounts for the formation of beds of coal by supposing that they are the remains of trees and other plants that grew on the spot where the coal now exists, that the land was submerged to admit of the covering of sandstones or shale being deposited, and again elevated so that the sandstone or shale might become the subsoil of a new growth, to be again submerged, and this process repeated as often as there are seams of coal in the series—*these are demands on our assent of a most startling kind.* In the sections above examined, we have eighty-four seams of coal in the one, and seventy-six in the other. In the Saarbrück coal-field there are one hundred and twenty seams, without taking into account the thinner seams, those less than a foot thick. The materials of each of these seams, however thin (and there are some not an inch thick, lying upon and covered by great depths of sandstones and shales), must, according to this theory, have grown on land, and the covering of each must have been deposited under water. There must thus have been an equal number of successive upward and downward movements, and *these so gentle, such soft heavings, as not to break the continuity or disturb the parallelism of horizontal lines spread over hundreds of square miles*; and the

movements must, moreover, have been so nicely adjusted, that they should always be downward when a layer of vegetable matter was to be covered up; and in the upward movements, the motion must always have ceased so soon as the last layers of sand or shale had reached the surface, to be immediately covered by the fresh vegetable growth; for otherwise, we should have found evidence, in the series of successive deposits, of some being furrowed, broken up, or covered with pebbles or other detrital matter of land, long exposed to the waves breaking on a shore, and to meteoric agencies. These conditions, which seem to be inseparable from the theory in question, it would be difficult to find anything analogous to in any other case of changes in the relative level of sea and land with which we are acquainted.'

We have here put into italics what appear to us the principal difficulties on both sides of this extremely curious question. The sum of the whole matter is, that there are facts pretty clearly pointing to the processes involved in both theories, while there are other facts as clearly forbidding either process to be assumed as the sole mode of the production of coal. All must agree with Mr Horner that the whole subject of the theory of coal—whether we consider its mode of deposition, the plants out of which it has been formed, or the various changes which the vegetable matter has undergone to convert it into lignite, jet, common coal, cannel-coal, and anthracite, two or more of these varieties often occurring in the same coal-field—is extremely obscure, and presents a wide and interesting field for future investigation.

FIVE MINUTES' ADVICE TO LABOURERS AND SMALL FARMERS.

[We find the following in a cutting from an old newspaper, and regret being unable to say who is the author.]

Consider well the importance of habits of frugality, and the necessity of making provision for old age, when, from infirmity and inability to continue daily labour, privation and suffering will surely overtake the improvident. The effects of want in the period of old age, sickness, and infirmity, may generally be averted by industry, forethought, and frugality in the season of youth, health, and strength.

To some persons, the saving of anything may perhaps seem impracticable, but most people know that in this respect more depends upon their own care than upon the amount of earnings; whilst many, who have both the means and the disposition to save, have not acquired the habit of saving, simply because they never made the trial. Let them only make a beginning, and try how many sixpences and shillings can be saved in one year, and the difficulty will vanish; and trust not the savings hardly gained by your labour in the hands of private individuals, nor even in your own keeping. With the former, it may be lost by misfortune, fraud, or extravagance; in the latter, it may be pilfered, or you may be tempted to use a part of it in the hope of again replacing it.

Lodge your savings securely in the savings' bank, and be not tempted, by offers of high interest or great profits, to run risks which may bring you to destitution in your old age. Where is the man who, if in employment, cannot, between the age of eighteen and thirty, save sixpence a-week? and who has ever made the trial in vain, if he set about it earnestly? However backward people may have been to commence saving, and however positive at first that nothing can be saved, there has yet, we believe, been hardly any instance in which the commencement of saving has been entered on, that the person has not gone on adding to the fund, and making increased economical exertions; and such, we are satisfied, will be the case in every instance, if persons will only make the first effort.

Here we might stop, were it not that we feel called upon to say something upon the important subject of the education and training of your children, on rightly conducting which will depend not only their welfare here, but their happiness hereafter.

Commence early with your instruction. A mother is capable of teaching her child obedience, humility, cleanliness, and propriety, whilst it is yet almost an infant; and it is delightful to think that the first instructions can thus be communicated by so tender and natural a teacher. Remember that it is by combining affectionate tenderness with firmness in refusing what is improper, that you secure your children's happiness; and if they are early trained to be docile and obedient, the future task will be comparatively easy.

Education must, however, be always regarded but as the means to an end; for all acquirements are useless, unless they make us better in our relations as parents, children, husbands, wives, and unless they lead us to the practice of that divine precept of our religion, 'Thou shalt love thy neighbour as thyself.'

Let us suppose, then, that you have secured the benefits of a good education for your children—that they have attended an infant, and afterwards an adult school—that they have been advanced in the different branches of instruction, as far as is necessary for the pursuits in life to which they are destined—still, are you not called upon as parents to take care of their moral training? Is not something yet required of those to whom an offspring has been given? Is there not danger, even after the best precepts have been imparted, that your children may risk being corrupted by your own example?

If you suppose that your vices can be hidden from your children, you are greatly mistaken; for the quickness of perception in children enables them immediately to see through such deception. If, with the words 'Thou shalt not steal' in your mouth, you nevertheless overreach, or make use of anything not your own, or take undue advantage of others, you are practically teaching your children to be dishonest. Can you expect them to have a horror of drunkenness if they ever see you drunk, or if tippling is talked of by you as an object of gratification? If you encourage your child by promises to confess a fault, and afterwards punish him for it, do you not practically discourage his telling the truth? Or if you hold that nothing is to be told that can injure your own interests, and say 'Remember not to tell,' or 'You must not say so and so,' can you expect that your child will not lie whenever it suits his own purpose? If you are passionate and intemperate in your language, overbearing or insolent, will not your children be infected by your example? And are you not crushing in the bud the truly Christian qualities of gentleness, forbearance, and charity?

It has been well said that 'drunkenness expels reason, distempers the body, inflames the blood, impairs the memory, is a thief to the purse, a beggar's companion, a wife's wo, and children's sorrow.' You must abstain from this vice altogether if you wish to train your children up to a proper fulfilment of their duties here, and to secure their eternal happiness hereafter.

There is yet one other subject so closely interwoven with your worldly welfare, that, before concluding, we might slightly touch upon—we mean marriage. The necessity of consideration before engaging in so important a contract as that of marriage, is self-evident; and yet how many hasten to become united for life without at all considering the consequence!

In declaring marriage honourable, it is most certain that Scripture does not countenance the wickedness and folly of entailing strife, sorrow, sickness, and distress upon ourselves and our offspring—on the contrary, it supposes the married state to be one of purity, affection, and increased happiness in all the relations of life.

How common is it to see two individuals marry, and bring beings into the world, without the slightest provision for their support, and whose subsistence, from the very commencement of their union, depends wholly on resources which sickness and a thousand accidents may in an instant destroy! Such persons may shelter themselves under the plea of trusting to Providence; but Providence has given us reason for the regulation of our conduct; and to neglect the admonitions of reason, is to set Providence at defiance. And will the Deity then work a miracle in our favour, to reward us for our folly? Is it a proper reliance on Providence to descend to the level of irrational beings, and cast our offspring upon the world with as little consideration about their future wellbeing as the ostrich shows when she drops her egg into the sand, and leaves it to be hatched by the sun? It is very certain that he who becomes a father without any prospect of keeping his children from the miseries of want and beggary, is guilty of a grievous sin and misdemeanour.

THE PHILOSOPHY OF A LITTLE CARPET-BAG.

Among the most common of street sights, is that of a gentleman hurrying along towards railway or river, bearing with him a little carpet-bag. So common it is, that it fails to attract the slightest attention. A little carpet-bag is no more noted than an umbrella or walking-stick in a man's hand; and yet, when rightly viewed, it is, to our thinking, an object of no ordinary interest. We feel no envy for the man on whom has devolved the charge of a heap of luggage. The anxiety attending such property outweighs the pleasure of its possession. But a man with a little carpet-bag is one in ten thousand. He is perhaps the most perfect type of independence extant. He can snap his fingers in the face of Highland porter extortionate. No trotting urchin is idle enough to solicit the carrying of so slight a burden. While other passengers, by coach or railway, are looking after their trunks and trappings, he enters, and has the best seat. He and his 'little all' never part company. On arriving at their destination, they are off with the jaunty swagger of unencumbered bachelorhood! In contemplating a gentleman with a carpet-bag, we are struck, to a certain extent, with an idea of disproportion; but the balance is all on the easy side. There is far too little to constitute a burden, and yet there is enough to indicate wants attended to, and comforts supplied. No man with a little carpet-bag in hand has his last shirt on his back. Neither is it probable that his beard can suffer from slovenly overgrowth. When he retires to rest at night, the presumption is, that it will be in the midst of comfortable and cozy night-gear. A little carpet-bag is almost always indicative of a short and pleasurable excursion. No painful ideas of stormy seas or dreadful accidents on far-off railway lines are suggested by it. Distance is sometimes poetically measured by 'a small bird's flutter,' or 'two smokes of a pipe,' or some such shadowy, though not altogether indefinite phrase. Why may not time, in like manner, be measured by two shirts? A gentleman with a little carpet-bag may be said to contemplate about a couple of shirts' absence from home.—*Glasgow Citizen.*

THE WILD HORSE OF TEXAS.

We rode through beds of sunflowers miles in extent, their dark seedy centres and radiating yellow leaves following the sun through the day from east to west, and drooping when the shadows fell over them.—These were sometimes beautifully varied with a delicate flower of an azure tint, yielding no perfume, but forming a pleasant contrast to the bright yellow of the sunflower. About half past ten we discerned a creature in motion at an immense distance, and instantly started in pursuit. Fifteen minutes' riding brought us near enough to discover, by its fleetness, that it could not be a buffalo; yet it was too large for an antelope or a deer. On we went, and soon distinguished the erect head, the flowing mane, and the beautiful proportions of the wild horse of the prairie. He saw us, and sped away with an arrow-fleetness till he gained a distant eminence, when he turned to gaze at us, and suffered us to approach within four hundred yards, when he bounded away again in another direction with a graceful velocity delightful to behold.—We paused, for to pursue him with a view to capture was clearly out of the question. When he discovered we were not following him, he also paused, and now seemed to be inspired with curiosity equal to our own; for, after making a slight turn, he came nearer, until we could distinguish the inquiring expression of his clear bright eye, and the quick curl of his inflated nostrils. We had no hopes of catching, and did not wish to kill him; but our curiosity led us to approach him slowly. We had not advanced far, before he moved away, and, circling round, approached on the other side. He was a beautiful animal, a sorrel, with jet-black mane and tail. As he moved, we could see the muscles quiver in his glossy limbs; and when, half playfully, and half in fright, he tossed his flowing mane in the air, and flourished his long silky tail, our admiration knew no bounds, and we longed—hopelessly, vexatiously longed—to possess him. We might have shot him where we stood; but had we been starving, we could scarcely have done it. He was free, and we loved him for the very possession of that liberty we longed to take from him; but we would not kill him. We fired a rifle over his head. He heard the shot and the whiz of the ball, and away he went, disappearing in the next hollow, showing himself again as he crossed the distant ridges, still seeming smaller, until he faded away to a speck on the far horizon's verge.—*Kennedy's Texas.*

THE WATER-LILY.

Burthened with a cureless sorrow,
Came I to the river deep;
Weary, hopeless of the morrow,
Seeking but a place to weep;
Sparkling onwards, full of gladness,
Each sun-crested wavelet flew,
Mocking my deep-hearted sadness,
Till I sickened at the view.
Then I left the sunshine golden
For the gloomy willow-shade,
Desolate and unbeholden,
There my fainting limbs I laid.
And I saw a water-lily
Resting in its trembling bed,
On the drifting waters chilly,
With its petals white outspread.
Pillowed there, it lay securely,
Moving with the moving wave,
Up to heaven gazing purely,
From the river's gloomy grave.
As I looked, a burst of glory
Fell upon the snowy flower,
And the lessoned allegory
Learned I in that blessed hour:—
Thus does Faith, divine, indwelling,
Bear the soul o'er life's cold stream,
Though the gloomy billows swelling,
Evermore still darker seem.
Yet the treasure never sinketh,
Though the waves around it roll,
And the moisture that it drinketh,
Nurtures, purifies the soul.
Thus aye looking up to Heaven
Should the white and calm soul be,
Gladden in the sunshine given,
Nor from clouds shrink fearfully.
So I turned, my weak heart strengthened,
Patiently to bear my wo;
Praying, as the sorrow lengthened,
My endurance too might grow.
And my earnest heart's beseeching
Charmed away the sense of pain;
So the lily's silent teaching
Was not given to me in vain.

D. M. M.

THE NORMAN CONQUEST.

It is a popular error, as all inquirers know, to characterise the Norman Conquest as a French conquest. The Normans were not French, but a colony settled in that part of France which, as the colonists were north people, originating in Scandinavia, was called by them Normandy, having previously been designated Neustria. In fact, the Normans were cognate in their derivation to the Anglo-Saxons, and under Rollo, a piratical Dane, overran a portion of France, and forced the French monarch, Charles III., to cede Neustria to them. This took place only one hundred and fifty years previous to the invasion of England by William; so that when the Normans came here, they were not without some affinity to the Saxons whom they attacked.—*Mackinnon's History of Civilisation.*

GRADUAL RISE OF NEWFOUNDLAND ABOVE THE SEA.

It is a fact worthy of notice, that the whole of the land in and about the neighbourhood of Conception Bay, very probably the whole island, is rising out of the ocean at a rate which promises, at no very distant day, materially to affect, if not to render useless, many of the best harbours we have now on the coast. At Port-de-Grave a series of observations have been made, which undeniably prove the rapid displacement of the sea-level in the vicinity. Several large flat rocks, over which schooners might pass some thirty or forty years ago with the greatest facility, are now approaching the surface, the water being scarcely navigable for a skiff. At a place called the Cosh, at the head of Bay Roberts, upwards of a mile from the sea-shore, and at several feet above its level, covered with five or six feet of vegetable mould, there is a perfect beach, the stones being rounded, of a moderate size, and in all respects similar to those now found in the adjacent land-washes.—*Newfoundland Times.*

No. 134. New Series. SATURDAY, JULY 25, 1846. Price 1½d.

THE PROBABLE.

It has now become a trite remark, that truth often brings before us 'things stranger than fiction.' The reason is, that when a man writes fiction, he has to keep near a particular level of general probability, based on an average of occurrences and situations such as we arrive at in the course of our experience in actual life. The reader holds him as under an engagement to give things at about this average; if he goes much above it, he is condemned as resorting to a silly expedient, in order to work out an effect, or escape from a difficulty. Thus, for example, when he brings home a rich uncle from India exactly in time to save a virtuous family from ruin, he is thought to be merely resorting to a trick of his trade; and yet we know that rich uncles do come home occasionally from India, and may well find things at sixes and sevens among their friends. One or two such events in the course of his three volumes may be allowed the moralist; but if he indulges much more frequently in out-of-the-way occurrences that serve his general design, he is thought a decidedly clumsy artist. Yet nothing can be more certain than that, in actual life, series of events do occur, all of which are greatly beyond that medium-line which constitutes our ideal of the probable. As an example, a man will at once be overtaken by insolvency, by illness, by the losses of children, by a burning of his house, and all this in an abrupt or sudden manner, after many years of quiet, comfortable existence, unmarked by any such incidents. Or a considerable number of relations will die in the course of four or five years, and open a succession to wealth and title to an individual who originally had no expectation of it. There are, indeed, some conjunctures in actual life of so singular a nature, as to mock the highest flights of the human imagination.

I speak of those events as singular against the occurrence of which there is a great number of chances. For example, we are told in Brand's *History of Newcastle*, that a gentleman of that city, in the middle of the seventeenth century, dropped a ring from his hand over the bridge into the river Tyne. Years passed on; he had lost all hopes of recovering the ring, when one day his wife bought a fish in the market, and in the stomach of that fish was the identical jewel which had been lost! From the pains taken to commemorate this event, it would appear to be true; it was merely an occurrence possible, but extremely unlikely, to have occurred. A similar incident was lately recorded, with all the appearance of seriousness, in a popular miscellany. 'Many years ago a lady sent her servant—a young man about twenty years of age, and a native of that part of the country where his mistress resided—to the neighbouring town with a ring, which required some alteration, to be delivered into the hands of a jeweller. The young man went the shortest way, across the fields; and coming to a little wooden bridge that crossed a small stream, he leant against the rail, and took the ring out of its case to look at it. While doing so, it slipped out of his hand, and fell into the water. In vain he searched for it, even till it grew dark. He thought it fell into the hollow of a stump of a tree under water, but he could not find it. The time taken in the search was so long, that he feared to return and tell his story, thinking it incredible, and that he should even be suspected of having gone into evil company, and gamed it away, or sold it. In this fear he determined never to return—left wages and clothes, and fairly ran away. This seemingly great misfortune was the making of him. His intermediate history I know not; but this, that after many years' absence, either in the East or West Indies, he returned with a very considerable fortune. He now wished to clear himself with his old mistress; ascertained that she was living; purchased a diamond ring of a considerable value, which he determined to present in person, and clear his character, by telling his tale, which the credit of his present position might testify. He took the coach to the town of ——, and from thence set out to walk the distance of a few miles. He found, I should tell you, on alighting, a gentleman who resided in the neighbourhood, who was bound for the adjacent village. They walked together, and in conversation, this former servant, now a gentleman, with graceful manners and agreeable address, communicated the circumstance that made him leave the country abruptly many years before. As he was telling this, they came to the very wooden bridge. "There," said he; "it was just here that I dropped the ring; and there is the very bit of old tree into a hole of which it fell—just there." At the same time he put down the point of his umbrella into the hole of a knot in the tree, and drawing it up, to the astonishment of both, found the very ring on the ferrule of the umbrella.'* Here also was an occurrence against which, one would have previously said, the chances were as one to infinity. It was one of those things which we see to be most unlikely, yet must acknowledge to be possible, and, when well-authenticated, to be true.

There is a class of double occurrences, or coincidences, which serve to illustrate the same principle. How often will we hear a name or a fact mentioned, which we had previously never once heard of, and yet that name or fact will once more come under our notice, from a totally different quarter, ere two days, or even one, have passed! For example, not a week before the penning of these remarks, a gentleman alluded, in conversation with me, to a Russian plant which is supposed to be of a partly animal nature, and to be in a kind of animal form, with

* Blackwood's Magazine.

which it chanced that I was unacquainted. Two hours after, consulting the Penny Cyclopædia on the subject of the barometer, my eye lighted on the next ensuing article—'BAROMETZ, a singular vegetable production, of which, under the name of the Scythian lamb, many fabulous stories are told. . . It is, in reality, nothing but the prostrate hairy stem of a fern called *Aspidium Barometz*, which, from its procumbent position and shaggy appearance, looks something like a crouching animal, &c.' Or two persons, associated in our minds, but widely apart in life, will, by letter or visit, cast up in the same day. For example, I have received in one evening letters introducing strangers from two cousins living in different countries, and from neither of whom I had previously received any communication for several years, except a single letter of introduction from *one* of the parties about three months previously. One day, proceeding to a place of business where I have duties to attend to, I passed a gentleman whom I recollected having met at a country-house ten years previously, but had not seen since. We formed two out of three guests entertained by a family consisting of three persons, all of them considerably advanced in life. I was aware that two of our entertainers were since dead. With a mind full of the recollections which this gentleman's face excited, I entered the office, and there sat, waiting for me, to consult about a small matter of business, a lady, the survivor of the family of our host, and whom also I had not seen since the dinner-party. On interrogation, I found that she had come there that day, without the least knowledge of the proceedings or whereabouts of the gentleman whom I had just seen in the street. Like myself, she had never once seen him since the day when we had all met ten years ago.

The following is a still more striking instance. In the early part of October 1844, I was taking an excursion with a friend in Northumberland. Stopping for an hour at Morpeth, to refresh our horse, we asked for a newspaper to while away the time; but were told that the papers of that day had not yet arrived. I therefore resorted for amusement to a miniature copy of Crabbe's *Borough*, which I had put into my pocket for this purpose, selecting it from many books purely on account of its conveniently small size. The section of the poem on which my attention became engaged, was that in which occurs a striking description of the alarm occasioned to a pic-nic party when, in the midst of their enjoyments on a low sandy islet, usually covered at high water, they were informed that their boat had, by negligence, been allowed to float away, leaving them a prey to the rising tide, unless they should be rescued by a passing vessel, which was not likely. The most forcible part of the description of the forlorn party, is that in which the behaviour of various persons is put into contrast:—

> 'Had one been there, with spirit strong and high,
> Who could observe, as he prepared to die,
> He might have seen of hearts the varying kind,
> And traced the movement of each different mind:
> He might have seen that not the gentle maid
> Was more than stern and haughty man afraid;
> Such, calmly grieving, will their fears suppress,
> And silent prayers to mercy's throne address;
> While fiercer minds, impatient, angry, loud,
> Force their vain grief on the reluctant crowd.'—&c.

Immediately after I had read this passage, the waiter put the *Sun* of the preceding evening into my hands. It contained an extract from an Edinburgh paper, giving an account of an accident which had happened a few days before to the Windsor Castle steamer, on her passage from Dundee to Leith with a large pleasure party, which had been witnessing the departure of the queen from the former port, after her short residence at Blair-Athole. The vessel had been allowed to strike on the Carr rock, when instantly music and dancing were exchanged for alarm and terror, as the almost immediate sinking of the vessel was anticipated. Strange to say, the description of the behaviour of the passengers was an exact reflection of that in Crabbe's poem, as if the writer had been reading that composition a short while before, and had copied it; or else the poem was so true to nature, that an actual occurrence unavoidably resembled it. The identity was perfect, even to the particular of gentle women maintaining a quiet and resigned demeanour, while strong men were frantic with vain terror. This will clearly appear from the following passage in the report, which I had the curiosity to search out in the file of the paper in which it originally appeared:—'In a few moments, and the crowd of human beings collected on board, who had just before been radiant with gaiety and good-humour, changed into a wretched, terrified, and helpless mass, among whom every moral quality of the mind might be discerned brought out into frightful relief, from the sternest of stubborn endurance, to the lowest point of pusillanimity and despair. There was no distinction of age or sex; *men howled and ran about frantic like women; and women were there, young and beautiful, who exhibited to the full the calmness of moral heroism.*'—*Edinburgh Courant, October* 3, 1844.*

The day after, I went to attend service in St Nicholas' church, Newcastle, full of the recollection of the Covenanters entering the town after their victory over Charles I. at Newburnford, in 1640, when Alexander Henderson preached a sermon on the text, 'And the Lord said unto my lord, sit thou on my right hand, until I make thine enemies thy footstool.' Imagination could not resist bodying forth the scene of two hundred years ago—a stern puritan army, flushed with their first victory, listening grimly to an application of this sublime promise, amidst the long-withdrawing aisles of this noble old pile. So possessed in mind, it was absolutely startling to come suddenly, in the readings of the day, upon this very text—'The Lord said unto my lord,' &c. This looked like being persecuted with coincidences.

One might say that, if real life gives such striking phenomena as these, while fiction is forbidden to use them, records from actual life ought to be far more interesting, even to the readers for mere excitement, than any of the effusions of fancy. And it really does seem far from unlikely that, if the former were chronicled with fidelity, they would be apt to run romance entirely out of the market.

The wonder, after all, remains, that events, against which there are so many chances, should occur so often as they seem to do. Let us consider what probability actually is. An able philosopher of our century thus speaks of it:—'It is to the imperfection of the human mind,' he says, 'and not to any irregularity in the nature of things, that our ideas of chance and probability are to be referred. Events which to one man seem accidental and precarious, to another, who is better informed, or who has more power of generalisation, appear to be regular and certain. . . . The laws of the material world have the same infallible operation on the minute and the great bodies of the universe; and the motions of the former are as determinate as those of the latter.' He adds, that every particle of water or air has described from the beginning a *trajectory* or path determined by mechanical principles, and which is therefore *knowable*, 'and would be an object of science to a mind informed of all the original conditions, and possessing an analysis that would follow them through their various combinations. The same,' he continues, 'is true of

* On inquiry, it appears that the writer of the report had not previously read the passage in the Borough.

every atom of the material world: so that nothing but information sufficiently extensive, and a calculus sufficiently powerful, are wanting to reduce all things to a certainty. . . . Probability and chance are thus ideas relative to human ignorance. The latter means a series of events not regulated by any law that we can perceive. Not perceiving the existence of a law, we reason as if there were none, or no principle by which one state of things determines that which is to follow.'*

Unable to discover or follow the laws by which events of this nature are determined, we can nevertheless reduce them to calculation in a particular way. All are familiar with the throwing of dice. There being six sides, any one of which may be uppermost, the chance of throwing the die with a particular side, say the ace, uppermost, is one-sixth. With two dice, the chance of throwing two aces is 1-36th: as each face of the one die may be combined with any face of the other. Thus we learn that, 'when any event may fall out a certain number of ways, all of which, to our apprehension, are equally possible, the probability that the event will happen, with certain conditions accompanying it, may be expressed by a fraction, of which the numerator is the number of the instances favourable to those conditions, and the denominator the number of the possible instances.' Now observe, in a couple of dice there are but thirty-six combinations; but what would be the denominator of a fraction which should express the little likelihood of my being engaged in reading Crabbe's account of the distressed pic-nic party, at the moment when a newspaper was approaching me, containing an account of a similar occurrence, expressed almost in the same terms! One can see in a moment the possibility of such an event; but he cannot help thinking, at the same time, that thousands of lives were likely to have passed without its occurring in one of them. It seems difficult to reconcile the frequency of such coincidences, which is matter of familiar observation to all, with the idea of our philosopher, that all secular events might be reduced under fixed laws, if we only could trace the series in their mutual dependency.

Some considerations will, nevertheless, occur to bring such events into at least an approximation with our ideas respecting fixed laws. In the first place, there are what may be called extenuating circumstances. These we usually discover when we look narrowly into particulars. For example, the Scriptural text already quoted, being a portion of the 110th Psalm, had a chance of occurring in the usual readings of the Psalter equal to about one in sixty-two (the Psalms being divided into so many portions for reading during the month). Then it is repeated no fewer than five times in the New Testament. In the portions of Scripture appointed for the daily lessons throughout the year, chapters containing this passage occur no fewer than thirteen times. This obviously added very considerably to the chance that, on attending worship in St Nicholas' church for the first time, I should hear Henderson's text repeated. Thus the total likelihood was not so little as one would, on a cursory glance, imagine. It is, in the second place, to be observed that the total number of acts, movements, and occurrences of every kind in life must be much greater, even in the case of the most quiet-living people, than at first sight appears. If this truly be the case, instances of coincidence must bear a much smaller proportion to the entire mass than we are apt to suppose; that is the same thing as to say, that the frequency of their occurrence is more apparent than real. Again, amidst the multitude of the things which pass unobserved and unremembered, there may of course be many occurrences of facts and other particulars, which we believe to be new to us when they occur collisively: thus the apparent first of the two instances may be the tenth, or twentieth, or hundredth, instead of the first. All of these considerations undoubtedly tend to bring the supposed supernaturality *towards*, if not wholly *into*, naturality. If so much can be accounted for from what we know, let us add some further unknown quantity for what we do not know, and then perhaps little, if any, difficulty will remain.

* Playfair's Works, iv. 494.

LOUIS MANDRIN.

BY MRS CROWE.

It is nearly a century ago since the hero of our tale played his part in the world, and it is not the first time we have heard of him; but it is only now that a detailed account of his adventures has reached us. A painstaking German has been at the trouble of digging out these curious particulars—quite curious enough to justify our giving them to the public.

Louis Mandrin was born at St Etienne, in Dauphiné, in the year 1714. His father was a coiner of false money, and Louis was brought up to the same trade; but being fond of adventure and an active life, besides being extremely ambitious, he joined the army as soon as he became his own master, by the death of his father, who was killed by a musket-ball whilst flying before the mounted police. Brave and clever, the youth made a good soldier; but the discipline becoming irksome to him, he deserted, and gathering together as many as he could find of the old band, he resumed his former occupation. The locality he selected for the establishment of his unlawful manufactory was well calculated for the purpose. It was on the coast of St Andrè, which borders the Mediterranean Sea—a lonely and pathless region, where he was little likely to be overlooked and interfered with. The clang of the hammers which resounded from the clefts of the mountains, and the smoke that curled over their summits, were not unnoticed by the thinly-scattered inhabitants, and doubtless they were not without their suspicions of what was going on; but meddling with a desperate band of this description was too rash an enterprise to be undertaken without a powerful motive; and the coiners, by avoiding all offence to their neighbours, took care to furnish none. They worked chiefly by night, showing themselves little by day, the hours of which were mostly passed in sleep and carousals. Their coin was circulated at the fairs and markets of remote towns; and this nice office was intrusted only to the captain, who attended on these occasions under various disguises—as that of a monk marketing for his convent, a soldier for his troop, or a cattle-driver charged with commissions from his distant home. The goods he purchased were afterwards disposed of to receivers, and the profits fairly divided, the captain of course having the largest share.

Louis Mandrin was not more than twenty years of age when he placed himself at the head of his troop. They numbered about a dozen men, and he seems to have possessed the art of inspiring them with unbounded confidence and attachment, which they evinced by an inviolable fidelity and unhesitating obedience; the only instance of treachery on record amongst them being the one which led to their ultimate abandonment of their mountain home. Some circumstance, which does not appear, seems to have awakened the conscience of one of the band, who, to appease his remorse, gave information to the authorities. The police were immediately despatched to seize the coiners; but the attack was made by day, and conducted with so little prudence, that the enterprise wholly failed. Mandrin was absent; but Rocqueirol, the second lieutenant, observing the absence of the informer, suspected mischief, and caused the instant removal of all the money, stamps, and implements. The pursuers found nothing but the melting furnaces and the bellows. The troop had also escaped through paths known only to themselves, with the exception of two, who, being asleep when the others decamped, passed a somewhat unpleasant four-and-twenty hours concealed behind a stone. But even these eluded the vigilance of the officers, and got clear off. For a

short period they established themselves in the clefts of a rock at some distance from their former home; but they looked out for something better, and ere long found it.

Seated on an eminence in a deep valley, at the foot of lofty mountains, stood an old feudal castle. It was surrounded by a moat, and enclosed by a park thickly set with yew hedges and dark avenues. The walls were massive, the towers formed for defence, and it was rumoured that there were various underground vaults and secret ways connected with the building, very desirable to such tenants as Mandrin and his band. This convenient dwelling was at present in the possession of an advocate's widow. The advocate was lately dead, and the widow, with her servants, inhabited the fortress alone. Many of the apartments were consequently unoccupied; and on this circumstance the captain of the coiners founded his hopes.

His first step was to introduce himself into the castle in the disguise of a travelling merchant. Having by this means gained a tolerable notion of the interior, he proceeded with his plan. Presently the castle was haunted. From the chamber of the deceased advocate issued the most mournful sounds; tables and chairs moved about as if they were alive; the books walked off the shelves; the window-panes rattled; there were clankings of chains, and sighs, and groans; in short, all manner of extraordinary and unaccountable noises and disturbances. The terrified lady fled for refuge to the kitchen, where she found the servants trembling with affright. By and by the ghost of the advocate appeared wrapt in a winding-sheet, followed by fiends with flaming torches in their hands. It seems singular that so barefaced and clumsy an imposition should have succeeded. We must suppose that Mandrin understood the people he had to deal with, or he would not have ventured on a trick so liable to detection. Succeed he did, for the widow and all her establishment quitted the castle; whereupon Mandrin and his band stole quietly in, and took their places; nor did they, after admission, discontinue the practices which imposed on the superstitious fears of the neighbourhood. The back-door was the only one used by the inhabitants of this haunted castle, and that was very carefully guarded. The furnaces were in the cellars, and thence issued an immense quantity of false money, which, however, was never circulated in the neighbourhood. They also carried on a considerable trade in horses and tobacco with the Spanish frontier; and Louis Mandrin became a rich man.

Notwithstanding the terrors which the party of desperadoes contrived to throw around the castle, notions occasionally sprung up in the minds of the more courageous that all was but a trick. At length a young officer, quartered at Grenoble, resolved to brave every danger, and investigate the cause of the strange noises heard, and things seen, at the place. Well armed, and accompanied by a brave grenadier of his troop, he mounted his horse, and rode to the castle. They knocked at the portal; but the ghost took no notice; till at length, provoked by their perseverance, an angry bear presented his muzzle at the grate. But a well-aimed bullet laid him low, and the invaders forced the door. The scenes that are recorded to have presented themselves on their entrance cannot but awaken considerable surprise, from the extraordinary trouble and ingenuity that must have been expended in preparing for such a contingency. No one had ventured on so rash an enterprise before, and yet the drama seems to have been as well played as if it had been the twentieth performance instead of the first. We must suppose that the rehearsals had been very frequent. As the bold intruders forced door after door, strange sights met their view—frightful figures glided past them, mysterious fires gleamed in the deserted chambers, dwarfs and goblins crouched in the corners, but, when approached, became invisible, gigantic forms peered in at the windows, and large serpents and loathsome reptiles crawled over the floors. Still the young soldier was not to be repulsed. Amidst all these terrors, which continually eluded his close investigation, he undauntedly pursued his way.

They had thus wandered over a considerable portion of the building, when they heard footsteps approaching; the door of the room they were in opened, and a cavalier, bearing a drawn sword in his hand, and, from his dress, apparently a person of distinction, entered, followed by his servant. At the sight of the strangers he started back with evident surprise, and sternly demanded who they were. The officer told him his errand at once: he was there for the purpose of verifying or disproving the incredible reports that had reached him concerning the castle. Precisely the same object had occasioned the visit of the cavalier; and although he modestly confessed himself generally a stranger to fear, he could not deny that he yet trembled with horror at what had encountered him at the gate. From the bear which the officer had shot had proceeded a voice, bidding him *beware!* 'I have been once hit,' cried the voice, 'and I spared the rash adventurer; but if you dare to lift your arm against me, your life will be the instant forfeit!' The incredulous officer was about returning to the gate where he had so lately left the bear dead, to investigate this phenomenon, when, to his amazement, the creature appeared at their heels, and after giving a savage growl, vanished through a door, which immediately closed with a tremendous bang: at the same moment the serpents and reptiles disappeared, seeming to dissolve away in a cloud.

At this sight the terror of the cavalier was considerable: indeed he was quite overcome by it, although he confessed himself ashamed of his pusillanimity, and avowed his determination to pursue the adventure. The young officer tried to fortify him; but fear is infectious, and his own courage was not invigorated by the weakness of his companion: so that, as night was by this time approaching, they agreed that it was desirable to evacuate the premises. They rode together till their paths separated, and then parted with mutual esteem.

When the young soldier reached the inn, and was seated comfortably in the chimney-corner, beyond the reach of the advocate's ghost, his natural courage revived; and the more he considered what had passed, the less satisfied he felt with the result of his adventure; especially as the grenadier, who with undaunted valour had assailed one of the large serpents, produced a morsel of its skin, which bore an astonishing resemblance to a bit of coloured pasteboard. But everybody was shocked at their incredulity; and it was confidently predicted that if they ventured on a second expedition, as they proposed, they would assuredly never be heard of more. As for the pasteboard, they said that was easily accounted for—the whole thing from first to last being enchantment, and the work of the devil. And so, indeed, it appeared, when, on the following morning, the piece of pasteboard was found converted into a bit of skin! Finding himself more laughed at than thanked, and being much dissuaded by his friends, the young officer quitted Grenoble without repeating his visit to the haunted castle—a proceeding in which he had more reason to congratulate himself than he was aware of; for had he a second time rendered himself so obnoxious, the prediction of the country people would assuredly have been verified. It is not to be supposed that even the first time he would have escaped so well; but he was a gentleman, well connected, and his regiment being quartered at Grenoble, his disappearance would have undoubtedly led to very inconvenient perquisitions. So they tried what their jugglery could do; and certainly the thing seems to have been admirably managed. The cavalier was Rocqueirol, that clever rascal; the resuscitated bear was one of the troop, disguised in the real bear's skin, which they had hastily stripped off for the purpose; the serpents moved on springs; and a bit of skin was cleverly substituted for the bit of pasteboard by a spy of the band. Of course so hazardous an imposture could not have been sustained without allies in all directions.

Nevertheless, in spite of the failure of this enterprise, the universal faith was somewhat undermined, and Mandrin found it necessary to be more cautious. The imprudence of one of his people augmented the danger. Contrary to orders, this man had attended a neighbouring market, and with his false money purchased a considerable quantity of valuable merchandise. Of course such customers gave good prices—it was not worth their while to haggle about a few crowns. The deluded merchant, overjoyed at the liberal sum he was receiving, in the exhilaration of his spirits threw up one of the pieces in the air: he missed it, and it fell to the ground; and as it fell, broke into a dozen pieces. Confounded at so strange a circumstance, he repeated the experiment, and with the same result. The fleetness of his horse alone saved the defrauder from the vengeance of the populace. But immediately the rumour became rife that there were coiners in the neighbourhood, and suspicion fell upon the haunted castle. Previously to this, horses had frequently been observed feeding in the park; but the people had hitherto maintained that they were not real horses; and 'wo betide,' said they, 'any one who ventured upon their backs!' However, it was now asserted that they had been heard to neigh like steeds of flesh and blood; and if they were really horses, doubtless they had owners.

As these bold and heterodox opinions gained strength, they at length reached the ears of the widow, who had felt herself extremely aggrieved by her late husband's pertinacious adherence to this world, instead of taking his flight quietly for a better, like other respectable, well-conducted people. It was a regular fraud to leave her the castle, as he had done by his will, and then for his ghost to drive her out of it! Besides, ejected from her castle, she had small chance of getting another husband; and she was exceedingly annoyed at learning that many people opined that to be the very end and object of his haunting her.

Eager, therefore, to recover her property, and release herself from the restraints these calumnies imposed on her, she called her friends together; and after pleading her hard case, and communicating the suspicions that had lately arisen—namely, that the inmates of the castle were not altogether of so spiritual a character as had been imagined—she won so far upon their sympathy, that they promised her their assistance. An expedition was consequently resolved upon, and, as the party believed, conducted with the greatest secrecy. On an appointed day they started for the castle—a band of forty well-armed men, consisting of peasants and soldiers, headed by the lady's friends and an experienced military man.

Mandrin, however, was fully aware of their intentions, and although the notice was short, had adopted the best means attainable for defence.

Neither spectres nor bears this time impeded the entrance of the invaders. All was still as death: nothing was to be seen but empty halls and chambers. The commander of the troop concluding the inhabitants had taken refuge in the cellars, proceeded thither, after placing a guard before the doors and sentries in the park. They descended the stairs, and were preparing to storm the cellar, when they were flung into confusion by a sharp fire of musketry; to defend themselves from which they were obliged to bring down the old carpets that covered the floors, and by filling them with earth, raise a bulwark, under cover of which they might advance. The besieged maintained their defence, however, for three hours, when the silence that ensued seemed to announce that their ammunition was exhausted; whereupon the elated victors forced the entrance, and rushed triumphantly into the place. It proved to be a large vault, not less than eighty feet long, and was well lighted by torches attached to the walls; but, to their amazement, not a soul was there but themselves! It was absolutely empty. The bottom was of hard clay; the roof strongly arched; the walls of stone; and no signs of a door or opening of any sort could be found. Still, those who had lately maintained so brisk a fire could not be far off. The castle was surrounded, and watched at every point: they would surely make their exit somewhere. The besiegers laid their ears to the ground and listened, but not a leaf stirred—no sound betrayed the whereabout of the fugitives. They then returned to the cellar, assured that they must be somehow there concealed, or that an outlet must exist. There was one, but it was not without extraordinary perseverance that they found it. It was in the wall, and it always remained a mystery how, on issuing from the vault, they could have contrived so entirely to remove all traces of their exit.

This way, however, they had retreated, and had taken shelter in another vault, about fifty paces distant, which was not only deeper, but beyond the precincts of the castle. Here, weary and exhausted, they ventured to take a little repose, trusting to a glass of water and a drum, which they placed on the earth, to inform them of the approach of the assailants. The shaking of the water and the quaking of the drum soon warned them that their last refuge was discovered. Then Mandrin sprung to his feet, and gave the word for flight—each man to take care of himself the best way he could, further defence being hopeless. To gain time, he made them pluck up the palisades that sustained the walls of the passage that led from their last retreat to this. He certainly seems to have exhibited a genius for tactics worthy of a better cause.

Immediately over this vault stood an old withered oak, whose widely-spread roots, from which the earth was washed, allowed some gleams of light to penetrate below. Suddenly one of the sentries in the park, whose post was near this tree, saw a man emerge from the earth; then another, and another. Before he could give the alarm, the whole troop had made good their exit. The prime warriors were at work in the cellar; the guards, wearied with their watch, were mostly sleeping in the park; the coiners were well acquainted with the localities, and before the officer and his band could be summoned to the spot, the fugitives were all clear off, with the exception of one unlucky straggler.

When the besiegers at length reached the farthest vault, they found a quantity of implements, some provisions, and a vast heap of false money. The police afterwards succeeded in arresting two more of the band; and these three were executed at Grenoble, after making a full confession of the circumstances here related.

It was by their means that Mandrin was also taken, when on a visit to a lady to whom he had become attached. When this infatuated young person learnt to whom she had given her affections, she appears to have been overwhelmed with grief and confusion. She lay for some time insensible. As soon as she recovered her recollection, she insisted on being allowed to enter a convent; which she did on that very day, and there remained for the rest of her life.

When Mandrin found himself a prisoner, he raged like a lion in toils, till, by the violence of his efforts, he actually broke the chains that bound him; whereupon they flung him into a noisome subterranean dungeon. Here he fell ill, and the physician who attended him told the authorities that, if they did not hasten his execution, death would defraud them of their prey. The preparations were accordingly expedited; but, as was customary, some sisters of charity were permitted to attend his bed, and whilst they ministered to his body, they endeavoured to save his soul. He listened to their exhortations with humility, and declared himself not ill-disposed to repentance; but he refused to see the priest, or to join with them in prayer, because he said the cruelty with which he was treated kept his blood in a fever, and hardened his heart. The good creatures, anxious for his salvation, represented the case so earnestly, that the public interested themselves in the affair; and the issue was, that Mandrin was removed to a better prison, and treated with more humanity. Here he made a full confession of his crimes; and as

the hour for his execution approached, his piety not only edified all who came near him, but formed the theme of the whole city of Grenoble.

On the eve of the day appointed for his death, he requested, as a last favour, that he might be permitted to sup with those of his former companions in crime who were to die with him, of whom there were by this time several in the prison. This was a favour not unfrequently granted at that period. It was looked upon as a sort of religious ceremony, and the general sympathy awakened by Mandrin's repentance easily obtained it for him. The head jailer presided at the feast; and there must have been plenty of wine, for, by the time it was over, he lay under the table. This had been Mandrin's design. He immediately seized the keys, set all the prisoners free, and fled.

He was now at liberty; but he had lost all, and had to begin the world anew. He was one of those human beings whom no experience could reform, nor no fear subdue; one who might have been a hero in a good cause; and it is not impossible that, had he been the son of an honest man, and his early associations more fortunate, his career might have been very different. He was undoubtedly brave and clever; and he does not appear to have been naturally cruel, although the perverting influences of his mode of life eventually rendered him so.

Their next retreat was a hermit's cell. Its inmate they seized and kept prisoner, having forced him to instruct them how to personate him, which one of the band did when necessary. They numbered about thirty-seven, and lived here for some time in great luxury, practising their old trade with considerable success. Strict discipline was observed: the captain kept his state, and dined daily off a table of six covers. The rest of the troop ate together. But the necessity for caution rendered this mode of life too tame for Mandrin; and unable to submit to the restraint, he indulged himself with frequent expeditions abroad. When the eye of the chief was not on them, his subjects became unruly; and at length, by their imprudence, their secret was betrayed, and the troopers sent in pursuit of them. This time the enterprise was conducted by the authorities, and no precaution was neglected to insure success. The mountain was completely surrounded, and the doors of the hermitage forced; but, as in the haunted castle, neither the coiners nor any of their goods or chattels were to be seen. When it was too late, they discovered a secret outlet, which led by a subterranean way into the valley. Here they found the unfortunate hermit, half starved, as, during the bustle of the siege, they had forgotten to supply him with provisions.

The coiners took refuge in a neighbouring forest; but they were soon surrounded by troops; and after a murderous battle, in which Mandrin lost the greater part of his men, he and five of the survivors were taken, and once more found themselves in the prison of Grenoble. This time the precautions observed precluded all possibility of escape. His trial was hastily conducted, and on the earliest day possible he and his companions were led to the scaffold. The only favour he asked was, that he might not be conveyed to death in the cart used for common malefactors. This request was granted; but, to make sure of him, they not only bound his hands, but they tied his thumbs tightly together. Nevertheless, strange to say, by one violent effort he burst his bonds when on the scaffold, and knocking down the executioner, and overthrowing the confessor, who overturned the constable in his fall, Mandrin leapt amongst the astonished crowd, who unconsciously made way for him. Before the troops could pursue him, he had reached the mountains, whilst his unfortunate comrades suffered the death to which they were sentenced.

Scouts were sent after him in all directions, and large rewards offered for his apprehension: notwithstanding, but for the treachery of a friend, his ingenuity might have disappointed his pursuers. He seized a capuchin monk, robbed him of his frock and cowl, and, to mislead his enemies, set him adrift to tell the tale, whilst he assumed another disguise. But his confidant betrayed him to the troopers, who, considering the person they had to deal with, gagged and chained him; and at night put him into a cistern, which they covered with planks and stones, and guarded by two sentries.

In the morning, when they lifted the planks and stones, he was gone! The cistern adjoined a cellar: he had mined his way through, and so once more escaped.

He next made his way to Avignon, and thence to Lyons, where he enlisted as a soldier; but, spying dangers, he deserted, carrying away three other recruits with him. Shortly afterwards he fell in with some of his old band, and they established a brisk illicit trade on the frontiers of Savoy. As rogues and vagabonds are not scarce, especially on the frontiers of continental states, their numbers soon increased, till the provinces of Languedoc, Dauphiné, and Macon were so overrun with contraband goods, that the effects were sensibly felt by the excise. Their acts of cruelty also made them the terror of the surrounding country. Mandrin forced the unfortunate people to purchase his merchandise, broke into and robbed the custom-houses, and put to death, without mercy, all who offended him. His men wore the king's uniform, with scarfs and crosses of St Louis; they committed the most astonishing acts of daring, and made the most obstinate and extraordinary defences. In short, it was a regular war; and at length it came to a pitched battle betwixt the king's troops and the robbers. Outnumbered, he was forced, after hard fighting, to intrench himself in the village of Grenand; and here his adversaries determined to starve him out. Mandrin had committed a great error in making the country people his foes, and he now felt the consequences of his mistake. Unable to procure provisions, he resolved to cut his way through the enemy. He conducted the enterprise with consummate generalship: the loss was great on both sides, but he himself got away. But from this period his star declined. He was too universally feared and detested to escape the toils that were set for him: he awoke one morning to find himself betrayed, and a prisoner. He was executed with as little delay as possible, exhibiting to the last an indomitable spirit. The sensation created by his capture was immense; for, from the number of his followers, and the boldness of his enterprises, what had at first been a mere affair of the police, had ended by becoming a national concern.

We present the foregoing narrative as a striking illustration of a past state of manners in France, as well as of the extraordinary defectiveness of the law in that country under the old regime. Such a drama as that acted by Louis Mandrin can never be repeated in Europe.

SPONTANEOUS MOTION.

Few phenomena in natural science are so puzzling as that which, for the want of a more appropriate epithet, has been termed spontaneous motion. It consists in the performance of a class of movements for which we are unable to assign any cause, by bodies and organisations commonly unendowed with motion of a voluntary or mimic-voluntary character. In the present paper, I shall almost confine myself exclusively to the display of spontaneous motions afforded us in the vegetable kingdom; but it may be preliminarily mentioned, that substances completely inorganic, in certain circumstances, possess what may be called spontaneous motion. Thus a lump of camphor, when placed in water, will revolve on its axis for several hours; and if it is forcibly arrested, it will immediately, when set at liberty, recommence its revolutions. There is a salt, called an iodide of mercury by chemists, which simulates spontaneous motion. When it is newly formed, it is yellow. If it is watched beneath the microscope, it is found that each crystalline scale jumps over, and instantly changes its hue from

yellow to a vivid scarlet. Such, and similar instances, are not unfrequent: a satisfactory explanation of the cause of the motion has not been given. In the first of the instances cited, it would be curious to inquire if this, and other identical motions of inorganic particles, are due in part to the diamagnetic properties of certain bodies recently developed by Faraday.

Voluntary motion is so commonly regarded as the peculiar attribute of animals, possessed of the, as we believe it, necessary apparatus of nerves and muscles, that, in ignorance of other powers capable of producing voluntary or spontaneous motion, we are slow to admit the existence of such motion in that portion of organised creation, the vegetable world, which is furnished with no demonstrable nerves or muscles. It will be the object of the present paper to indicate a few of those instances in vegetable life which appear to point to the opposite conclusion—that motion, and even locomotion, are not confined to the narrow limits of animal organisations.

The sleep and re-opening of flowers and leaves afford a familiar and very common instance of a species of spontaneous motion in plants. The humble daisy opens with the morning's sunrise, and closes at sunset; and Macculloch remarks, 'that nothing but permanent force can keep the young daisy open when it has closed for the night.' If its petals are separated, it will again close with a species of action not unlike that of a sphincter muscle. But many flowers observe, with a precision of the most striking character, certain periodism in their opening and closing, which serves to bring out more forcibly the apparently spontaneous nature of these movements. Linnæus claims the credit of having constructed a table of their varying, and yet almost invariable motions, which he denominates 'Flora's Clock'—the first hour on which is three in the morning, and the last ten at night. Some species of the convolvuli announce the beginning of the floral day, and others — the purple — its close. Many flowers also open at stated hours of the day, but some close again long before the sun has set; and again, it is familiar to almost every one that many open at night, and are closed during the day: the night-blowing cereus is an instance. In these cases we are furnished with a most decided answer to those vegetable physiologists who would deny all spontaneity of motion to the vegetable kingdom, and assert that the opening and shutting of flowers is in every case due to the influence of the sun's light. It may be mentioned, *en passant*, to show the unworthy arguments of some who deny the possession of this attribute altogether to plants, that one experimenter constructed artificial leaves and flowers of two materials, united into one baurina, and attempted to overturn the theory here advocated, by triumphantly exhibiting the irregular contortions and motions of these toys, produced by their differing hygrometric properties. Many of the movements above-mentioned are undoubtedly effected by the influence of the sun's, and of other light; but this is no grave admission, for it remains to be shown, first, the manner in which light thus acts; and, second, the cause why such an influence is not invariable. The cereus does not expand before the light; and other flowers which do so, nevertheless close again under the full influence of the same cause. That light, as a general rule, is essential to them, no one would hesitate to admit. Decandolle performed some interesting experiments upon this question: he discovered that, by a combination of six powerful lamps, he was able to make the genus mesembryanthemum amenable to the influence of an artificial day: these plants expanded their flowers before the glare of the lamps, and closed them again when removed into darkness. The leaves of the *Mimosa pudica*—the 'sensitive plant'—droop and fold up, in common with many others, at night; and when this plant was subjected to the lamplight, it was found that its periods of sleep and awakening were first deranged, and for several days were irregular; but after this, acknowledged the new influence, and closed and folded up during the day, unfolding again at night—day and night being purposely reversed. Many plants bow their heads at night, and raise them again in the morning: thus the *Noli-me-tangere* hides its flower from the chill dews of the evening under its leaves, withdrawing the shelter again during the day. The sleep of leaves and flowers, however, does not appear to have in every instance a common cause. While, generally, both organs fold up during the night simultaneously, it is related by M. Berthelot that a plant, a species of acacia (a tribe, it may be mentioned, endowed with a larger share than usual of sensitive and spontaneous motions), cultivated in the gardens of Orotava, in the island of Teneriffe, at sunset closes its leaflets in an imbricated manner [one overlapping another], but, at the same time, its flowers expand, and the numerous stamina stand up in tufts. At sunrise, while the leaves resume their proper position, the flowers droop and hang down, the long filaments bending, and, from their glistening character, giving to the flowers the appearance of a flock of silk. In this instance the expansion of the leaves is diurnal, of the flowers nocturnal.

If some spontaneous motions of the periodical nature here described are influenced by light, others of equal singularity are considerably affected by atmospheric humidity. Thus, as a companion to 'Flora's Timepiece,' an ingenious botanist has constructed a scale of plants, which may constitute 'Flora's Weatherglass.'* By observation of these plants, the advent of rain or moist air may be pretty accurately prognosticated. A few will refuse to close at night if it is about to rain on the morrow, as if anxious to greet the friendly power; while others, of a more timid character, will not unclose their flowers in the prospect of wet. The little snowdrop safely shuts up its humble flower before the storm; but, as Macculloch observes, it is a remarkable circumstance that, if it is covered by the shelter of a bush, it makes no attempt to close, while its less fortunate companions around it are all firmly shut up. The plants whose leaves fold up at night are few in number, and are confined chiefly to the leguminosæ and oscalideæ. It is even, in these orders, more frequent to find this peculiarity existing in the leaflets than in the proper leaves of the plant. In a few instances, this motion is due simply to a hygrometric condition of the air, affecting their tissues, as it does other inanimate objects: these are exceptions to an otherwise general rule.

Spontaneous motions, to a remarkable degree, are to be discovered in plants at that which forms the highest point of vegetable vigour—the period when the functions of their flowers are about to be completed. It has been long known that the filaments of the flower of the common berberry rise up and strike the stigma with their anthers upon the slightest irritation: the

* As a pendant to these, we might add 'Flora's Prophetic Almanac;' for the Euphorbia oleœfolia hangs down its head all winter, and announces the return of spring by lifting it up again.

anthers lie in the concavity of the petals, and could never approach the stigma, were it not that the busy insect, in its search for honey, provokes the irritability of the stamina, and thus secures the impregnation of the seed. In the monk'shood, it is stated that each of the stamina is inclined to the stigma in succession, with the utmost regularity, for seven or eight days. The stamina of the golden amaryllis are constantly agitated throughout the whole period of fecundation. The genus styridium possesses a spontaneous motion of a more striking character. So long as the flower is immature, the pistil is immovable; but as soon as it is perfected, if this column is irritated by a needle, it throws itself from the one to the other side of the flower with considerable force; but in a short time it recovers its original position. These movements may be repeatedly produced by the same means. It has been prettily, and not improbably conjectured, that this remarkable irritability was intended to enable the flower to cast off any insect intruder which might attempt to insinuate itself into it. The stamina of the cactus tuna, or Indian fig, when gently scratched with a needle's point, gradually take, from the erect, a recumbent position, and crouch down together at the bottom of the flower, as if withdrawing from the injury. The filaments of the geranium bow forwards, so as to place the anthers upon the stigma.

It has been not long since related that there is a plant growing in the Swan river colony possessing yet more extraordinary powers of motion. Its flowers are of an anomalous structure, and it would seem that the anthers form the superior, and the stigma the inferior lids of a kind of box. The upper lid does not touch the under, but is connected to it by a hinge: they remain apart until some insect lights upon the flower; the lid then instantly closes over it, and keeps it prisoner so long as it is turbulent and buzzes about: when it is quite still, the lid uncloses, and suffers it to depart from its vegetable lock-up: if, however, the lid fails in capturing the trespasser, it rises again in anticipation of a new-comer. In this case the insect, by bustling about, rubs off the pollen of the anthers upon the surface of the stigma, becoming the involuntary medium of communicating the fertilising influence from the one to the other.

The spores or sporules of the confervæ, soon after their first formation, execute movements in water bearing the most vivid analogy to the ciliary motion of the embryo mussel, described in No. 128 of our present series. The pollen tubes of the asclepiadeæ pierce the walls of their enclosing cell, and succeed in reaching the stigma wheresoever it may be situated.

There is yet another class of movements, in the parts of vegetables, which surpasses all the rest in the singularity of its appearance, and in the difficulty of discovering any exciting cause for it. The sensitive plant forms one of the nearest of the approaches to animal life to be found in the vegetable kingdom, being endowed with the faculty of what may be called sensation, if the most striking evidence of feeling—retirement from injury—is to be recognised under such a head. The species commonly known as the sensitive plant is the *Mimosa pudica*. When one of its leaflets is touched, it, with its fellow, closes soon after, and both fold up: this is followed by the closure and folding up of the next pair of leaflets, and subsequently of all the leaflets on the same stalk, while the stalk itself then droops and bends down at an articulation which has the effect of a hinge. If the shock communicated to the plant is pretty sharp, the same consequences take place throughout the whole of its leaves and leaf-stalks, and it is, to speak comparatively, of a rapid character. The position then assumed is identical with that which the plant takes at night. The more healthy the plant, and the more elevated the temperature of the stove, the more active and lifelike are the motions. The plant also seems to respond to these apparent injuries more quickly in the morning, and at noon, than at a later period of the day. After a time, it re-opens its leaves, and the stalk lifts up its head, when we may again offend it, and cause a second occurrence of the movement: but this irritability is soon exhausted, and then requires a period of repose for its restoration. A curious experiment was once made with one of these plants. It was taken out in a carriage, in full vigour, but as soon as the vehicle began to move over a rough pavement, it drooped its leaves, and was affected throughout; but on the journey, it at length seemed to have accommodated itself to the motion, and resumed all its former appearance; a fact which speaks volumes in favour of the voluntary and sensorial character of this singular attribute—spontaneous motion.

We have another familiarly-known instance in the dioncea muscipula, Venus's fly-trap, a native of Canada, spreading upon the ground the peculiar leaves which have originated its name. They are provided with teeth, and have the appearance of a rat-trap—a comparison which applies to their function as well. When the insect alights upon the leaf, and touches its midrib, it is instantly caught by the springing up of the lateral valves of the leaf; and so great is the force and velocity of this act, that the fly is crushed to death. There has been an ingenious surmise that the object of this contrivance is to furnish the plant with a species of food for which it seems to entertain this extraordinary predilection. There is a humble, and, by contrast, a feeble instance of a similar nature in a little British plant called the sun-dew, found growing in bogs and wet heaths, the leaves of which are covered with a gummy exudation, which prevents the escape of the insects alighting upon them, and these are subsequently further secured by the leaves slowly folding over them.

Decandolle tells us that there is a species of acacia, a native of Senegal, which goes by a name corresponding to 'Good-morning;' because, when touched, its leaves bow down as if to salute those who touch them. There is also a plant, a native of Dominica, called 'the sentinel,' from the fact that its leaves keep up, as it were, a constant watch: one of them is always on the *qui vive*: the leaf is bent down, then rises and assumes its erect position, and there is an uninterrupted succession of such evolutions in this curious plant to the ample justification of its appropriate title.

Of all the wonderful movements in plants, there is not one which excites more astonishment than that of the *Desmodium*, or *Hedysarum gyrans*: we could not find a more appropriate name for it than the 'vegetable chronometer.' Its habitat is the banks of the river Ganges, where, indeed, under the fostering influence of the fertilising mud, the humid air, and the fervid sun, it is alone to be found in the plenary enjoyment of its remarkable powers. Beneath the slanting sunbeam and the muddled air of our own climate, even in our best stoves, the movement, *there* so vigorous, dwindles to feeble agitation—sufficiently remarkable, however, to make it one of the curiosities of the conservatory. It requires a temperature exceeding 100 degrees Fahrenheit for the full development of its mobile powers.

The lateral leaflets of the plant are in perpetual motion under favourable conditions—a motion of a periodic character. One leaflet will rise until it attains a considerable angle, and then, by a succession of little starts, comparable to the intermitting motion of the second's hand of a watch, it is depressed to an equal angle, and then begins to rise. While one leaflet rises, its fellow falls, and between them they keep a continual oscillatory motion. This movement does not cease during the night: in fact, in its own climate, it has a fair title to the perpetual motion award. It is remarkable that, even if the leaf is held between the

finger and thumb, and forcibly prevented from moving, it will, as soon as it is set at liberty, immediately recommence its movements, and with accelerated velocity, as if the power had been accumulating during the interval. The direct rays of the sun, or movements in the atmosphere, are not the causes of, neither are co-operative with, any other cause of these movements, as they are most lively in the shade, and when the atmosphere of the stove is perfectly still.

The last example to be here enumerated, approaches in its character so nearly the motions of the humblest members of the animal scale—animalculæ—that it is really hard to call it anything else than a vital phenomenon: it is the motion of the oscillatoria, a genus of confervæ. Upon the field of the microscope they appear like an infinite multitude of filaments, having a greenish cast, intersected by many articulations or divisions. They are seen to twist about from right to left, in a manner bearing the most direct resemblance to the writhings of worms. They travel, when unconstrained, to distances many times their own length, in water, in the course of a few hours.

It remains briefly to indicate the existence of what may be called movements in closed cells in vegetables. In the Cheledonium majus, a peculiar vibratory motion has been detected, affecting the particles of its yellow sap. This is destroyed by cold, and is subject to a curious intermittence in the occurrence of the vibrations. The chara, an aquatic plant, affords us the best-known example of this kind of motion; its stem is formed of elongated cells, which, under microscopic examination, are found to contain a transparent liquid, with globules floating in it: these globules move up one side of the cell and down the other, in a continual circuit, the motion in each cell being independent of that in immediate relation with it. No cause has hitherto been distinctly assigned to this phenomenon—it is one which obtains in many aquatic plants. The globules are believed to be starch vesicles.

The sertularia, campanularia, and tubularia, among polypes, possess a circulation which has some resemblance to the above. A current of granular particles, having a motion like that of sand in an hour-glass, has been discovered to set along the axis of the tube, forming portions of the stem and branches, to continue in one direction for a short time, then immediately to return in the opposite. Sometimes the granules have a vibrating, dancing motion: in the tubularia, a current sets up one side of the tube and down the other, as in the chara.

The cases just cited bring us to the confines of the two kingdoms. They have been quoted, not as instances of a motion strictly deserving the epithet 'spontaneous,' but to show that the distinctive characters of each, with immediate reference to the attribute in question, are so finely shaded into one another, as to defy all attempts at an artificial separation.

It is hoped that motions sufficiently singular in themselves, but of a mechanical, and a purely mechanical character, will not be confounded, as they too commonly are, with the kind of movement here described. Thus the spring and detent of some seed-vessels, the hygrometric closure of some flowers—everlasting flowers, for instance—will open and close for many years after they are dead, if alternately exposed to moist and dry air. The forcible action of the squirting cucumber—Momordica elaterium—the up-tendency of the iridaceous corm, however deep it is buried, and the upward rising of the roots in palm-trees, are curious and interesting in themselves, as evidences of the effects of certain physical laws, but are not to be reckoned in physiological importance with the simple act of the unsheltered snowdrop—an intuitive avoidance of evil.

In many of the spontaneous motions here enumerated, we are permitted to discover the immediate end which they serve; for others we are still unable to assign a cause or an object. It would not be the least important of the ends served, if, by the demonstration of a power of motion of inscrutable origin, we might be taught that the resources of the Divine architect are deeper and richer than the narrow confines of our too conceited philosophy can circumscribe, and than, moreover, in our investigations into his handiwork, we are at all times ready to allow.

A DAY AT DE LA RUE'S.

CONCLUDED.

On being conducted into that department of Mr De la Rue's establishment which is devoted to the making of post-office envelopes, I had before me a busy scene of machines and human labourers — pulleys whirling overhead, belts driving wheels below, and an incessant clank-clanking noise, which renders it necessary to speak somewhat louder than a whisper, if one has any particular wish to be heard.

With respect to the material on which all this activity was exerted, I had seen it prepared some time ago at a mill in Hertfordshire. It is made, like any other ordinary paper, at a machine, and with a sufficiency of size in the pulp to prevent the ink from running. The introduction of the threads is a matter of extreme simplicity. From reels suspended over the pulpy substance as it goes below the first pair of cylinders, threads are led down and inextricably crushed into the web. After being cut into sheets, the paper is taken in reams to the factory which I was now visiting.

When the paper comes into the hands of Mr De la Rue, it is so far unfinished on the surface that it requires to be milled, by being put through rollers in the manner which I have already described for smoothing sheets of paper or card. So much care is taken to insure finish of surface, that each sheet is milled five or six times before it is considered perfect. When it has undergone this tedious process, the sheets are laid in handsful, of about six inches thick, beneath a cutting apparatus, which, for want of a better simile, I must describe as acting on the principle of the guillotine. A great broad knife is pressed by a powerful action down on the paper, and with the utmost ease severs the mass in twain. Having been cut into breadths, the paper is next, by the same instrument, formed into lozenge shapes—this producing the least possible waste of material. In this form the paper is handed to the succeeding machine, where, coming under the action of descending angular chisels, small pieces are smartly notched from the corners, and the envelope is made, all except the stamping and folding.

Following a natural course of things, the envelope paper might now be expected to be carried to an adjacent apparatus for impressing the medallion stamp, which is to give it currency through the post. Circumstances divert it from this direct course. The presumed necessity for keeping a careful watch over the dies, prevents government from employing any but their own officers to impress the medallions, and the operation is accordingly performed at Somerset House, which, with a knowledge of this eccentricity of movement, I had visited the day previously. Conducted down to one of the lower floors of this large government office, I there found, in an apartment overlooking the Thames, a number of machines, of a very peculiar construction, engaged in stamping or printing the medallions. These machines, which, I believe, are the invention of Mr Edwin Hill, superintendent of the stamping arrangements, may be considered as forming a combination of the printing-press and die-stamping apparatus. All are moved by a steam-engine of two-horse power. At each press are two lads, one placing the papers below the die, and the other removing them. The impressions being effected at the rate of sixty in the minute—an amazing celerity, considering that the die is inked at every impression—the laying down and taking up require a sharp eye, and no small expertness of fingers. In such processes, every little matter re-

quires to be studied, in order to economise time and trouble. Were a boy to try to lay down sixty pieces of paper in a particular manner within the period of a minute, without once missing, he should certainly fail in the attempt, unless he arranged the papers in a way convenient for handling before he began. The spreading out of the papers into handsful, in the shape of a fan, is on this account an indispensable preliminary in the operation I am now describing. I was told that there is even a knack in rapidly forming the fans. After much experience, it has been found that it can be most expeditiously done by throwing the papers on a table covered with soft cloth, and passing a brush over them. Who, on using an envelope, could imagine that the mere mode of handling it has been a subject of so much solicitude?

In stamping, the die is suspended over the paper on which it is to be impressed, and consequently the inking is effected by rollers pressing upwards. Having thus to work contrary to gravity, the rollers require to be artificially pressed upon the die; and Mr Hill's device of springs acting on the rollers to accomplish this object is at once simple and ingenious. So also is there great merit in the method of shortening and lengthening, at each impression, the screw and bolt apparatus to which the die is suspended, in order to afford room and time for the action of the rollers. It consists in interjecting and withdrawing a piece of metal at every lift and descent of the screw over the bolt: in other words, the power acts, first, by means of a rapidly-working screw; second, the piece of metal which is pushed below it; and third, the bolt to which the die is attached—all three being kept in a vertical line by the supports of the apparatus. The number of papers stamped by each press is, as I have said, sixty per minute, at which rate several machines, with their attendants, work six hours daily; which, although little more than half the time occupied in ordinary printing-houses, is, all things considered, a fair amount for a government office.

Stamped and counted, the envelopes now retrace their steps to Mr De la Rue's establishment, to which I again invite attention. Greatly as I had been delighted with the operation of stamping, I was still more pleased with that which now came under my notice. In folding an envelope, six movements are necessary. First, the paper must be laid down; four flaps must next, one after the other, be turned over; and sixthly, the envelope must be withdrawn, to make way for its successor. All these movements, except the laying down, are performed by a machine of the height and size of a small table, with some interesting apparatus arranged over its surface; the whole the united invention of Mr Edwin Hill and Mr Warren De la Rue. A boy having laid down a lozenge-shaped paper, a hammer falls, and knocks its square central part into a crevice; and on the hammer rising, we see the four corners standing erect—the envelope having taken the form of a box, with standing sides and ends. A broad iron thumb, as I may call it, now rises and presses down one of the ends, another thumb presses on the opposite end, and next the two sides are similarly flattened. The envelope being now made, an iron arm comes forward with a rapid jerk, and with two fingers draws it away. It is not drawn aside into an indiscriminate heap, but is brought to a halt upon an endless strip of cloth, which, travelling over two rollers at a slow rate, gathers the mass of envelopes into regular bings, and thus obviates the necessity for shaking them even. The action of what I call the fingers is curious. Instead of drawing away the envelope, as if by hooked claws, the effect is produced merely by touch, the same as if you were to pull towards you a sheet of paper by the tips of two fingers. How two metal pointers could perform this delicate operation is the wonder. It is indeed a curiosity in art. The explanation is, that the pointers are tipped with India-rubber—a substance which will readily draw aside any light object by the touch, as an experiment with a morsel of rubber and sheet of paper will convincingly show. The interest attached to this apparatus is increased by observing that when the boy fails to place an envelope-paper on its appointed place, the two fingers are projected outwards, and do not dip down to draw the envelope aside—as if there was a consciousness in the machine that any effort on this occasion would be thrown away.

The whole of the process, of which this affords the scantiest outline, is a rapid evolution of parts all acting in harmony to effect a particular end, and without any perceptible interval of repose. The rapidity may be judged from the fact, that two thousand envelopes are folded per hour, or twenty thousand in the day. Yet this degree of quickness, I understand, is already beginning to be considered slow work, and will not be tolerated much longer. I should not be surprised, at my next visit, to see four times as many envelopes made in the hour, and the whole at the same time gummed and counted. As it is, the machine cannot keep the stamp-office supplied; and many girls are employed in executing quantities by hand-labour. At a former visit a year or two ago, I found that all the envelopes were folded by girls; and so active were they, that I could not have anticipated the invention of anything more smart or economical. The result shows how useless it is for an onlooker to speculate on such matters. But still more useless would be the sentimental maunderings of those who affect to lament the substitution of iron and power-belts for human muscle and intelligence. The more machines Mr De la Rue introduces into his workrooms, the greater is the number of hands he requires to employ. 'So far,' said he, 'from the folding-machine robbing our girls of their employment, we have more work for them than ever.' One can only have a forcible perception of the truth of this remark, by having visited, as I did, the establishment at two distant periods. On the present occasion, when conducted into the manual-labour rooms, I found that department thronged from the garret to the cellar—a houseful of girls, all as busy as possible at agreeable and remunerating labour; many folding at long tables, others gumming, and a third class finally putting the envelopes in packages ready for sale. The place was in itself a factory, and not the least interesting or curious on various accounts. As all the envelopes, whether made by machine or with the folder, pass through this department, I inquired how many were turned out in any given period of time. The answer was, that the quantity of envelopes altogether made was seventy-five thousand a-day, or twenty-two and a half millions per annum, but that this was only those stamped for the post-office. The quantity of fancy envelopes manufactured was equally large. This led me to an examination of the kinds of envelopes made without stamps, of which there were numerous varieties in progress. One species were without borders; others were bordered with red, blue, or some other fancy colour; and a third kind had narrow or broad borders of black for mourning. The preparation of mourning note-papers and envelopes seemed in itself a great concern. The putting on of the black I did not see, that being done out of the house by a person whose business is the blacking of paper. 'To give you a notion of the extent of this kind of trade,' said Mr De la Rue, 'I may mention that we pay £500 a-year for merely blacking the edges of note and envelope papers.' Equally ready, however, to play the part of L'Allegro as Il Penseroso, this great man has not disdained to bring his ingenuity to bear on the important subject of matrimonial stationery. I am rather inclined to think that De la Rue prides himself a little on what he has accomplished in this way. And who that recollects what marriage-cards were a few years ago, can wonder at a man being proud of being the purveyor of such splendid things as now charm the eyes of misses—names, borders, wafers, and true lovers' knots, all in a blaze of enamel and silver!

Pleased with the way in which these pretty articles were got up, I felt a reluctance in quitting the department to visit that part of the premises devoted to ena-

melling, colouring, and varnishing. Enamel is a wash of a material externally resembling whiting, which, after being dried on the card or paper, is smoothed by milling. The mode of applying the wash is the only part worth noticing. I found several workmen and boys engaged in laying the wash on webs of paper, each three hundred yards long; and this length they finished in half an hour. The actual operator, however, is a machine, and the men and boys are only attendants. The web, in going into the machine, passes beneath a trough, from which the wash issues over the surface; it then comes under the action of an apparatus of brushes, moving in cycloidal curves, by which the wash is finely equalised; led away from this, the web sinks through a hole in the floor to an apartment beneath, where it is caught by a boy, and hung on poles to dry. The paper undergoing this initiatory process of enamelling at the time of my visit was that designed for covers to 'Chambers's Miscellany of Useful and Entertaining Tracts,' of which some hundreds of thousands have been prepared.

The adjoining workroom, in which papers are coloured and varnished, had somewhat the appearance of a painter's and dyer's atelier. At various benches, girls were employed tinting sheets of paper by means of brushes and colours; others were putting varnish on the dried sheets; and a few were laying squares of leaf metal on paper preparatory to future processes. Much of the coloured, as well as the metal-covered paper, is designed for embossing; hence it was natural for us next to look in upon the apparatus employed in giving the embossing or stamping finish to the material. Embossing is done in two ways—whole sheets by means of rollers, and small slips by means of powerful stamping machines. In little more than an instant of time, a sheet, formerly smooth, will pass between rollers, on one of which the pattern is engraved, and come out beautifully marked in relief. The appearance of morocco leather is thus given to coloured papers. The process of stamping is performed on the ground-floor, in consequence of the enormous weight of the presses. The largest of these machines is about eighteen feet high, weighs twenty tons, and imparts a blow equal to a thousand tons. From my previous acquaintance with machines of this class, I should have expected that the Goliah before me would require great toil in working, and was therefore agreeably surprised to find that it performed the falling and rising process with comparative ease and equability. Two men only were in attendance upon it: one placed the slip of paper below the die, taking it out when stamped; the other guided the movement, by putting the machine in and out of gear with the steam-power. The blow being given with a rapid and ponderous jerk, which shook the ground and building, the reaction caused the screw to run back, leaving time to shift the paper for the ensuing impression. The article which was in hand during my visit was what few persons could have expected—the fancy slip of paper which is wrapped round pieces of linen. It is very true that linen is not a whit the better for ornaments of this kind; but it is equally undeniable that people are taken with such embellishments: the eye is pleased, if not the judgment, and how much are all mankind imposed on by what charms the senses! As to the slip in question, what was it radically but a bit of paper, not worth a farthing? Yet what did art not do for it? In the first place, it daubed it over with a pea-green colour; next, it gave it a gloss rivalling the surface of polished marble; then it pasted upon it, in the form of a medallion, a small representation of a flower on a white ground; after this, it laid leaves of gold upon it; and lastly, giving it a blow with a die, there sprung up in relief a beautiful golden efflorescence, surrounding the medallion, and radiating over the delicate green expanse of the slip. The execution of the design on the die was an important step, not to be overlooked; for, independently of all manual labour, the drawing, effected by one of the first artists of the day, cost as much as twenty guineas. Thus it is that things are done on a great and liberal scale in large factory concerns; the most insignificant materials being exalted to a high value by the varied and ingenious operations of artists and artisans, set to work by capital and enterprise.*

In the same department I observed several smaller stamping-presses engaged on different articles requiring to be embossed. One was employed in embossing a highly ornamental calling card: the relief in this instance, however, being open, to resemble lace. The card being first embossed by a blow of the die, is next laid, face downwards, on a block, and in this position the raised dots are filed off; consequently, on taking it up, we find that the embossing is full of small holes. Another press was engaged in stamping leather for the covers of work-boxes and writing-cases. Near to this scene of labour I was shown the process of printing in metals. A number of small presses of an ordinary kind, and several men and women, are here occupied. Printing to resemble gold and silver has been brought by Mr De la Rue to considerable perfection; and yet it is so simple, that I can see no obstacle to its general use. Properly speaking, the metal is not printed, but laid on the typography after the sheet comes from the press. Instead of ink, the types are rolled with a glutinous substance, to which metal in powder readily adheres. The metal, to resemble gold, is an oxidised brass; and so vast has become its consumption, that there is now a manufactory of the article in London. Beat first into leaf, it is afterwards ground to powder; and the daubing of this powder on the typography appears to be the duty of the workwomen. In this manner all those covers of packages containing note-papers, which blaze in gold and silver, are produced. After printing and metalling, the papers go through a wash and milling, to impart a glossy finish.

From the metal-printing department I was led up stairs to that in which are manufactured all varieties of portable writing-desks, work-boxes, and cases, also portfolios, albums, needle-books, and other loves of articles that no young lady could for an instant see without meditating an attack on papa's pocket. Here, likewise, I was made conscious for the first time of that great work of art, a portable chess-board—a thing made of pasteboard, which, with pieces and all, you can fold up in your pocket, so as to be able to carry on a game in a stage-coach, railway carriage, or steamboat. Invented by a learned professor, this little affair has, to use De la Rue's gratulatory expression, 'taken root,' and is therefore likely to turn out a good thing for the concern. To chess-players, I should imagine it to be an indispensable pocket companion. Unable to save themselves, they may just as well go and buy one of these portable boards at once, as wait to perform that act ungraciously afterwards.

I had now seen pretty nearly into all the odd nooks of this interesting establishment, and my last move was into the store-room, in which were engaged ten clerks and packers despatching goods to all parts of the empire. Here, in conversing with one of the partners, I learned that the whole house is under from fifteen to twenty foremen, with each of whom a debtor and creditor account is kept, as if he were an independent tradesman. It is only by such minute arrangements that a dispersed miscellaneous establishment like this could be conducted with propriety or advantage. At any given time, it can be ascertained whether any particular branch is yielding work proportional to the expenditure upon it. A number of the foremen were originally lads employed in the early years of the establishment; and with them, as well as with others, the masters are upon a most amicable footing. Solicitous to

* While on this subject, it is not out of place to speak with admiration of the embossing of card-board by Messrs Dobbs, Bailey, and Co., of 134 Fleet Street, London. By them bas-relief copies of the cartoons of Raphael, and the masterly pictures of Wilkie, also relievo maps of different countries, have been executed with much taste, and at a comparatively insignificant cost.

improve the condition of all in their employment, the proprietors have latterly induced them to abandon the practice of taking beer twice during the hours of labour, and in lieu have remitted half an hour from the general day's work. A marked social improvement has been the consequence. Latterly, also, a sickness-fund and library have been set on foot in the office. As these useful institutions have a reference to something like three hundred individuals, the degree of benefit is of more than ordinary importance.

There was now nothing more for me to see or hear of in connexion with this extensive establishment, and thanking my friendly conductors for the trouble they had taken to explain the different processes, I concluded what I hope will have been as little tiresome to my readers as to me—'A Day at De la Rue's.'

OCCASIONAL NOTES.

DISCOVERY OF COPPER MINES IN AUSTRALIA.

After the great depression which the Australian colonies have suffered of late, it is gratifying to find that a new impulse has been given to the energies of the colonists around Adelaide by the discovery of rich mines of copper. The discovery of the copper ore was entirely accidental. A son of Captain Bagot, in his chance rambles, had picked up a greenish stone, and carried it home, where it excited some attention. A short while afterwards, Mr Dutton, having gone to the same locality in search of some stray cattle, was attracted by a greenish-looking substance imbedded in the shaly rock, which there rose to the surface. He carried home a specimen, and, showing it to his friend Bagot, it was ascertained to be an ore of copper of the same nature as the specimen found by his son. The next object of these enterprising gentlemen was to get possession of the land embracing this hidden treasure. This they did by a regular purchase from government of eighty acres, at the price of one pound sterling per acre. It appears that there is no reserve made by government in the sale of lands, but that all minerals, and everything else, become the sole property of the purchaser. As the copper ore in this locality comes to the surface of the soil, the working of such a mine is a comparatively easy task; and some Cornish miners being on the spot, operations were commenced immediately, and in due time a quantity of the ore was sent to England. It was found that the ores consisted of a carbonate and sulphuret of copper; and so rich were they, that, on an average, they furnished 29½ per cent. of pure metal; and the sale of the ore at Liverpool brought an average of L.24, 8s. 1d. per ton—a price greatly above that of any British ores, or even of those of South America, with one exception. The average price of British and European ores is from L.5 to L.6 per ton; and the South American brings from L.10 to L.15, the richest being L.29. The enterprising proprietors of the Kapunda mine, ascertaining that some adjoining lands contained copper also, became purchasers of additional ground; but the value of the mines having now to some extent transpired, the price per acre was raised tenfold. Another locality containing very rich ore was soon after discovered in the Mount Lofty range of hills, about ten miles from Adelaide. This, called the Montaculi copper mine, has been purchased by a company, and is now also in full operation. From the number of buffaloes in the country, the facility of carrying the ore to the shipping port is very great. Improved modes of roasting the ores, and thus lessening greatly their bulk, is also being adopted. The whole colony is in activity, and the trade, if pursued with moderate caution and prudence, is likely to be of essential importance to the community. Not only is the British market open for the commodity, but there is also a wide field in India, China, and other parts of the world.

A volume just published by Mr F. Dutton on South Australia and its mines,* affords an interesting detail of this recent discovery, as well as the most recent notice of the trade and prospects of South Australia. The colonies appear to be gradually recovering from the late effects of over-importation and excessive speculation. Cattle and sheep are in such abundance, that the principal consumpt consists in melting down the carcasses in order to obtain their tallow. The newly-discovered mines, however, promise to employ somewhat more profitably the muscular powers of the buffaloes, as well as to furnish steady and profitable labour to a considerable number of miners, engineers, and other artisans required for mining operations.

IDIOCY.

Dr Campbell, in a communication published in the Northern Journal of Medicine, states, on the authority of Dr Kombst, that an unusual number of idiots and deformed persons are to be found at Jena, in the Grand Duchy of Weimar. This fact is, by the medical men of the place, coupled with the circumstance of there being brewed at Lichtenhain, a neighbouring village, a very strong beer, of pleasant taste, which is a great favourite with the inhabitants of Jena. This beer is very intoxicating, and the state of intoxication produced by it is far more violent than that brought about by any other beverage in common use. These highly-intoxicating qualities of the Lichtenhain beer are ascribed to belladonna, which, it is said, the brewers mix with the beer. Now, no day passes without some of the inhabitants of Jena returning home in the evening highly intoxicated; and the idiotic and deformed children are regarded as the offspring of fathers addicted to this pernicious beverage.—This is a curious surmise, and one which after-experience is most likely to confirm; for there is no reason why mental deformity should not be transmissible as well as physical malformation—which, unluckily, is but too well-authenticated. And should it be confirmed, what a fearful responsibility do such men incur, who, through vicious propensities, not only destroy their own constitutions, but transmit to their innocent offspring an enfeebled frame, and the worst of all maladies—a hopeless imbecility of mind! Our chief distinguishing characteristic in creation is mind, the noblest of all the Creator's gifts; and no offence can be more enormous than the debasement of that gift by voluntary indulgence in gross and unseemly practices. Most people, indeed we might say all, make a great profession of regard for their offspring; but we question that sincerity in every case where there exists not a strict attention to such habits of life as will, to the best of human knowledge, secure for that progeny a sound and healthful constitution. The basis of a sound constitution, bodily and intellectually, is infinitely more valuable than any other bequeathment a parent can make. Without the one, life cannot be an enjoyment; without the other, progress is utterly unattainable.

NOVEL IMPORTATIONS.

Some ten or twelve years ago, people were amazed when fresh eggs and butter, live poultry and cattle, were steamed from Ireland and the north of Scotland for the consumption of the great metropolis; now what shall they say to arrivals of live turtle and pine-apples from the West Indies, early potatoes from the Bermudas, and potatoes, green-pease, and young onions from Portugal, and cucumbers from Holland? Yet such

* South Australia and its Mines. With an Historical Sketch of the Colony, under its several administrations, to the period of Captain Grey's departure. By Francis Dutton. London: Boone. 1846.

is the case. Turtle, if we can credit the newspapers, will shortly be as common as veal, and pine-apples be placed on every respectable table, not, as formerly, on loan from the fruiterers, but the *bona fide* to-be-enjoyed property of the host. Last summer we had several arrivals of pine-apples, and this season we see four already announced, so that ordinary-sized pines, of delicious flavour, may be calculated upon at scarcely one-tenth of what they would have cost under the uncertain and scanty supply of the home grower. Early potatoes from the Bermudas and Portugal, anticipating our own supply by a month, is certainly a novelty; and we see no reason why, instead of 'two hundred and fifty-five barrels,' there may not be fifty times that amount, and yet the importer meet with a fair remunerating profit. In our northern latitude, we need never hope to compete in earliness with the more favoured climates of Portugal, Madeira, and the West Indies; but by our steam navigation, which makes these countries, as it were, part and parcel of our own island, we may enjoy, at a reasonable expenditure, all the delicacies of the tropics, and yet secure the healthful invigorating advantages of our own temperate clime. Nor, under the cultivation of peace and the extension of steam navigation and railways, do we see any limit to this gratifying interchange of commodities. We have now American ice, as well as American cotton and corn; West India turtle and pine-apples, as well as West India rum and sugar; early potatoes, green-pease, and grapes from Portugal, as well as Portuguese oranges, raisins, and wines—nor is there any cause why we may not have every other foreign delicacy, however rare and evanescent.

DISEASE OCCASIONED BY LUCIFERS.

Dr Balfour, in the Northern Journal of Medicine, describes the occurrence of necrosis in the jaw-bones, caused by continued exposure to the fumes of phosphorus, in persons employed in the lucifer manufactories. The dipping the pieces of wood in the phosphoric mixture, and the drying the matches afterwards, it appears, are carried on in an ill-ventilated room, where the girls are who are employed in the factories, and who pass from twelve to thirteen hours daily in these rooms, exposed to excessive heat, and the fumes given off by the phosphorus which is used. In each manufactory from three to four pounds of phosphorus are daily employed in the production of from one to two millions of matches, the mere drying of which must give no inconsiderable quantity of phosphoric fumes, to which also must be added the quantity of metaphosphoric acid produced by the burning of sundry parcels, which, in spite of care, is no infrequent occurrence. It would seem that continued exposure to the phosphoric fumes for a length of years is requisite to produce the disease, as no cases were observed at Vienna until the manufactories had been at work upwards of eleven years. Scrofulous subjects suffer most, and in them the disease is most fatal. Almost all the girls employed have the gums more or less affected, and at their junction with the teeth, a red ulcerated line, like that produced by mercurial salivation, is apparent. When the individual is robust, and the necrosis confined to a small portion of the bone, exfoliation takes place, and a gradual cure follows; but where there exists any tendency to scrofula, phthisis becomes developed, and the patient sinks under the combination.

To counteract, as far as possible, this distressing malady, the Austrian government has, with praiseworthy alacrity, ordained the observance of the following precautions:—1st, That the matches must not be permitted to be dried in the workroom, and, if possible, this must take place in one situated above it; 2d, that every second hour the girls be obliged to wash their mouths well with acidulated water; and 3d, that they be sent out twice a-day to take their meals, and get some fresh air. These precautions are ordained on the recommendation of a medical commission; precautions which, with the addition of frequent washing, and exposure of the cloths to air and sunshine, might be beneficially adopted in many of our large factories, where metallic and other fumes are continually being less or more inhaled by the workpeople.

AN EASTER RAMBLE IN THE NETHERLANDS.

FOURTH ARTICLE.

BRUSSELS—THE OLD AND NEW TOWN—THEATRE—THE HÔTEL DE VILLE—THE CATHEDRAL—IMAGE-BREAKERS—GALLERY OF THE DUKE D'AREMBERG—THE LAOCOON—THE MANNEKIN.

We arrived at Brussels, which is the Paris of the Netherlands, the following afternoon, and drove in an open carriage through the old and new town, round the Park and the Boulevards, and along the *Allée Verte*, as far as the palace of *Laeken*, where King Leopold frequently resides during the summer months, and which is memorable for having been the abode of Napoleon when, in an evil hour, he completed the arrangements, and signed his final instructions, for the Russian campaign. Upon a general view, it would appear that Brussels consists of two distinct towns—the one ancient, the other modern—which are connected together chiefly by a long and precipitous street, appropriately called the Montagne de la Cour. The lower or older town possesses all the aspect of antiquity: it were easy, indeed, to imagine ourselves here living in the middle ages, so remarkable is the architecture of the houses—the visible chronicles of bygone centuries. Their remarkable height, their step-shaped curious old gables, their occasional parapets and high-sloping roofs, with rows of little grim lattice windows, intimating storey still rising above storey within, and their highly-decorated façades, produce an effect which is exceedingly picturesque and interesting, contrasted with which the new or upper town presents a very tame and monotonous appearance. True, the white-faced mansions and stately palaces are there obviously on a magnificent scale, and give an air of aristocracy and regal dignity to this court end of the capital. The greatest ornament in this part of the town is the Park, with the king's palace at one end, and the government offices at the other. This open and verdant space is tastefully laid out, with shady avenues interspersed—as all public gardens are on the continent—with statues, busts, marble vases, and occasional fountains, which, judiciously distributed among the trees and shrubberies, have always a graceful effect. We passed also through a very pretty modern little square called the Place des Martyrs, in the garden of which is the statue of Liberty, dedicated to the memory of the heroes who fell during the conflict of the late revolution.

Returning into the old town, we arrived at the Place de la Monnaie, which is by far the most lively and bustling part of Brussels—almost completely surrounded with handsome-looking cafés, fitted up in the most costly Parisian style, before the doors of which were already groups of persons seated at small tables discussing their coffee or wine; the younger men smoking cigars, and the elder playing at dominos. It is very evident that people on the continent accustom themselves to enjoy life in the open air more than they do in England. We have seen in Paris young ladies—we might rather say families—bring their needlework into the garden of the Tuileries, and, paying each a penny for their chair, remain there the whole day, returning after dinner to their evening promenade. In the large square I am speaking of is the theatre-royal, a plain-looking, but handsome edifice, which may hereafter be esteemed less memorable from any association connected with the muses, than from its having been the place in which the revolution of 1830 received its first impetus. On the 25th of August, the opera announced for representation was the Dumb Girl of Portici. The house was crowded in every part, and the most enthusiastic cheers greeted those airs which breathe the spirit of liberty. On the outside of the doors groups

of idle people were collected; but neither the civil nor military authorities apprehended any disturbance. At ten o'clock a crowd of young men, excited by the gesticulations of the Dumb Girl, and the patriotic ebullitions of Masaniello, rushed into the streets, shouting '*Vive la liberté!*' '*Vive la Belgique!*' '*A bas Van Maanen!*' who was at that time the obnoxious minister of justice. They met with no resistance: they paraded the streets, smashing lamps and windows, until so formidable became the mob, that the gensd'armes were afraid to interfere. They at length broke into the shops of gunsmiths, and otherwise provided themselves with every description of arms; and then proceeded to the house of the offensive Van Maanen, into which they forced an entrance; and after destroying the furniture, and everything they could find, they set fire to the premises. The flames, agitated by the wind, rose with terrific grandeur, and threatened to destroy the surrounding houses; for no engines or means of extinguishing the fire were permitted to approach. Thus, before daybreak, the town was in a state of open and complete insurrection. Hence the first act of this revolution, which separated Holland from Belgium, originated within the walls of this theatre. The influence of dramatic representations in exciting the feelings and passions of the people is particularly marked on the continent, where the stage has often been made subservient to political purposes. Thus Napoleon never allowed any drama to be represented in Paris which he had not himself examined and revised; and he often introduced such sentiments as he wished to be encouraged among the people.

We next stopped at the Hôtel de Ville, or townhall; and while admiring the beauty of its architecture, the coachman, pointing with his whip, directed our attention to an opposite house. 'There,' said he, 'that is the old house in which Counts Egmont and Horn slept the night before they were executed; and here,' added he, 'in this place they were both beheaded.' So true is it that tragical events take precedence over all other local associations; and yet, were such here more particularly individualised, a tumulus might be raised at every door. The fate of these two noblemen has deservedly met with sympathy: they were, in the highest sense of the word, patriots; and they both fell victims to the treachery and cruelty of the Duke of Alva, who signalised his return into Brussels, after the dissolution of the confederacy which had been organised to shake off the Spanish yoke, by an indiscriminate number of executions.

The Hôtel de Ville is considered a very fine example of what is called the Lombardo-Gothic style of architecture, and is surmounted by a very light and elegant spire, in open fretwork, through the sides of which the sky on either side is visible. Upon its top is a statue of St Michael, the patron saint of Brussels, which swerves to and fro with the wind, and serves as a weathercock. This spire is remarkable for not being in the centre of the building; still the defect does not impair, at least to an unprofessional eye, the beauty of the edifice. The interior possesses little to interest the visitor, excepting the salon or hall in which the Emperor Charles V. abdicated his throne. Here, rising from his chair of state, supported on one side by his sister, the queen-dowager of Hungary, and on the other by his son, in the presence of the august assemblage which he had convened to give befitting solemnity to so important an event, the enfeebled monarch, with 'an air of dignity, without ostentation,' explained the reasons which induced him to resign the sceptre which he could no longer wield for the benefit of his people; and his son, kneeling at his feet, received that wise and paternal admonition which should be inscribed on the hearts of kings. This interesting event is depicted on some curious old tapestry. From the town-hall we proceeded to the ancient cathedral, which is dedicated to St Gudule, upon entering which, we proceeded at once to the extraordinary pulpit of Verbruggen, one of the most curious and elaborate specimens of oak-carving in the Netherlands. The English guide-books all refer to it with admiration, but not one of them describes it; neither do they give the popular story connected with it. The subject is the representation of Adam and Eve being driven out of Paradise. Underneath, and in the foreground of the pulpit, appear the guilty pair, their figures being somewhat larger than life. Adam is represented turning round from Eve, covering his face with his hands in a penitent attitude; while she, standing by his side, hides in her left hand the apple, and uplifts the right to protect her face from the fiery sword of the cherubim, who is immediately over their heads. The despondency and grief expressed by the countenance of Eve are finely depicted: the drapery of the figure is also extremely well managed. Immediately behind them is the skeleton of Death, grasping with his bony hand the pulpit, and looking steadfastly down upon Eve, under whose foot, among the trees which support the pulpit—the rugged bark and woody knots of which are given with great fidelity—the serpent appears, and may be traced coiling upwards, and behind the pulpit, until it reaches the summit of its canopy, upon which stands the Virgin, with a glory of stars round her head, and the infant Saviour before her, through whose tiny hand passes the crucifix, the point of which she appears thrusting into the serpent's head. The effect of the grouping, as a whole, is exceedingly striking. The balustrades on each side of the pulpit stairs appear to consist of the branches of trees, well foliaged; among which, with artistic eccentricity, are disposed numerous animals—a peacock, a squirrel, an eagle, a parrot, and other creatures, some of which it would be difficult to discover in any work of natural history.

The cathedral of Saint Gudule possesses many fine statues and interesting monuments. It was enriched at one time by sixty altars, which were magnificently wrought; but they were all destroyed during the insane riots of the Iconoclasts, or Image-Breakers, at the Reformation. In the blindness of their zeal, they armed themselves with hatchets, bludgeons, hammers, and other weapons, with which they broke into the chapels and churches, and destroyed what they considered to be symbols only of idolatry. This cathedral was attacked by torchlight, at midnight, by an immense multitude of armed men; and the systematic manner in which they accomplished its pillage, without a single accident happening among the tumultuous evildoers themselves, has been a subject of wonder to historians.

The museum, and more especially the library connected with it, which contains an invaluable collection of manuscripts and rare editions of scarce works, which have accumulated since the fourteenth century, might tempt a visitor to while away many agreeable hours in Brussels. There are here also, as in other towns in the Netherlands, several private galleries, to which strangers are courteously admitted, and which contain some charming masterpieces of the Dutch and Flemish schools. The palace of the Duke D'Aremberg, who resides the greater part of the year in Italy, is particularly worth visiting, not only on account of several exquisite pictures by Teniers, Van Ostade, Rembrandt, and Vandyke, but because in the library, in which are preserved numerous Etruscan vases and interesting relics of antiquity, will be found the original head of the Laocoon. We cannot, however, leave the picture-gallery without specially noticing a Madona by Otto Venius, the master of Rubens, which must haunt the memory of all who see it. She is kneeling before a cross formed by two little broken sticks. She is fair, possessing what the French would describe to be *une figure bien arrondie*, and without any affectation or St Cecilia upturning of the eyes. The sweetest serenity is blended with an expression of the deepest devotion. The colouring of the lilac gown, which we observe in many of this artist's pictures, contrasts with, or we should rather say heightens, the transparent complexion of the neck and shoulders, and the impersonation alto-

gether is most striking and beautiful. It is certain that pictures, like poems, affect the imagination of individuals differently; and this, to us, has always appeared a *chef d'œuvre* of art. To return to the Laocoon. This group, representing a father and his two sons struggling with unutterable agony in the coils of a serpent, which, from the numerous plaster casts of it, must be familiar to everybody, was discovered in the year 1508 by Felici de Fredis at Rome, in the ruins of the baths of Titus, the subterranean chambers of which are supposed to have contained some of the finest sculpture and paintings in the world. The excavations which were at that period commenced were discontinued, until the French set about exploring the ruins in earnest about the close of the last century. Instead of this group being, as Pliny the elder supposed, executed out of a single block, Michael Angelo discovered that the figures were executed separately, and the two sons joined with great nicety to the principal figure. It is certain that the head of the Laocoon, the principal figure of the group, which was removed by Leo X. to the Vatican, is a restoration, copied from an antique gem, and the original, now in the Duke D'Aremberg's possession, was, as we have reason to believe, discovered in these ruins by some Venetian explorers, who sold it to the grandfather of the present duke. The connoisseurs attached to the suite of Napoleon were so satisfied of its authenticity, that the emperor, under their advice, offered to purchase it at any price from the Duke D'Aremberg, who declined parting with it, and, for safety, had it taken out of the country, and concealed at Dresden, where it remained until the fall of the emperor, when it was restored to its present place. The head is slightly inclined to the left; the eyebrows are puckered together, or corrugated; and the ball of the eye, which is so chiselled as to represent the pupil, appears turning upwards. The mouth is somewhat open, the lips being drawn up to express acute pain; and, upon closer inspection, the teeth and tongue appear within it. It was observed by Sir Joshua Reynolds that the expression of suffering in this group is more strongly observed in the writhing and contortions of the body than in the features. In like manner Winckelmann observes that it is not in the countenance only, but in the tendons and muscles, that we must recognise the intensity of physical suffering; and the opening of the mouth indicates not the loud cry described by Virgil, but rather the sighs of suppressed agony. Here we may observe, that it was a general principle of the ancient sculptors, that to preserve the most perfect beauty in its most perfect state, the passions should not be expressed which may be supposed to produce distortion and deformity.* 'As the sea,' says Winckelmann, 'is calm in its profoundest depths, however agitated may be its surface, so in the Greek statues, in the midst even of the passions, the expression conveys the grandeur and calm self-possession of the soul. Such is the expression in the countenance of the Laocoon.'

We did not leave Brussels without paying a pilgrimage to the little street god, enshrined on his pedestal within iron railings, called the Mannekin—an eccentric fountain, in the shape of an indelicate pretty-looking boy, who continues to supply, unremittingly, the good housewives of the neighbourhood with the great element of cleanliness and life. The statue is in bronze, by Duquesnoy, and divers legends are attached to the history of this juvenile absurdity. Indeed the '*Histoire du Mannekin racontée par lui même*,' by a no less erudite author than Collin de Plancy, lies before us, by which it is obvious that this, 'the most ancient citizen of Brussels,' has been passively, but not mischievously, associated with all the civil commotions that have, since the twelfth century, disturbed the peace of this city. He witnessed the civil wars under the dukes of Burgundy, and blushed before the flames of the Inquisition under Philip II. He bowed to the dominion of the house of Austria under Maria Theresa, and wore the national cockade in 1794. He witnessed the rise and fall of Napoleon, was a *quasi* Hollander under William IV., and since the accession of the present king, Leopold, has sported the uniform of the garde civique. Hence, in accordance with the most enlightened principles of political philosophy, the Mannekin has accommodated himself to the exigencies of the prevailing dynasty, and has thus obtained military orders and court honours which only few even of our own ministers can boast of in the present day. The Emperor Charles V. settled a pension on him, to conciliate the good people of Brussels; and the Duke Maximilian, in 1698, seriously invested him with his order. Peter the Great came to see him, and bowing before him, said, 'Sir, I have come to see you, since you go to see no one,' and added to his pension. Louis XV. made him a knight of the order of St Louis, and presented him with a suit of uniform, a cocked-hat, and a sword. 'It is a positive fact,' says Addison, 'that, in addition to these gifts from sovereigns, several people have made the little man votive gifts, while others have actually remembered him in their wills. Within the last twenty years, a lady left him a "life annuity" of one hundred and twenty francs, for dressing him on fête days. He has a treasurer, who is responsible for his disbursements, revenues, &c.; and Mr Strass, an advocate of this city, some years ago held this enviable post.'* There is a beadle whose duty it is to look after the cleanliness of the little niche in which he stands, and upon fête and gala days he is decked out in one or other of his court dresses, for the amusement of the populace. With these associations attached to his history, we should have accused ourselves of disrespect to the town of Brussels itself if we had not, before leaving it, paid our humble homage to the Mannekin.

* Richard Duppas, Michael Angelo. See also Lessing.

HORTICULTURE.

BY MRS LYDIA H. SIGOURNEY.

If the admiration of the beautiful things of nature has a tendency to soften and refine character, the culture of them has a still more powerful and abiding influence. It takes the form of an affection; the seed which we have nursed, the tree of our planting, under whose shade we sit with delight, are to us as living, loving friends. In proportion to the care we have bestowed on them, is the warmth of our regard. They are also gentle and persuasive teachers of His goodness who causeth the sun to shine and the dew to distil; who forgets not the tender buried vine amid the ice and snows of winter, but bringeth forth the root, long hidden from the eye of man, into vernal splendour or autumnal fruitage.

The lessons learned among the works of nature are of peculiar value in the present age. The restlessness and din of the railway principles, which pervades its operations, and the spirit of accumulation, which threatens to corrode every generous sensibility, are modified by the sweet friendship of the quiet plants. The toil, the hurry, the speculation, the sudden reverses which mark our own time beyond any which have preceded it, render it particularly salutary for us to heed the admonition of our Saviour, and take instruction from the lilies of the field, those peaceful denizens of the bounty of Heaven.

Horticulture has been pronounced by medical men as salutary to health and to cheerfulness of spirit; and it would seem that this theory might be sustained, by the happy countenances of those who use it as a relaxation from the excitement of business or the exhaustion of study. And if he who devotes his leisure to the culture of the works of nature benefits himself—he who beautifies a garden for the eye of the community is surely a public benefactor. He instils into the bosom of the man of the world, with the gold fever, gentle thoughts, which do good like a medicine. He cheers the despondling invalid, and makes the eye of a child brighten with more intense happiness. He furnishes pure aliment for that taste which refines

* Belgium as She is. By H. R. Addison. Brussels and Leipsic, 1843.

character and multiplies simple pleasures. To those who earn their subsistence by labouring on his grounds, he stands in the light of a benefactor. The kind of industry which he promotes is favourable to simplicity and virtue. With one of the sweetest poets of our native land we may say—

> 'Praise to the sturdy spade,
> And patient plough, and shepherd's simple crook;
> And let the light mechanic's tool be hailed
> With honour, encasing, by the power
> Of long companionship, the labourer's hand,
> Cut off that hand, with all its world of nerves,
> From a too busy commerce with the heart.'

MISERIES OF A PUBLIC DINNER.

It seems to be a rule that the gentleman who first seizes upon the salt should keep it. It is upon the same principle that the party who sits opposite the turbot helps himself liberally to the fins, and having pitched a rude supply into one or two plates thrust over his shoulder by beseeching waiters, drops the fish slice, and can neither see nor hear appeals until he has finished his fins. Whosoever fixes his fork in a fowl becomes the proprietor of it, so far as wings, or breast, or all that he himself has a taste for is concerned. A slice of tongue is quite unattainable with your chicken—chicken and tongue *too* must always be considered unreasonable and romantic at a public dinner; but perhaps the desired slice is securable by itself. We make a trial; we send a plate, having little chance of seeing another—with an earnest, a pathetic appeal. That plate we never see again. With exemplary patience we wait its return; time passes on, and the dishes disappear: we have become accustomed to our hunger, and having some of the nicely-rasped roll left, we forget our application in applying ourselves to that. But at length the solid dishes have all melted away into a horrible mockery of custards and jellies! Even a wrong cut of the spoiled mutton is now irrecoverable. Grumio's 'beef without the mustard' we might have had—but may not now. The tough turkey has become an impossibility. The dinner, shockingly arranged, infamously selected, and iniquitously cooked—bad as it was—is gone! And now, remembering the almost longed-for, the all-but-necessary bit of tongue, we once more make trial with our own. 'I asked you twenty minutes ago for a slice of tongue—I have had nothing—never mind;' and ten minutes afterwards the slice actually comes. It is brought, set down before us, left there. Why, it must be tasted, then, late as it is. Its colour is inviting. Just as we have adopted so much of it as seemed fairly apportioned to the remaining fraction of the roll, we feel, rather than perceive, that somebody is looking at us; and there, directly opposite, is a huge gentleman, who, having necessarily occupied two seats, had come into the possession of two sets of plates, with a double supply of forks and etceteras, all of which he had contrived, greatly to our loss, to make incessant use of throughout the dinner; monopolising all godsends that came to our part of the table, and confining his whole attention to his own proceedings. And now, when he has performed his appointed task, when he has despatched all, when the very cheese charms him no longer, what is he to do but glance around him? And there, opposite, are we—we alone—eating tongue—tongue at that hour—when the cloth is rolled up, and the mahogany visible at the lower end of the table! His eyes are rivetted upon us. They reveal clearly, too clearly, all that is passing in his mind. He has not the smallest particle of a doubt that *so* we have been going on ever since the far-distant era of soup; that the fork has been in incessant employ ever since the spoon was laid down; that we have been dining, indeed, with a forty-dando power of perseverance! Imagine the position we are in. The tongue's rich redness is faint compared with the blush with which it is contemplated. The smile on our observer's face, his stare prolonged—they are not expressive of disgust at the supposed achievement of a never-to-be-discontinued dinner: no, they are expressive of *envy*. In one minute more, just as we finally lay down the fork with a portion of the untasted treasure upon it, the attention of half the table is attracted to the awkward incident, by his ejaculating in a very audible and emphatic whisper across the table, 'Waiter; here, waiter! bring *me* a small slice of tongue!—Waiter!—thickish!'—*Laman Blanchard's Sketches from Life.*

A MOTHER'S RESIGNATION.

> 'There are griefs that lie in the heart like treasures,
> Till Time has changed them to solemn pleasures.'

No, not forgotten! Though the wound has closed,
And seldom with thy name I trust my tongue,
My son! so early lost, and mourned so long;
The mother's breast where once thy head reposed
Still keeps thy image, sacred through long years,
An altar, hallowed once with many tears.

How oft my heart beats at some idle saying,
Some casual mention of that foreign land
Wherein thy grave was dug with hasty hand,
And thy sole requiem was thy mother's praying;
'Till o'er the ocean swift-winged memory flies,
To that lone forest where my first-born lies!

Sometimes, when in my other babes I trace
A momentary likeness unto thee—
Thy smile that ever shines in memory,
Thy thoughtful eyes, thy love-illumined face—
I clasp the wondering child unto my breast,
And fancy that my arms round *thee* are prest.

I think of thee, but 'tis with grief no longer;
I number thee among my children still;
Though parted in the flesh, by God's high will,
I feel my soul's deep love for thee grow stronger:
Like one of old, I glory to have given,
Out of my flock, an angel unto Heaven.

D. M. M.

FILTH AND FEVER.

Deficient drainage, if not the parent, is most certainly the nurse of fever. My own opinion is, that fever is a contagious disease, spreading from person to person just as small-pox or scarlet fever does; and, like those diseases, haunting over-crowded or ill-drained districts, and all places where, from any cause whatever, the air is foul, and filled with animal and vegetable exhalations. It loves the banks of rivers, the borders of marshes, the edges of stagnant pools. It makes itself a home in the neighbourhood of cesspools and badly-constructed drains, and takes special delight in the incense of gullyholes. It has a perfect horror of fresh air, soap, and whitewash; but when left to itself, will linger for years amid scenes of filth and corruption, and hold in its deadly embrace all human beings who have the same depraved taste, or are so unfortunate as to be thrown into its company. It is the favourite child of *laissez faire* (in plain English, let alone), and bears the same relation to filth that crime does to ignorance.—*Lectures by D. W. A. Gay.*

SAVAGE AND CIVILISED.

Stripped of all its fictitious ornaments, savage life, though it has natural beauties, yet the darker shadows of its vices overcome the lustre of its virtues; and though we may regret individual loss, we cannot but rejoice in the universal advantage and progress. The mill and the factory of the white man may be less picturesque than the deer-skin lodge of the red; the smoky steamer, as, panting and rattling, she cuts through the lakes or rivers, less in harmony with their features than the undulations of the buoyant canoe; the blackened clearing, less grateful to the eye than the woodland glade; the dusty road, than the forest trail; but the perfection to which they lead, the bright day of peace and love of which they are the harbingers—though but dimly discernible in the long perspective of years to come—is too pregnant with the happiness of the human race, and the glory of the Deity, to leave any serious pain, for the means by which it is of necessity to be obtained, upon the mind which looks forward to it.—*Rev. C. Nicolay.*

NOTICE.

No. 135. New Series. SATURDAY, AUGUST 1, 1846. Price 1½d.

BAKERS.

A few evenings ago, I was induced to attend, and finally to occupy the chair, at a public meeting in Edinburgh, called to consider the condition of the operative bakers of the town and neighbourhood. There was something so remarkable in the appearance of the assemblage, and so much occurred to interest the feelings, that I may be excused for drawing public attention to the subject.

It appears, from statements on the occasion, that the condition of this class of men has long been one of extreme discomfort, as well as of bodily and mental deterioration. Thrust into the business while boys, they may be said, from first to last, to lead a dog sort of life. They are usually boarded in the houses of their employers; and commencing work sometimes as early as three o'clock in the morning, they do not cease till five or six in the evening, if not later. On some occasions, particularly about Christmas, they labour as many as eighteen or twenty hours a-day. The only variation of their toil in the heated atmosphere of the bakehouse, is the duty of carrying out bread to customers, which, in all small establishments, is done on wooden boards poised on the head. I know of no spectacle in ordinary labour so much calculated to excite emotions of compassion, as that of a lad, of fourteen or fifteen years of age, staggering along under one of these heavy burdens. A natural consequence of this complication of in-door labour in a close heated atmosphere, and the out-door labour under head burdens, is a poor state of health, frequently attended by distortion of the limbs and body. The appearance of some of the individuals at the meeting spoke impressively of this physical deterioration, and was more convincing than the most eloquent appeals that there is something radically wrong in the system.

The moral evils, however, have always been more observable than the physical. Having little or no opportunity for improving the higher faculties of the mind, they grow up in ignorance, and with a predominance of the animal passions. Robert Fergusson, Edinburgh's own laureate, speaks of the uproarious doings of the 'baxter lads' of his time, and of the terror they inspired in the ancient military body composing the Town-Guard. They are certainly less now, than formerly, a trouble to the peaceably-disposed part of the community, having participated in the general improvement of manners; but, by their own melancholy confession, they form a less respected class than other tradesmen. Nor, in present circumstances, can it be materially otherwise. When they attempt to devote an hour in the evening to literary recreation, they drop asleep. Attendance on lectures—those useful engines of improvement in the humbler departments of society—is precluded to them. A clergyman present at the meeting took occasion to mention, that on many of this class of operatives he found it pretty nearly impossible to make any distinct impression in spiritual matters. They could not understand what was said: their intellectual faculties were seemingly in a state of dormancy: excessive and protracted daily toil had fallen like a blight on the soul. On Sundays, it was with great difficulty they could refrain from sinking into slumber during divine service.

Another serious ground of complaint is the method of remunerating them for their services. Instead of giving them a stated wage in money, it is customary to pay them partly in money and partly in kind. Their board and lodging is considered as worth so much. But such board—such lodging! One man, with a flow of natural and affecting eloquence, mentioned that 'he had lately been one of six, among whom there were only two beds, and these were placed in a dark closet, in which it was impossible to stand upright. There was no sitting apartment. The meals were taken in the bakehouse. Here he made an effort to read a book when the day's work was over, but the master would not permit the gas to be burnt; and as he did not like to sit in the dark, or immediately to go to bed, he spent a couple of hours walking about the street.' This was possibly an extreme case; yet there appears sufficient evidence to prove that the practice of boarding and lodging these men is exceedingly offensive and pernicious. At the very least, it throws an obstacle in the way of their marrying, and is consequently productive of much demoralisation. When a journeyman marries in the face of every impediment, he runs the greatest risk of being discharged: among his companions he is said 'to be done for;' it being a belief among masters that a married man will not scruple to steal in order to support his wife and family. What a revelation of the social condition of this class of workmen! If true, how deplorable that things should have come to such a pass that theft is presumed to be the only alternative of semi-starvation! One man at the meeting frankly owned that, 'when a lad, he could not have lived without the daily commission of this mean and detestable vice!'

Slow to believe sweeping condemnations of any body of tradesmen, I should imagine that those master bakers who persist in the practices avowedly so obnoxious, will plead the not unreasonable excuse, that they pay for assistance only in correspondence with the state of the labour market—that if great numbers of men will gladly take a small remuneration, it would be folly for them to give more. Supposing this to be the case, the foundation of the mischief would seem to be the overcrowding of boys into the business, producing an undue competition of hands; in short, there are too many operatives in proportion to the number of masters, and wages are

accordingly kept down. Acknowledging the practical application, in the present instance, of this sound maxim in political economy, I would at the same time submit, that the conduct complained of aggravates the evil, and reacts on employers. The sufferings of the journeymen dispose them to embrace the earliest opportunity of going into business on their own account, and thus the trade is greatly overdone and deteriorated. This was clearly made out at the meeting, from the statements of individuals who had formerly been operatives; and it is only another proof that every transgression carries in it the elements of its own punishment.

It was gratifying to learn that it is only a portion of the trade whose arrangements are open to complaint. All respectable bakers appoint regular and not too protracted hours of daily labour, pay a money wage, and permit the men to live where and how they please. This fact verifies another maxim, the force of which has been too long in being acknowledged—that it is not capital, but *poverty* which is the real tyrant of labour. The monied man, conducting a large business, can afford to be liberal; he can safely, and in a manner gratifying to his feelings, grant indulgences to those in his employment which the man in struggling circumstances dare not aim at. Heaven pity the servant of a poor man! the rich man's servant needs no pity.

This brings me to the consideration of what may be done to remedy the grievances complained of. It seemed to be the feeling of the meeting that the only cure would consist in the public dealing exclusively with persons who were known to treat their men with justice and humanity. I will not say that this might not have some effect; but, on general grounds, I would deprecate bringing the principle of exclusive dealing into operation. Besides, viewing the matter coolly, the public cannot be brought, by appeals to feeling, to deal with any one man in preference to another. We must look this fact in the face, that no housewife has any other thought in buying her loaves than where she can get them best and cheapest. Overlooking what may be done by fewer hands pressing, or being pressed into the profession, and also passing over what may be effected by a mere expression of public sympathy, I can see no other rational basis for a regeneration of the baking trade than this: To mend the thing rightly, capital must bring forward her Herculean resources. The baking of bread has all along been conducted in large towns on too narrow a scale. Even the greater number of the largest concerns are too small. The living of too many families is taken out of the sale of a comparatively trifling quantity of material. The object should be to give the public bread at the smallest possible advance on the cost of the grain—not by screwing down poor lads to a miserable pittance of wages, but by the application of capital; in a word, introducing the factory principle into the trade.

It is at present customary for the bakers of London to buy flour from millers; the millers buy from grain-dealers; and the grain-dealers buy from the growers. What an accumulation of profits, all laid ultimately on the price of bread! In Edinburgh, the bakers buy directly from the growers or importers; but as they pay for grinding, and impart a profit to sub-sellers, they stand pretty much on the same footing. Should not all this clumsy process be remodelled? Should not the maker of the bread in all cases buy directly from the grower, be his own miller, and also, as far as possible, his own retailer? 'Impossible! It is much too complicated a trade to prevent the conjunction of so many departments!' Is this assumption quite certain?

In the course of April I had occasion to be in Carlisle, and to spend a forenoon very pleasantly in going over what, I believe, is one of the largest baking establishments in the world. This bread and biscuit factory, as I may call it, was commenced a number of years ago; and from small beginnings, has risen, under the enlightened management of its proprietor, J. D. Carr, to its present huge dimensions. It consists of a cluster of substantial structures, built of the red sandstone of the district, and surrounding a quadrangular courtyard. On entering, we are first shown the source of all the mechanical movements in the concern. This is a low-pressure steam-engine of fifty-horse power—a very fine piece of mechanism; and not less so is the furnace and boiler apparatus; for by an ingenious, yet simple arrangement, the fire feeds and clears itself; in fact, the whole affair seems to go on as steadily, and with as little attention, as a wheel impelled by ordinary water power. The principal duty of the steam-engine is to move the mill, which it closely adjoins. Here, likewise, there are some ingenious economical arrangements. A mill, as is well known, consists of two circular stones; the upper, which is moveable, playing round on the lower, which is fixed. It usually happens that, after working for a few hours, the stones become heated by the constant friction; this heat is communicated to the grain, and raises from it a certain steam or moisture; and the moistened material adhering to the stones, lessens the friction, and causes the mill to be stopped. Heating alone, without raising a moisture, is almost equally detrimental; and any way, ordinary grinding is imperfect where there is a great deal to be done. No plan has proved so effectual for remedying this defect as one—the subject of a patent—which I saw in this establishment. From a small fanner-like apparatus, moved by a belt from the engine, a stream of cold air is conducted in tubes to the interval between the stones (the admission being by orifices which perforate the lower stone); and by this simple and perfectly inexpensive arrangement the apparatus is kept always cool and workable. The mill may go incessantly for twelve months, and yet it will be in as good order at the end as at the beginning. Mr Carr told me that, by this contrivance alone, he could grind his materials at a shilling a bag lower than any miller using a common apparatus is fit to do. He employs four sets of stones, and the quantity of wheat ground by him annually produces 157,000 stones of flour, or about 8000 bags, all of which are baked into bread and biscuits within the premises.

The flour, on being ground, is carried by a connecting apparatus to the sifters or dressers, and thence, without being from first to last touched by hands, is lifted, in an endless chain of buckets, to the floors above. It is now transferred to the bakehouses, which we next enter. The first suite is devoted to bread, the next to biscuits—there being in all thirteen ovens; but at the time of my visit several more ovens were building, besides some other additions. The ovens are formed of stones of great thickness, in order to retain an equable heat; and one great beauty of all the bread and biscuit turned out is, that from one year's end to the other every article is of a uniform gentle brown tinge. Among ten thousand loaves, you could not detect the slightest difference of one from another. The bread is prepared by men; but the biscuit is kneaded, rolled into sheets, and stamped into form by machinery. The biscuits are of two shapes—round, and small oblongs. The round ones are stamped by cylinders, under which the sheets of dough pass; but the small oblong fancy kind are impressed by platens, as in printing with hand-presses. The quantity of biscuits regularly made is eight stones per minute, or four hundred tons annually. The spectacle of so much automatic and human industry is exceedingly pleasing, and the more so from the junior operatives being clothed in pure white linen jackets and aprons, and all apparently healthy and happy little fellows.

The next place we are conducted into in this remarkable establishment is the packing-room, where men and boys are putting up tin cases of biscuits for exportation to all quarters at home and abroad. Below is the large retail shop of the concern. Having walked through this, I was led into a department which no baker with ordinary resources could be expected to organise. I allude to the means adopted by Mr Carr for the comfort and welfare of those in his employment. Not to dwell minutely on particulars, I was shown in succession a

reading-room, a library, and a school-room, all appropriately fitted up, and in daily use by old and young. The boys, besides, attend on Sunday for spiritual instruction in the benevolent proprietor's mansion, a villa situated in the environs of the town. Among other improvements contemplated, and nearly ready, was a bath of fourteen feet square, which is to be supplied with a constant flow of pure water from the steam-engine, at a temperature of ninety degrees. The quantity of water (which has been hitherto lost) is eighty gallons per minute; and as this is much more than is required, I should hope that means will be adopted for diverting the overplus to baths for the use of the poor.

The number of persons employed in the establishment at the time of my visit was between eighty and ninety. The period of labour is from a quarter past five in the morning till six in the evening; and, deducting intervals for meals, it amounts to eleven hours daily. All are paid in money wages—boys 3s. to 5s., and men 17s. The boys have further an allowance of biscuits as a gratuity daily. In answer to a question respecting the character and habits of the men, I was informed that there is not a more orderly or respectable body of individuals in Carlisle; and so marked is this, that landlords are generally anxious to have them as tenants.

Such, then, is a fair sample of what may be done by an enterprising capitalist to manufacture bread on a great wholesale plan, at the smallest advance on the market price of grain, and also to place the operatives on a comfortable and respectable footing. I am not aware that, from the establishment I speak of, bread is sold at a rate lower than that of the trade generally; nor can it be expected that such should be the case, as long as prices are regulated by the cost of inferior modes of working. It is only by general competition that the factory principle can materially benefit the public, however much otherwise it would be to the advantage of employer and employed. At all events, it seems conclusive that a fundamental cause of an unnecessarily high price of bread (other things being equal), as well as of the degradation of the individuals who prepare this useful article of consumption, is the breaking up of the profession into a vast number of small concerns, conducted on ineconomic principles, instead of being confined to capitalists possessing the power to act with a becoming and comprehensive liberality. Avoiding hurried and crude changes, I would hope that the manufacture of bread will, in the hands of respectable bakers, gradually assume this desirable character.

June 8, 1846. W. C.

THE WHIP AND THE WISH, OR THE TWO ESTATES.

BY PERCY B. ST JOHN.

Negro slavery in the United States presents, in the present day, many features abhorrent to humanity. Still—the institution apart—it is, with rare exceptions, the mildest form of this terrible scourge of the coloured race. It has grown milder with the increase of knowledge and the spread of information, and when extinguished, will have been so much more by the gentle arts of reason and persuasion, than by the abuse and violence which was formerly lavished against it. Man is a creature to be won from error, not to be driven into virtue. In former days, however, nothing could surpass the dreadful nature of this evil. In no part of the United States was slavery more abused than in the Carolinas, North and South, especially the latter. Peopled from Virginia and Pennsylvania, by not the most industrious and praiseworthy, because of the unsettled and roaming part of the population, many held estates who were not very deserving of the position they enjoyed. The scene of our narrative is laid in South Carolina, between the years 1774 and 1780, or at the date of the great struggle between Whig and Tory, or British and colonial interests.

Between the two estates of Colonel Melville and Major Thornton was what is called a pine-barren; and here, one summer evening, were congregated one of those motley assemblages to be found only in perfection on the spot now described by us, and known as Four Holes. There were hunters and trappers in their rude costumes; there were farmers, English and German; overseers; that numerous class known as loafers; and no small sprinkling of negroes, old and young, who of course kept very far apart from the rest of the congregation, though perhaps more deeply interested in the result of the deliberation than any of the others. It was a stump-meeting, assembled to hear the address of a stump-orator. The speaker was a tall, thin man, gaunt in features, with sallow cheeks and long black hair, which, added to his manifest earnestness, made no small impression on his auditors. Few, however, sympathised with him, for he was a Tory or British orator, striving to stir up the fading loyalty of the people of South Carolina. His address, which was long, and plentifully interlarded with Scripture quotations, was listened to, however, with much respect; and when he concluded, and, mounting his horse, rode away, after naming a place where recruits to the cause could find leaders, many were half-tempted to follow his advice.

The whole of the assemblage had dispersed, when two old negroes met at the spot where the path diverged to the estates of their respective masters, and had a conversation, in their own broken language, on the subject in hand. The sentiments of the two negroes, Methuselah and Jacob, were at variance, from very natural causes. Colonel Melville, the master of old Jacob, was a gallant and noble-minded fellow, who, leaving Virginia from mere love of change, had settled with his family in the neighbourhood of Four Holes, South Carolina. Having a magnificent estate, it was his pride that he should leave it to his only daughter in such an improved condition as to bear comparison with any in the vicinity. This daughter, named Julia, was a very powerful instrument in working out his plans. A lively, good-natured, kind-hearted girl, full of the spirits and enthusiasm of youth, she allowed a great deal of this enthusiasm to lavish itself upon the negroes, of which her father owned a very large number. In this feeling Colonel Melville strongly coincided, and at an early age had commenced a course of treatment which met with its reward. The negroes were taught to love and respect their master, because he attended with watchful care to their comforts; never overworked them; appointed them tasks suited to their age and sex; and invariably issued his commands in the form of a request. 'Old Jacob,' he would say, 'I wish you would leave the corn-field to-day and mend the fences.' By degrees even the very word flogging became unknown on his estate; and yet he never found that there was any less work done, or that he suffered in pocket by the substitution of kindness for compulsion.

Major Thornton had inherited an estate and its accompanying negroes also at an early age; but his disposition was very different. Rude pleasures—hunting, shooting, horse-racing, drinking, the common vice of rich planters in that age—so absorbed his attention, that his slaves were wholly left to the mercy of the overseers. With them the whip was a tradition; they reverenced it as a relic, and could believe in no other panacea against laziness. If a negro was ten minutes late in bed, he was flogged; if he appeared in the corn-field behind his time, he was flogged; and in all other cases the same. The result was not so satisfactory as they might have wished. Beat into work, the degraded slaves did only what they were forced to do—they laboured while the lash was over them; but no sooner was the terrible instrument out of sight, than the negro seated himself, or leaned against a tree in obstinate idleness. With, therefore, loss of time, constant illness of the men, and runaways, the affairs of Major Thornton did not prosper, as, according to the overseers, they ought to have done. And yet these worthies, when

the conduct of Colonel Melville came under discussion, would shake their heads, and prognosticate some terrible retribution on the head of him who had thrown aside the tradition of the lash, which, in their eyes, was venerable and sacred.

It was some days after the meeting on the pine-barren, and old Jacob was standing beneath the shelter of the piazza which ran in front of the whole of Colonel Melville's house. The sun was setting in its full tide of evening glory, shedding a glow over the whole scene, when the clatter of horse's footsteps were heard hurrying rapidly in the direction of the 'Retreat,' as it was called.

'Somethin' of 'portance,' thought old Jacob, 'make a man hurry hese'f in dat bay. I 'spect he no spare 'um hoss.'

The cavalier came in sight at the moment. He was a young man of rather agreeable mien, clothed in something of a military costume, while sword, carabine, and pistols, strengthened the impression that he was a soldier. Pausing only when he reached the piazza, the young man hastily inquired for the master of the house, and giving no time to Jacob for reply, dismounted, and followed the negro into the parlour; not, however, before the sound of other horses was heard coming in the same direction. Mr and Miss Melville were seated at an evening meal, of which coffee, venison, rice niffles, and various varieties of Indian corn cookery, formed the staple.

'Sir,' said the stranger, entering abruptly, 'I am a fugitive, flying for my life from a gang of Tories, who have vowed my instant death because I am myself known as a Whig officer of rank.'

There was something so manly in the young man's address, his manner betraying no slavish fear, but an honest love of life, that father and daughter were at once prepossessed in his favour. The former turned towards Jacob, and bade him instantly summon every male on the estate to arms; and then pointing to a door, intimated to the colonial officer that he might by that ascend to a loft, where he could remain concealed until he came to relieve him. The young man gracefully bowed his thanks, and obeyed. A few minutes elapsed, during which Colonel Melville found time to give instructions to his head overseer, and then up rode the party in pursuit. Under pretence of taking one side or another, sometimes wearing British, at other times colonial colours, gangs of desperadoes overran the country at this period, plundering and committing the most frightful excesses. It was one of these, commanded by one Colonel Diprose, which halted, to the number of twenty horsemen, in front of the 'Retreat.' Surrounding the house, and guarding every avenue, the chief was then shown into the principal apartment of the house.

'Sorry to disturb you, Colonel Melville, said the Tory, 'but General Thornton of the Colonials has taken refuge in your house, and it is my duty to arrest him.'

'I was not aware of the honour,' replied Colonel Melville, somewhat surprised; 'but if General Thornton be in my house, he is welcome to its hospitality.'

'Colonel,' said Diprose sternly, 'I should be sorry to proceed to extremities; but if I burn this house down about your ears, this rebel must be found.'

At this instant one of the subordinates entered, and whispered to the captain. 'We have fallen upon evil dogs,' he said; 'a hundred armed negroes, with some dozen whites at their head, are round the house. They seem determined fellows.'

The Tory chief bit his lip, and then, after a pause, turned towards the master of the 'Retreat.' 'Sir, I perceive you are prepared to resist my authority: your force overpowers mine; but rest assured I leave not this neighbourhood until the general be found.' With these words the discomfited trooper left the room, and mounting his horse, headed his band once more, crying, 'To Squire Thornton's. The father shall pay for the son.'

A few minutes later, the young colonial general was seated between his kind hosts. He now explained that, having been from home for many years, studying at college until the troubles, he was desirous at length of paying a visit to his father, whom he had not seen for so long a time as almost to have forgotten him. On his way, he had been recognised by one of the spies belonging to Diprose's gang, who, looking upon him as an important capture, had chased him for two successive days through the forest. A conference was held, and it was resolved that Major Thornton should be informed of his son's presence, the difficult part of the matter being to decide how.

Meanwhile the baffled troopers journeyed towards the house of Squire Thornton. Their progress was rapid, as the night was drawing in, and half an hour brought them to the mansion of the major. The negroes, save the household servants, were gone to bed in their sheds, where they were locked up for the night, dogs being also set to prevent the chance of their leaving their prison. The overseers slept near at hand, armed to the teeth, while not even a stick was trusted in the hands of the negroes. Colonel Diprose found the major just about to sit down to supper, and, with his chief men, was instantly invited to join him. The Tories complied; and having posted sentries round the house, and seen to their horses, entered, and sat down to the meal with the squire. As usual, wine and the local spirits—rum and whisky—were in abundance; and to these the troopers did even more justice than to the viands. At length they affected Diprose to a degree which increased his natural ferocity. Calling for one of the negro household servants, Methuselah appeared.

'Black skin!' he said, 'go over to Colonel Melville's, and tell him, that if General Thornton aint in our hands before midnight, I will burn his father's house about his ears, and set the negroes free.'

'I am not a guine to gib any sich aggrabating message,' muttered 'Tuselah to himself as he left the room, and retired to the kitchen.

As for Squire Thornton, he had pledged his guests too deeply and too often to be able to have any very distinct understanding of what was passing around him. Still, the infatuated man continued to drink, while his companions, nothing loath, followed his example. We shall pass over the scene which occurred until within half an hour of midnight. At that hour Colonel Diprose, holding in his hand a lantern, and followed by the whole of his gang, issued into the courtyard of the house, and advancing towards the huts of the overseers, awoke these individuals, and bade them go and attend to their master. No sooner were the startled men within the passage, than Diprose entered the door, and turned to the negro sheds, guided by the veracious Methuselah, who had brought some pretended message from the 'Retreat.' In a moment they were open, and the startled slaves heard a voice crying, 'Star up ebery man ob you; you bin free.'

Up rose the negroes with one accord, and poured forth into the open air. Their first act then was to make sure of the arms of the overseers, and any other articles which they could turn into offensive weapons. They then crowded round Methuselah, who (Diprose having retired with his men to the skirt of the forest) alone remained to direct them. Assuming much of the air and manner of the stump-orator of the pine-barren, the old negro addressed his companions. 'I tell you, coloured people, dat you be free; free ob massa, free ob obersheer. Dat's 'um fact. Well, I 'spect you remain so. But free not enough. Do you forget him stripes? Why a nigger suffer white man beat him? His skin smood like anothers man. We'll see if de white man like him hickory-stick!'

He then directed the inmates of the house to be seized, and brought before him. With a loud yell the negroes burst into the house, and soon reappeared, dragging each his victim. Abject and terrified indeed was the aspect of the major and his servants. He would have spoken,

but the voice of Methuselah interrupted him. 'Um too dark to see him white man face. Bu'n 'um house.'

'Fiends! devils!' cried the master, struggling in the grasp of two powerful negroes, 'spare my home. What is it you seek? What want you?'

'Revenge!' said the cracked and cold voice of the old slave. 'Nigger want revenge for blow. Master slave now.'

The order to fire the mansion was one too gratifying to the excited feelings of the slaves, upon whose minds rushed all the memories of years of toil, and suffering, and cruelty, not to be obeyed with fearful alacrity. Wood, straw, combustibles of every kind, were piled around and within the passage, and then a dozen torches were hastily thrown upon the whole. The house, all of wood, took instant fire, and soon a fierce blaze, illumining earth and sky, fields and forest, proclaimed the terrible revenge of the negroes. The miserable gang who had caused the outrage gave a loud cheer as they saw the result of their handiwork, and the wretched major saw at once how the whole had happened. The negroes acted with calmness and precision as soon as the vast conflagration gave them the means of seeing clearly what they were about. Some employed themselves in tying the overseers to posts and logs, in convenient postures for inflicting the retribution they meditated; others sought in the outhouses the whips and thongs which erst had scarified their own backs; while, in the background, dusky forms of women and children were seen gazing, half in terror, on a scene, to them, so new and startling. Still further in the rear were the Tories, waiting only the finale of this event to start upon some other errand of blood. At length all was ready; and Mr Thornton being reserved for the last, the negroes, having so placed him that he could clearly distinguish the punishment of his subordinates, began. Never had slavish voice yelled forth such cries of anguish and pain, as those who so often had callously inflicted the same torture now gave vent to. They shrieked, they intreated, they prayed; but all in vain: the full measure of one hundred lashes was meted out to each of them. This done, they were unfastened, and cast on the ground in agonies they could now understand.

'Now him massa turn,' said 'Tuselah with a savage laugh; 'and gib him two hundred.'

'Hold! down with your arms!' cried the clear voice of Colonel Melville.

Methuselah and his gang turned. Around them, occupying every outlet, so that no hope of escape was left, stood the armed negroes of the colonel, with some two or three dozen white men, attracted from neighbouring farms by the blaze. In custody of these were the Tories. General Thornton sprang into the midst, loosened his father, and bore him from the fierce glare of the burning house, while old Jacob and his faithful followers disarmed the now trembling slaves of the major. 'What needcessity of all dis?' said old Jacob. 'He will dead for dis. It all dat stump chap, I 'spect. Berry glad as Jacob no sich ole fool!'

It was too late to save the house, though the fire was easily prevented from reaching the outhouses. This done, the whole cavalcade returned to the 'Retreat,' where Julia welcomed both her father and the handsome general, in whose fate she had taken a marvellous and sudden interest, especially since she found he was to be a neighbour. Old Thornton was put to bed, from which it soon became evident he was never to rise. The shock was too much for a frame enfeebled by indulgence; and General Thornton found that he had come in time. The major was conscious of his end, and early the next morning summoned his son and his hosts to his bedside.

'Neighbour,' said he, 'how is this? My negroes have revolted and murdered me, though I had an armed force to keep them down, while you put arms in the hands of your slaves, and they serve you as a protection.'

Colonel Melville hesitated; but the dying man insisted on a reply.

'Neighbour,' he said, 'I have treated my slaves with uniform kindness and firmness. They love me, and would give their lives for me.'

'I see,' replied Thornton; 'there has been a great mistake somewhere. I have tried the whip, you the wish. I fancy, neighbour, yours is the true method. Colonel Melville,' said he, suddenly half-rising in the bed, 'you must take my fellows in hand, and see what you can make of them.'

'General Thornton will, I am sure, do his duty.'

'I don't know that; he is my son. You, however, have a daughter there; if she——'

'Father, not now,' said the young man, colouring deeply. 'Speak not of such things now. It is unkind to our host.'

'Major Thornton,' said the colonel solemnly, 'the wishes of a dying man weigh strong with me; and if, a year hence, your son and my daughter find no reason to quarrel with your desire, they shall manage our two estates in one.'

The misguided man, whose thoughtlessness and vice had brought its fearful punishment, sank back with a smile of relief, and in a few hours expired. The same day the Tories were handed over to the authorities, accused of burning and instigating to murder; for which they were severely punished. The negroes were, at the earnest request of their master, just before he died, pardoned; and thus, for the time, ends our narrative of the WHIP AND THE WISH.

At the expiration of a year, General Thornton and Julia Melville were married; and never did they forget the tragedy which chiefly tended to bring about their union. One of their most earnest wishes ever was, to teach their children that kindness, gentleness, the arts of persuasion and of love, are ten times more efficacious than violence or the sword; and that human nature, white and black, is much easier, and more profitably, led by the WISH than driven by the WHIP.

PROGRESS OF INTEMPERANCE IN INDIA.

BY LEITCH RITCHIE.

IT would give me great pleasure to be able to introduce the people of India to the people of England. They are at present utter strangers; and this should not be the case between two classes of the subjects of the same empire, who are only at a distance of between three and four weeks from each other. I do not mean that the English of our day underrate the Indians, or treat them with indifference or contempt. They are far too generous for that. They respect and pity them; they are willing to love them as brethren, if they could come to know them better. But all these sentiments, being founded on false data, do more harm than good, tending to retard rather than advance the progress of the objects of their chivalrous sympathy.

The notion is hardly yet extinct in this country, that the British overthrew the Indian empire, and seated themselves on the throne of the Great Mogul! They could no more have done that than they could have stormed the moon. The elements of distraction were within the empire; they did not come from without. The Mogul dominion was already in fragments before the British appeared upon the scene; the great provincial officers had made themselves independent by means of their standing troops, and were at war with the state and among themselves; and it was in the character of allies and partisans that the adventurous traders of the west made their first essay in arms.

At this period the people of India had no political existence. The country was traversed from end to end by armies that were only banditti on a larger scale, and whose chiefs, generally speaking, had raised themselves from meanness and obscurity by their crimes. The people, on their approach, fled from their homes to hide themselves in the jungle; and when the torrent had swept past, returned to rebuild their sheds among the

ruins they found, and cultivate anew their devastated fields. It was with the rebel chiefs the English fought and treated, the myriads of the people being like ants beneath their feet; and when circumstances had led or forced them into a throne which was vacant of all but the shadow of a king, it is not wonderful that their delusion continued; that they counted the banditti as the nation, and the people as—nothing.

But this delusion could not continue within their own territory; for though frequently said, it is altogether untrue, that the English had no desire for the advancement in civilisation and prosperity of that country they had made their own. No sooner were they firmly settled in their territorial acquisitions, than the people began to appear above the soil, and their rights to be examined and understood. It is true a thousand errors were of necessity committed by conquerors ignorant of the language and character of their new subjects, and only gradually throwing off the allegiance they had undertaken to the shadowy empire or one of its high officers—the Dewan of Bengal. But the patient and laborious efforts they made to arrive at true theories of education, law, police, and revenue, are on record; and it is not less strange than true, that the grand hindrance they found was in their own fantastic respect for a régime that had passed away. They would rule the Mohammedans by their own law, under which the dominion had fallen in pieces by its intestine dissensions; and going back beyond the Mohammedan conquest, they would deal justice to the Hindoos under a system which had led to a national fall as contemptible and coward-like as any that is mentioned in history. 'We are the successors of the Moguls,' said they, 'and we must therefore govern like them; we are likewise the successors of the Hindoo princes, a couple of centuries earlier, and we must therefore rule as nearly as possible according to the system of Menu.' But it was vain for them to struggle against that destiny of which they were the blind and unconscious agents. The kingdom was not given to them for the purpose of building up anew a régime under which a great people had remained, not merely without progress, but in a state of active decline, from a period much earlier than the epoch of Alexander the Great. The fulness of time was now come, and India was to submit to the fate of the ancient nations of the west—to be broken in pieces both morally and politically, and new and nobler forms constructed from the fragments.

But while the English were, year after year, introducing into their own territories a closer and closer approximation to the rights of Europe, the fatal delusion went on which had governed from the first their transactions with the banditti around them. They could recognise the people among themselves; but, with a true insanity, refused to believe in their existence elsewhere. The chief and his robber troops were with them all in all; and even when they beat them in battle, they legalised their spoliations by treaty. It was the custom of the Mogul invaders to give up some towns to pillage, even when no resistance had been made, as a right belonging to the army; and in like manner it was, and is, a part of the coronation ceremony of the Mahratta princes to order a few shops in the town to be robbed. But these transactions may be reckoned, in the one case, 'the fortune of war;' and in the other, merely a little peculiarity of taste, characteristic of a rude and despotic government. The annual excursions, however, of the Mahratta armies in the amusement of *kingdom-taking*, are more to the present purpose. Just before the Pindarrie war, in 1817, one of Sindia's generals, for instance, was still luckier than usual; for setting out from Gwalior, according to custom, when the religious festival of the Duseyra was over, he captured, successively, *seven* districts of seven different states, yielding, collectively, twenty-one lacs and a half of rupees in the year. Now the English were, by this time, the lords paramount of India, and the Pindarrie war was undertaken by them, it may be said, as the police of the country—the Pindarries being simply robbers on a great scale, without the territorial possessions which constitute robbers princes. The war ended in the extermination of the Pindarries, and in a treaty with the Mahrattas, in which the latter were guaranteed and confirmed in the kingdoms they had 'taken!' This forbearance, moderation, and magnanimity, were applauded by the English at home, just as they applaud to-day the same qualities which have given up, for a few months longer, a fine country, with a peaceful and industrious population, to the brutal ravages of the Sikh soldiery.

But all this stubbornness, abetted as it is by the unreflecting generosity of the people of England, although it must of course retard the progress of the Indians, can no longer stop it. The revolution has commenced, and no human power can permanently arrest its course. We have no enemies in India but the princes and their robber armies, from whom, at every new convulsion, the people fly in crowds for refuge to our peaceful dominion. The Hindoo mind is in a very interesting state of transition, of which I may, by and by, give some account; and although the change has of course commenced among the upper classes of the great towns, it is obviously spreading, however slowly, throughout the country. This, however, applies exclusively to our own territory. In the native states—that is, the states governed by native princes—the people are in a *worse* position than when under the Mohammedan dominion. Formerly, even the most brutal of their tyrants stood in some sort of awe of public opinion; but now, thanks to the alliance of the British, they are emancipated from all control! It is with *them* we have made treaties; it is at *their* command we have placed our troops; and the people, trampled to the dust by Christian and heathen alike, are without hope.

The transition state of the Hindoos, to which I have alluded, does not appear to receive from government the nicety of attention it requires. It is excellent to liberate the mind from prejudice, and relax the fetters of caste; but the individual at so exciting a time is in great danger. The fact appears to be, that in India, as the people become enlightened, they become intemperate; the government, so beneficent in one respect, actually furnishes the means for drunkenness. This is done just as church-going is encouraged by the building of churches, and a taste for theatrical amusements disseminated by the opening of new theatres. In India, the licensing system has flooded the heretofore sober country with *grog-shops*; and now, in the Deccan, even the Brahmins drink; though taking care, from regard for their religious character, to offer the unholy potation in the first place to the goddess Danee! The mischief has attracted the attention of the native press; and perhaps few Englishmen will be able to read without shame the following remonstrance, in a letter addressed by a Hindoo to one of the vernacular journals called the Dnyanodayu:—'Why does not the government consider whether it will always be able to fill its coffers by such means as this? It may be assured that, by allowing the sale of intoxicating drinks to go on without restraint, the Ryots are by degrees reduced to a miserable condition, and rendered unfit for any useful business. And when they shall be reduced to the lowest state of wretchedness and degradation, then whence will the government obtain the necessary revenue? Was there ever a religion known that rendered it the duty of the people to use intoxicating drinks? Surely no such precept can anywhere be found? And if it be not absolutely the duty of people to drink, then let the government consider how much loss arises from the use of these drinks, and whether it should not anxiously seek wholly to prevent such a practice. Besides, this is not a solitary evil. It always comes accompanied with a crowd of relatives. These are licentiousness, gambling, theft, strife, &c. But why should I enumerate? Intoxicating drinks are like a destructive river, on which float poverty, wretchedness, and the whole catalogue of crimes. If this river of death be allowed, without re-

straint, to flow over the land, then alas for the best interests of the people! And the government will, in the end, learn to its sorrow that there is neither glory nor profit in reigning over a nation of drunkards.'

This writer speaks more especially of the extensive country of the Peshwar—that nominal prime minister, but real king of the Mahrattas, whom we very properly dethroned, annexing his dominions to our own. He states that, during the rule of the Peshwar, intoxicating drinks were allowed to be sold only in one or two places, which were never frequented by persons who had any regard for their reputation; whereas, under the enlightened dominion of the British, grog-shops not merely flaunt themselves in the great streets, but skulk in the lanes and in solitary places, so as to be sure of victims from every class of society.

'But do you think,' adds the Hindoo, 'the government of the Peshwar did not know that a great revenue might be gained by licensing numerous grog-shops? It knew this very well; but it could not in anyway lend its countenance to such an evil business. It had some compassion upon the people. The English government, on the contrary, is like those animals which devour their offspring, or like those unnatural parents who, for a paltry sum, sell their own children. The government ought to regard the people as its children, and watch over their interests with the greatest care; but on this matter it bestows not the least consideration. In the spirit of utter selfishness, it seeks only to fill its own coffers.' Intemperance, I am sorry to add, thus fostered by the British, is rapidly increasing not only in the Deccan, but in all the great cities of India.

Now, what I wish to point out, using the above as an illustration, is the inconsistence of the people of England in their treatment of the people of India. Whether by active or passive agency, whether by fair means or foul, the East India Company holds at this moment for the crown nearly the whole of a great country, separated by geographical features which it is impossible to mistake from the rest of the world. The exceptions are native states here and there, belonging for the most part to the bandit chiefs I have mentioned, in which the people have no political existence whatever, but are trodden down by the army to a level with the beasts of burthen. Is the voice of the free and noble-minded people of England raised in behalf of these unhappy slaves of the soil? No. They throw the weight of their influence into the opposite scale; they league themselves with the oppressors, and insist that the subjects shall remain for ever excluded from that law of progress which rules the world under its new dispensation. They look on with absolute unconcern at the perpetual torrents of blood and tears which inundate those countries, of which we are, by our position, the guardians and lords paramount; and if a finger is raised against the frightful régime, their sympathies are immediately up in arms in favour of the despot, whom their blind and ignorant generosity confounds with the people.

Can I persuade them to turn these generous but mistaken sympathies into a new and legitimate channel? We have *begun* to treat with justice and kindness in many respects our Indian fellow-subjects; but, from an unhappy want of discrimination in an important particular, we are neutralising with one hand the benefits we confer with the other. We have introduced—neither from avarice nor wantonness, but from sheer want of reflection—among a habitually sober people, the licensing system of England, and are thus converting them, by wholesale, into a nation of drunkards. Why *offer* the Indians a poison they do not *ask*? The offer is only too readily accepted by the Mohammedans, who are a dissipated and reckless set of men; but the Hindoo requires (and finds!) long-continued temptation before yielding. Even in the army, the gentle, light-hearted, but gallant sepoy, exposed as he is to the corruption of evil communication, is not *yet* a drunkard. Even at regimental revels he usually abstains from the Circean cup; and it is not uncommon for his European comrade to exact a promise beforehand that he will *carry him home*—a task which is gravely and tenderly executed by the simple Hindoo.

For the sake of all that is good and great, let us save this interesting people, or at least defer tempting them to debauchery till they have received enough of the enlightenment of the west to protect themselves if they choose! Compared with us, for all their ancient parentage, they are a nation of children; and to establish grog-shops among them, is as bad as to plant stalls of poisoned cakes by the door of an infant school. We are fast abandoning the folly of attempting to rule them by the laws of their ancient princes; but let us at least hold by the policy of the Peshwar, in circumscribing the sale of intoxicating drinks.

RECOVERY OF THE ESTATES OF THE OFFLEYS OF NORTON.

A SMALL volume, under nearly this title, by the Rev. Joseph Hunter, of the Record Office,* gives an accurate account of a domestic incident, which the author of *Tremaine* has presented, with fictitious embellishments, in a work called 'Illustrations of Human Life.' There is not much in the real story—certainly nothing like the materials of a romance; yet we venture on a brief view of its main particulars, in the belief that these will be perused with some interest. It may be premised that Mr Hunter's aim is solely to show how far the popular novelist has consulted truth, and to prevent the truth of the case from being lost sight of.

In the middle of the last century, the estate of Norton, a few miles from Sheffield, was the property of a gentleman named Offley, a Whig and nonconformist. At his death, in 1751, he left a son, Edmund, and two daughters, all under age—the son being only eighteen and a half years old. To this youth the estates were bequeathed. Edmund Offley had been brought up at the best dissenting schools, passing some time at one in Northampton, which was under the charge of Dr Doddridge. He appears to have been a youth of somewhat weak character, though not to such an extent as to prevent his making a passable appearance in society. It was then customary for the English dissenters of the higher classes to send their sons to be educated at the Scottish universities, there being of course no admittance for them at Oxford or Cambridge, while academical institutions of their own were yet wanting. Accordingly, it was determined by his guardians that Edmund Offley should go with a tutor to Edinburgh. The person selected for this duty was a Mr Reed, a clergyman of the established church; in which respect there can be no doubt that the wishes of the young man's father were departed from.

Young Offley made a tour in the Highlands, in the course of which he was entertained by the Duke of Argyle at Inverary. Then he settled in Edinburgh. He soon tired of his tutor, whom he represented, in his letters, as a person of rude manners. How far Mr Reed had only offended by his conscientiousness in correcting his pupil, cannot be ascertained; but in a short time he became extremely distasteful to Mr Offley, who intreated his guardians for another in his place, but without effect. At this juncture the young man became acquainted with an English clergyman named Carr, who had been settled for some years in Edinburgh as pastor of an Episcopal congregation (unconnected with the Scottish church of that denomination), and who bore a most respectable character. Offley seems to have been kindly received by Mr Carr, and he formed the wish to live with him till he should become of age. Mr Reed, on the other hand, became alarmed about the conduct of his pupil, and sent a servant to make repre-

* London: Pickering. 1841.

sentations on the subject to the guardians. The young man lost no time in writing to them, for his own defence, against the charges he imagined might be brought against him. According to Mr Hunter, he anticipated that one of these charges would be, that he spent too much time at the billiard-table. 'In this letter he acknowledges that he has gone frequently, but that he has not lost to the amount of ten shillings during the whole time that he has been at Edinburgh; but he has gone the more frequently, that he might escape from the disagreeable company of Mr Reed; and, moreover, he has made the resolution that he will go no more. "Another possible objection that Mr Reed's artifice may suggest is, that I have too great a regard for a young lady at Mr Carr's; but I can hardly allow myself to think that Mr Reed can be capable of suggesting such a falsity, for I give you my word of honour that I never had, nor will have, the least intention to make my addresses there." He thinks that the profusion of his entertainments may be another charge; but he conceives that the entertainments he has given have been no more than a suitable return, from a gentleman of his station and fortune, for the civilities he receives. Mr Reed may allege that his letters have not been written by himself: he admits that he has been assisted, but that the sentiments have been all his own. Mr Reed may complain that he has paid no regard to his instructions; which he willingly admits to be perfectly true. In this letter he also informs his guardians that, since he left Mr Reed, he had put himself under the care of Mr Carr, and intends this winter to learn the French language, and prosecute such studies as Mr Carr shall recommend to him with greater application than he has ever done before.'

Other letters of Mr Offley show that he got upon bad terms with his guardians, and continued firmly attached to Mr and Mrs Carr, notwithstanding all remonstrances. The favour of the Duke of Argyle, and his own pretensions as a young man of large fortune, obtained him access to the best society. He passed his time very agreeably in the Scottish capital; but appears gradually to have contracted prejudices against his friends in England, not even excepting his young and innocent sisters. In short, it is easy to see that he acted the usual part of a weak person, who has been thwarted in his wishes, and whose self-esteem has been offended. Resentment in such a case involves all who do not profess to sympathise.

In February or March 1754, young Offley attained his majority, and immediately cut off any entail of the family property, if there were any, which interfered with his absolute control over it. On the 21st of June he executed a will (writing it with his own hand, according to a correct form which had been furnished to him), making Mr Carr the sole executor, and giving to him and Mrs Carr the whole of his real estate and personal property—the former of which was worth two thousand a-year. Two months after, he departed this life—cut off, it is supposed, by a rapid fever.

According to Mr Hunter—'When the news arrived in Derbyshire that the young ladies, the sisters of Mr Offley, were deprived of the family fortune, there was one general burst of indignant feeling. The Duke of Devonshire, great-grandfather of the present duke, is reported to have said that there could not have been a power in Mr Offley thus summarily to alienate the ancestorial property, and that he would spend L.10,000 rather than the daughters of his good friend Mr Offley should be despoiled of their inheritance. In the common mind, suspicions immediately arose of unfair dealing. The date of the will and the date of the death were compared. He was alone, in the hands of the parties to be so largely benefited by his death; no friend of the family to watch over him. A criminal neglect of the use of proper remedies was openly imputed to the persons in whose house he died. Even unfair dealing of a more active kind was more than insinuated by persons who could have had no means of correct information; and, particularly, the lady of the family was elevated by the popular voice into a species of Lady Macbeth.'

'The popular impression,' says Mr Hunter, 'was deepened by the solemn asseveration of the gardener, who was put in charge of the premises, that he actually saw his master enter the hall on the very day, if not the very hour, when, as it was afterwards found, he had died at Edinburgh.'

Mr Ward, in his fictitious narrative, makes this last event appear as an interposition of Providence, to excite a certain old friend of the family to exertions in behalf of the Misses Offley. 'But,' says Mr Hunter, 'one cannot but feel how poor and mean is the object contemplated. What can it signify to whom the use shall be given of the produce of a few acres of land in this corner of the world, or even whether a guilty person shall not be suffered to escape punishment, when hundreds of guilty persons do actually escape? A night's debate on the floor of the House of Commons, and the vote which follows it, are of ten thousand times the importance of all the restitutions and all the detections which have been effected by these supposed peculiar acts of Providence in the last thousand years: and all this without a ghost. And yet what are even these and their effects when looked at in connexion with the vast scheme of the All-comprehending Mind?'

Mr Hunter further shows that the friend in question, a Mr Newton, was a man of much native energy, requiring no such stimulus to induce him to act for the young ladies. We now proceed with Mr Hunter's narrative. 'Having obtained such powers as the guardians could give him, Mr Newton proceeded at once to Edinburgh. He took my grandfather with him, who often accompanied him on his journeys. Mr Girdler had only a few hours' notice, and was not informed beforehand of the place of destination, or the object of the journey. But all this was unfolded as they travelled; and Mr Girdler was given to understand that Mr Newton had arranged the whole plan of operations, and that his business was to observe the proceedings, but to take no part in them.

'One incident only occurred upon the road which requires notice. They met the corpse of Mr Offley at Ferry-bridge; when Mr Newton, who had a very commanding figure, assuming his most dignified air, and producing the paper of authority which the guardians had given him, so awed the persons who had the care of the body, that they consented to let it remain at the inn till Mr Newton should return from Edinburgh, and give further directions concerning it.

'They travelled with great rapidity; and, considering the state of the roads, and the time which must have been required for the negotiation at Edinburgh, what Mr Shore relates is one of the more remarkable circumstances of the story—that Mr Newton called at his father's house, between Norton and Sheffield, on the Sunday on which he started, and again on the succeeding Sunday, when he had returned.

'Mr Newton's first step on his arrival was to secure a legal friend, to whom he might apply for advice if wanted, and to draw up the instruments which might be required; his next, to proceed to the house of Mr Carr. He was admitted without reserve, and allowed to enter on his business; Mr Carr only calling in the assistance of a lawyer. Mr Newton had no one with him but Mr Girdler. The conference lasted, as I have heard, several hours. The arguments which Mr Newton used arose out of objections, as was conceived, to the validity of the will, and doubts of the young man's having possessed such entire command over the property, that he was able, by so simple an act, to turn it from the natural course of descent. He urged the certainty that every effort would be made to recover the estates to the family, the Miss Offleys having many powerful friends, who would afford them all the means requisite to defeat a purpose so unjust and cruel; and that he, for his part, having a large unencumbered

estate, would carry the cause through every court that was accessible; so that, if they persisted in holding the estates, it must be with the certainty of years of disquietude and the most harassing opposition. He set before them the extreme hardship of the case, and the obloquy which always attaches even to parties perfectly innocent of anything wrong, who yet are seen in the possession of that which is theirs only by an act of caprice and injustice. He showed the peculiar aggravations in this case, where the young man had lived in their house, had made the will while living there, no friend being cognisant of the act, and then so soon dying under their roof. He went so far, I have heard, as to say that the most rigid inquiry would be made into the circumstances under which the will was executed, and also into the manner of the death; and he urged, in a very forcible manner, how much better it would be for them, in their circumstances, to possess a few thousands unquestioned, and in peace, rather than the larger fortune which would come attended with contention and anxiety, and probably with obloquy, for the remainder of their days.

'At the close of the first day's conference, Mr Carr had consented to relinquish all claims under the will, and to accept of L.5000.

'At this point Mr Girdler could not forbear manifesting some sign of satisfaction. But Mr Newton had other thoughts, and, by a significant look, reminded Mr Girdler of the duty which was required of him. In fact Mr Newton had fixed in his own mind a much less sum than L.5000.

'He told Mr Carr that he could never consent to yield so large a sum, and that, if it were insisted upon, the negotiation might be considered at an end; that he should leave Edinburgh the next morning, and consult with the other friends of the family on what was to be done. The other party evincing no disposition to make any reduction, Mr Newton took his leave; but when he had reached the doorway or passage of the house, he returned into the room, as if he had suddenly recollected a circumstance of secondary or very minor importance, and coolly inquired if they had any directions to give respecting the corpse. Mr Carr immediately expressed his persuasion that it was already buried; when Mr Newton related, for the first time, how he had stopped the procession at Ferry-bridge, and that the corpse was then there awaiting examination. This I have heard represented as the master-stroke of Mr Newton's diplomacy. He immediately left Mr Carr's house; and it was supposed to be the effect of this stroke which led Mr Carr to desire a second interview.

'At this second interview, the terms on which Mr and Mrs Carr agreed to relinquish their claims were soon settled; the sum agreed upon being L.2000.

'The agreement was immediately put into proper form. The will was delivered up to Mr Newton. He immediately left Edinburgh. When they were seated in the carriage, Mr Girdler is reported to have said, "Now I hope you are satisfied with yourself?" when Mr Newton threw up his hand and exclaimed, "This is worth living for!"

'The body of Mr Offley was then taken forward to Norton, where I find, by the parish register, that it was interred on the 24th day of September; thirty-four days after the death.'
